The last great efforts for union were made when the Saracens invaded and conquered the dissident provinces. A new formula of union was discovered (One Will and One Energy). This doctrine of monothelitism would never have been heard of but for political exigencies. The Egyptian and Syrian emperors, if it be possible, have accepted this compromise; but it was repudiated by the fanatical adherents of Chalcedon. Heraclius sought to impose the doctrine by an edict (Ecthesis, 638), but the storm, especially in Italy and Africa, was so great that ten years later an edict known as the Type was issued by Constans forbidding all discussion about the number of wills and energies. Constans was a strong ruler, and maintained the Type in spite of orthodox opposition throughout his reign. But the expediency of this policy passed when the Saracens were inexpugnably settled in their conquests, and in his successor's reign it was more worth while to effect a reconciliation with Rome and the West. This was the cause of the 6th Ecumenical Council which condemned monothelitism (680-681).

In the Hellenic parts of the Empire devotion to orthodoxy served as a chrysalis for the national sentiment which was to burst its shell in the 10th century. For the Greeks Christianity was identified almost certainly with paganism. It might be said that the old deities and heroes who had protected their cities were still their guardians, under the new form of saints (sometimes imaginary) and archangels, and performed for them the same kind of miracles. Pagan idolatry was replaced by Christian image-worship, which by the Christians of many parts of Asia Minor, as well as by the Mahomedans, was regarded as simply polytheism. Thus in the great iconoclastic controversy, which distracted the Empire for nearly 120 years, was involved, as in the monophysitic, the antagonism between different racial elements and geographical sections. Leo III., whose services as a great deliverer and reformer were obscured in the memory of posterity by the ill-fame which he won as an iconoclast, was a native of Comagene. His first edict against the veneration of pictures evoked riots in the capital and a revolt in Greece. The opposition was everywhere voiced by the monks, and it is not to be overlooked that for many monks the painting of sacred pictures was their means of existence. Leo's son Constantine V. pursued the same policy with greater vigour, meeting the monastic resistance by systematic persecution, and in his reign a general council condemned image-worship
(753). Iconoclasm was supported by the army (i.e., Asia Minor), and a considerable portion of the episcopate, but it was not destined to triumph. When the Athenian Irene, wife of Leo IV., came to power after her husband’s death, as regent for her son Constantine VI., she secured the restoration of the worship of icons. The Iconoclastic Council was reversed by the 7th Ecumenical Council of 787. The iconoclastic party, however, was not yet defeated, and (after the neutral reign of Nicephorus II.) came again to the helm in the reigns of the Armenians Leo V. and the first two Phrygian emperors, Michael II. and Theophilus. But the Empire was weary of the struggle, and on the death of Theophilus, who had been rigorous in enforcing his policy, icon-worship was finally restored by his widow Theodora (843), and the question was never reopened. This was a triumph for the Greek element in the Empire; the “Sunday of orthodoxy on which iconoclasm was formally condemned is still a great day in the Greek Church.

The ablest champions who wielded their pens for the cause of icons, defending by theological arguments practices which really had their roots in polytheism, were in the early stage John of Damascus and in the later Theodore (abbot of the monastery of Studium at Constantinople). The writings of the iconoclasts were enforced by the triumph of orthodoxy, so that we know their case only from the works of their antagonists.

In this struggle the Greeks and Latins were of one mind; the image-worshippers had the support of the Roman see. When the pope resisted him, Leo III. consecrated the papal estates in Sicily and Calabria; and the diocese of Ilyricum was withdrawn from the control of Rome and submitted to the patriarch of Constantinople. But when iconoclasm was defeated, there was no question of restoring Ilyricum, nor could there be, for political reasons; since the iconoclastic schism had, with other causes, led to the detachment of the papacy from the Empire and its association with the Frankish power. By the foundation of the rival Roman Empire in 800 the pope had definitely become a subject of another state. Nor sooner had the iconoclastic struggle terminated than differences and disputes arose between the Greek and Latin Churches which finally led to an abiding schism, and helped to foster the national self-consciousness of the Greeks. A strife over the patriarchal chair between Ignatius (deposed by Michael III. and supported by Rome) and Photius the learned statesman who succeeded him, strained the relations with Rome; but a graver cause of discord was the papal attempt to win Bulgaria, whose sovereign Boris had been baptized under the auspices of Michael III. (c. 863), and was inclined to play Old Rome against New Rome. Photius stood out as the champion of the Greeks against the claim of the Roman see, and his patriarchate, though it did not lead to a final breach, marks the definite emancipation of the Greeks from the spiritual headship of Rome. This is the significance of his encyclical letter (867), which formulated a number of differences in rite and doctrine between the Greek and Latin Churches, differences so small that they need never have proved a barrier to union, if on one side there had been no question of papal supremacy, and it is the more remarkable that he has not become the expression of a tenacious nationality. There was a reconciliation about 900, but the Churches were really estranged, and the open and ultimate breach which came in 1054, when the influence of the Cluni movement was dominant at Rome (Leo IX. was pope and Michael Cerularius patriarch), sealed a division which had long existed. Subsequent plans of reunion were entertained by the emperors merely for political reasons, to obtain Western support against their foes, or to avert (through papal influence) the aggressive designs of Western princes. They were doomed to futility because they were not seriously meant, and the Greek population was entirely out of sympathy with these political machinations of their emperors. The Union of Lyons (1274) was soon repudiated, and the last attempt, the Union of Florence in 1439, was equally hollow (though it permanently secured the union of the Rumanians and of the Ruthenians). Part of the historical significance of the relations between the Greek and Latin Churches lies in the fact that they illustrate, and promoted by way of challenge, the persistence of Greek national self-consciousness.

The emperors legislated against paganism and against heresy, not merely under ecclesiastical pressure, but because they thought religious uniformity politically desirable. Theodosius the Great, a Spaniard, with no sympathy for Hellenic culture, set himself the task of systematically eradicating pagan institutions and customs. Though his persecution accomplished much, paganism was far from being extinct either in the East or in the West in the 5th century. Not only did heathen cults survive in many remote districts, but the old gods had many worshippers among the higher classes at Rome, Constantinople, Antioch, Alexandria and Athens. The most distinguished Greek literati of that period were non-Christian. Justinian, who united theological enthusiasm with belief in the ideal of uniformity and, like Theodosius, was cut of sympathy with Hellenism (“Hellen” now came to mean “pagan”), persecuted polytheism more earnestly and severely than his predecessors. His measures were created a panic among the higher classes at Byzantium, of whom many, as he suspected, were addicted to the ancient religion. He instituted a regular inquisition, exacted oaths of orthodoxy from all officials and teachers, and closed the philosophical schools of Athens. Missionaries (and it is remarkable that he employed monophysite heretics) were sent to abolish the old heathen worship which survived in many parts of Asia Minor where Christianity had hardly penetrated. By the end of the 6th century formal paganism had practically disappeared.

In Asia Minor, especially in the east, there were many dissident communities which asserted independence of the Church of Constantinople and of all ecclesiastical traditions, founding their doctrines directly on the Bible. Most important of these heretics were the Paulicians (q.v.), a dualistic sect whom the Church regarded as Manicheans.

The Autocracy and its Constitutional Forms.—With Diocletian the Principate of Augustus had become undisguisedly an absolute monarchy, and this constitution prevailed to the end. There is virtually no constitutional history in the proper sense of the term in the later Roman Empire, for there was neither evolution nor revolution. The monarchical system remained in all its essential points unchanged, and presents a remarkable example of an autocracy of immense duration which perfectly satisfied the ideas of its subjects. No attempt was made to alter it,—to introduce, for instance, a limited monarchy or a republican government; all revolts and conspiracies were aimed at the policies of particular autocrats, not at autocracy itself; generally they only represented sectional antagonisms and personal ambitions. The emperors inherited a deeply rooted instinct of legality as a tradition from Old Rome; and this respect for law which marked their acts, along with the generally good administration of justice, was a palladium of the monarchy. They were supreme in legislation as well as in the administrative and judicial spheres; but they were on the whole moderate in wielding legislation as an instrument of policy.

There were, however, recognized constitutional principles which it would have been impossible for the emperor to override.

(1) The elective principle, inherited from the Republic, was never changed. A new emperor had to be elected by the Senate and acclaimed by the people. The succession never became automatic. But even Augustus had indirectly introduced the dynastic principle. Theodosius the Great, by causing his two sons, Arcadius and Honorius, to be elected Augusti in their infancy, practically elevated the dynastic idea into a constitutional principle; henceforward it was regarded as in the regular course that the son born to a reigning sovereign should in his infancy be elected Augustus. Thus the election, though always an indispensable form, was only a reality when a dynasty came to an end.
(2) When the position of Christianity was assured by the failure of Julian's reaction, it was evident that profession of that religion would henceforward be a necessary qualification for election to the throne. This was formally and constitutionally recognized when the coronation of the emperor by the patriarch was introduced in 457, or perhaps in 450.

(3) The sovereignty of the emperor was personal and not territorial. In this respect it always retained the character which it had inherited as the offspring of a Roman magistracy. Hence no Roman territory could be granted by the emperor to another power. For instance, the Western emperor Conrad III could promise to hand over Italy to Manoel Conmenus as the dowry of his wife, but it would have been constitutionally illegal for Manoel to have made such a promise to any foreign prince; an Eastern emperor had no right to dispose of the territory of the state. Tendencies towards a territorial conception began indeed to appear (partly under Western influence) in the time of the Paleologi, especially in the custom of bestowing appanages on imperial princes.

(4) While the senate of Rome generally lost its importance and at last became a mere municipal body, the new senate of Constantine preserved its position as an organ of the state till the fall of Constantinople. For the imperial elections it was constitutionally indispensable, and it was able sometimes to play a decisive part when the throne was vacant—its only opportunity for independent action. The abolition, under Diocletian's system, of the senatorial provinces deprived the senate of the chief administrative function which it exercised under the Principate; it had no legislative powers; and it lost most of its judicial functions. It was, however, still a judicial court; it tried, for instance, political crimes. In composition it differed from the senate of the Principate. The senators in the 4th century were chiefly functionaries in the public service, divided into the three ascending ranks of clari, dux, and illustres. The majority of the members of the senatorial order lived in the provinces, forming a provincial aristocracy, and did not sit in the senate. Then the two lower ranks ceased to have a right to sit in the senate, which was confined to the illustres and men of higher rank (Patricians). The senatorial order must therefore be distinguished from the senate in a narrower sense; the latter finally consisted mainly of high ministers of state and the chief officials of the palace. It would be a grave mistake to understate the importance of this body, through an irrelevant contrast with the senate of the Republic or even of the Principate. Its composition ensured to it a great influence as a consultative assembly; and its political weight was increased by the fact that the inner council of imperial advisers was practically a committee of the senate. The importance of the senate is illustrated by the fact that in the 11th century Constantine X., in order to carry out a revolutionary, anti-military policy, found it necessary to alter the composition of the senate by introducing a number of new men from the lower classes.

(5) The memory of the power which had once belonged to the populus Romanus lingered in the part which the inhabitants of New Rome, and their representatives, played in the elections, new emperors, and in such ceremonies as coronations. In the 6th century the factions ("demes") of the circus, Blues and Greens, appear as political parties, distract the city by their quarrels, and break out in serious riots. On one occasion they shook the throne ("Nika" revolt, 532). The emperors finally quelled this element of disturbance by giving the factions a new organization, under "de-marchs" and "democrats," and assigning them a definite quasi-political locus standi in the public ceremonies in the palace and streets. The duty of providing paniem des circes was inherited from Old Rome, but the free distribution of bread was no longer traceable beyond the 6th century (had the loss of the Egyptian granary to do with its cessation?), while the spectacles of the hippodrome lasted till the end.

Outside the capital the people took little interest in politics, except when theology was concerned; and it may be said generally that it was mainly in the ecclesiastical sphere that public opinion among the masses, voiced by the clergy and monks, was an influence which made itself felt.

The court ceremonial of Constantinople, which forms such a market contrast to the ostentatiously simple establishments of Augustus and the Antonines, had in its origin a certain constitutional significance. It was introduced by Aurelian and Diocletian, who wished to resuscitate that splendor and elegance which had marked ancient Rome, but without restoring it. Hence, in order to dissociate the emperor from the army, at a time when the state had been shaken to its foundations by the predominance of the military element and the dependence of the soldiery on the emperors, the ceremonies were designed to make him independent of all, with no more particular relation to the army than to any other element in the state; the royal court and the inaccessibility of the ruler were calculated to promote the dignity of the person, to remove the emperors from the sordid life of the streets, and the effeminacy of the palace was to be contrasted with the roughness of the army. The ceremony was introduced by Justinian, and were diligently maintained and developed. The public functions, which included processions through the streets to various sanctuaries of the city on the great feast-days of the Church, and the solemn entry of the emperors into the Great Palace, were never repeated; and it did not escape the wit of the emperors the splendid functions and solemn etiquette of the court were an effective means of impressing the imagination of foreigners, who constantly resorted to Constantinople from neighbouring kingdoms and dependencies, with the majesty and power of the Basileus.

The imperial dignity was collegial. There could be two or more emperors (imperatores, basiliici) at the same time; edicts were issued by either of them, and acts were done in their names through the period of dualism, in the 4th and 5th centuries, when the administration of the Eastern provinces was generally separate from that of the Western, the imperial authority was also collegial. But the period of dualism was to an end and was never renewed. There was frequently more than one emperor, not only in the case of a father and his sons, or of two brothers, but also in the case of a minority, when a regency or co-emperor (e.g. Leo I., Justin II., Constantius, Tiberius, John Zimisces). But one colleague always exercised the sole authority, was the real monarch, the "great" or the "first" Basileus; the other or others were only sleeping partners. Under the Comneni a single figure appeared in all the titles introduced; a brother, e.g. who before would have become the formal colleague of the ruler, received the title of Sebostator (Sebastos was the Greek equivalent of Augustus).

Legislation.—The history of the legislation of the Eastern Empire is distinguished by three epochs associated with the names of (1) Justinian, (2) Leo III., (3) Basil I. and Leo VI.

(1) The Justinianean legislation (see JUSTINIAN) is thoroughly Roman in spirit, and inspired by pious adhesion to the traditions of the past; but it admitted modifications of the older law in so far as consistent with the laws of the Church. In a period of dualism, in the 4th and 5th centuries, when the administration of the Eastern provinces was generally separate from that of the Western, the imperial authority was also collegial. But the period of dualism was to an end and was never renewed. There was frequently more than one emperor, not only in the case of a father and his sons, or of two brothers, but also in the case of a minority, when a regency or co-emperor (e.g. Leo I., Justin II., Constantius, Tiberius, John Zimisces). But one colleague always exercised the sole authority, was the real monarch, the "great" or the "first" Basileus; the other or others were only sleeping partners. Under the Comneni a single figure appeared in all the titles introduced; a brother, e.g. who before would have become the formal colleague of the ruler, received the title of Sebostator (Sebastos was the Greek equivalent of Augustus).

(2) Justinian's reign was followed by a period in which juristic studies decayed. The seventh century, in which social order was generally disturbed, left a blank in legal history, and it would seem that the law of Justinian, though it had been rendered into Greek, almost ceased to be studied or understood. Practice at least was modified by principles in accord with the public opinion of Christian times. Justinian's influence continued to be held at Constantinople in the reign of Justinian II. numerous rules were enacted, differing from the existing laws and based on ecclesiastical doctrine and Moslem principles, and these were sanctioned by the standing of the head of the Church. Hence the decline of Roman tradition, in a state which had become predominantly Greek, determined the character of the ensuing legislative epoch under the auspices of Leo III., whose law book (A.D. 732) is often intrinsically less simple and less written in the interests of the community. Entitled a "brief selection of laws" and generally known as the Ecloga, it may be described as a Christian law book. In regard to the patrocinum poestas increased facilities are given for emancipation from servitude when the master born his master. In the same year, when the premises or the possession of the lord was sold, the servile property was sold with it, and the servile tenant, who was to a certain extent replaced by a parental control over minors. The law of guardianship is considerably modified. The laws of marriage are transformed under the influence of the Church; the institution of consubstantiation is abolished. Impediments to marriage on account of consanguinity and of spiritual relationship are multiplied. While Justinian regarded marriage as a contract, and therefore, like any other sale, capable of being dissolved, the Church now accepted the view that it was an indissoluble bond. Ecclesiastical influence is written
large in the criminal law, of which a prominent feature is the substitution of mutilation of various kinds for the capital penalty. Death is retained for some crimes, such as murder and high treason; other offences were punished by amputation (of hand, nose, &c.). This system (judged by the law in the New Testament, "if thine eye offend thee," &c.), though to modern notions barbaric, seemed a step in the direction of leniency; and it may be observed that the tendency to avoid capital punishment increased, and we are told that in the reign of Justin I. the death penalty in civil law was seldom inflicted. (The same spirit, it may be noted, is apparent in the usual, though by no means invariable, practice of Byzantine emperors to render dethroned rivals or members of a deposed dynasty amputated or blinded in an effort to force them to take monastic orders, instead of permitting them to return to the Church, which had its own system of penalties, exercised a great influence on the actual operation of criminal law, especially through the privilege of asylum (recognized by Justinian, but with many restricted applications) which was granted to Christian churches and is admitted without exceptions in the Ecloga.

(3) The last period of legislative activity under Basil I. and Leo VI. represents a reaction, in a certain measure, against the Ecloga and a return to Justinian. The Ecloga was too grand scale; but there was a great revival of legal study under Constantine IX., who founded a new law-school, and there were many learned specialists who wrote important commentaries, such as John Xiphilin (11th century), Theodore (12th century), and, of course, the civil code of 1075, which in its framing used the Napoleonic code for its model, professed theoretically to base its civil law on the edicts of the emperors as contained in the Hexapla of Justinian.

Administration.—Three principles underlie the administrative reform of Diocletian: the separation of civil from military functions; the formation of small provincial units; and the scalar structure which deepened on the interposition of the vicar of a diocese and the praetorian prefect between the provincial governor and the emperor. This system lasted unchanged for three and a half centuries. The few unimportant alterations that were made were in harmony with its spirit, until the reign of Justinian, who introduced certain reforms that pointed in a new direction. We find him combining some of the small provinces into large units, underlining the scalar system by doing away with some of the dioceses and vicars, and placing in some cases military and civil authority in the same hands. The chief aim of Diocletian in his general reform had been to secure central control over the provincial governments; the object of Justinian in these particular reforms was to remedy corruption and oppression. The provinces, which as a whole did not feel keenly the changes that were made by their policy, were hardly in themselves have led to a radical change; but they prepared the way for an administrative revolution, brought about by stress of external necessities. In the 7th century all the energies of the Empire, girt about by active enemies, were centred on war and defence; everything had to give way to military exigencies; and a new system was gradually introduced which led ultimately to the abolition of the old. The change began in Italy and Africa, at the end of the 6th century, where operations against the Lombards and the Berbers were impeded by the friction between the two co-ordinate military and civil authorities (masters of soldiers, and praetorian prefects). The military governors were made supreme with the title of ecazarch, "viceroys"; the civil authority was subordinated to them in case of collision, otherwise remaining unaltered. The change is an index of the dangerous crisis through which these provinces were passing. In the East similar circumstances led to similar results. The Saracen danger hanging imminent over Asia Minor imposed a policy of the same kind. And so before the end of the 10th century the Empire was divided into six great military provinces, three in Europe and three in Asia: (1) Exarchate of Africa, (2) Exarchate of Italy, (3) Strategia of Thrace, (4) County of Opsikion (= isoequum), including Bithynia, Honorius, Paphlagonia, parts of Hellespontus and Phrygia, (5) Strategia of the Anatolikoi, most of west and central Asia Minor, (6) Strategia of the Armeniakoi, eastern Asia Minor. In addition to these there was a naval circumscription, (7) the Strategia of the Karabasibaino (from kákoös, a vessel), including the southern coastland of Asia Minor, and the Aegean (see below under Navy).

The lands of the old prefecture of Illyricum were not included in the system, because this part of the Empire was then regarded as a lost possession. On the contrary, here military powers were created to the Prefect of Illyricum, whose actual sphere extended little beyond the Thessalonica, which was surrounded by Slavonic tribes.

The Eastern changes, perhaps initiated by Heraclius, but probably due mainly to Constans II., did not interfere with the civil administration, except in so far as its heads were subordinated to the military commanders. But Leo III., who as a great administrative reformer ranks with Augustus and Diocletian, did away with the old system altogether. (1) Reversing Diocletian's principle, he combined military and civil power in the same hands. The strategos or military commander (in the case of the very higher officers (turchans) were also civil functionaries. (2) The scalar principle disappeared, including both the vicars and the praetorian prefect of the East (some of whose functions were merged in those of the prefect of the city); no authority intervened between the strategi and the emperor. (3) The new provinces, which were called themes (the name marks their military origin: thema = corps), resembled in size the provinces of Augustus, each including several of the Diocletian divisions. This third and last provincial reform has, like its predecessors, its own history. The list of themes in the 11th century is very different from that of the 8th. The changes were in one direction—the reduction of large provinces by cutting off parts to form smaller themes, a repetition of the process which reduced the provinces of Augustus. Hence the themes came to vary greatly in size and importance. Leo himself began the process by breaking up the Anatolic command into two themes (Ahenes and Thessalonica), the principle of splitting up was carried out systematically by Leo VI. (who was also responsible for a new ecclesiastical division of the Empire).

It is important to note that up to Leo VI. the district between Constantinople and the wall of Anastasius formed a separate theme or province, which was removed later with the Ditch (Δ σθόρα) or the Ditch (Δ στάρα) of Leo VI. united it with the theme of Thrace.

In the central administration, the general principles seem to have remained unchanged; the heads of the great administrative bureaux in Constantinople retain the palatine character which belonged to most of them from the beginning. But there were many changes in these offices, in their nomenclature and the delimitation of their functions. There are great differences between the administrative corps in the 5th, in the 10th and in the 15th centuries. We can hardly be wrong in conjecturing that, along with his provincial reform, Leo III. made a rearrangement of the central bureaux; the abolition of the Praetorian Prefecture of the East entailed, in itself, modifications. But minor changes were continually being made, and we may note the following tendencies: (1) Increase in the number of ministers directly responsible to the emperor, (2) subordinate offices in the bureaux being raised to the rank
of independent ministries; (b) new offices being created and old ones becoming merely titular. (2) Changes in nomenclature; substitution of Greek for Latin titles. (3) Changes in the relative importance and rank of the high officials, both civil and military.

The Prefect of the City (συγκεκριμένος) controlled the police organization and administration of justice in the capital; he was vice-president of the imperial court of justice, and, when the office of Prefect of the East was abolished, he inherited the functions of that dignitary as judge of appeals from the provinces. But the praetorius vigiliae, commander of the city guards, who was subordinate to him, became an independent officer, entitled Drungary of the Watch, and in the 11th century superseded him as vice-president of the imperial court. We are told that in the last years of the Empire the Prefect of the City had no functions at all; but his office survives in the Sishir-imaneti, "city prefecture," of the Ottomans, in whose organization there are many traces of Byzantine influence.

Instead of the Quaestor of the Sacred Palace, whose duty was to draft the imperial laws and rescripts, we find in the 9th century a quaestor who possesses certain judicial and police functions and is far lower in the hierarchy of rank. It has been supposed that the later quaestor really inherited the duties of another officer, the quaestor, who was instituted by Justinian. In the latest period the quaestor, if he still existed as a name, had no functions.

The Master of Offices, who supervised the bureaux in the palace and was master of court ceremonies, also performed many functions of a minister of foreign affairs, was head of the imperial post (cursus), and of the corps of agents in rebus or Imperial Messengers. This ministry disappeared, probably in the 8th century, but the title was retained as a dignity at all events till the end of the 9th. The most important functions, pertaining to foreign affairs, were henceforward performed by the Logothete of the Post (λογοθέτης τοῦ ἄρχοντος). In the 12th century this minister was virtually the chancellor of the Empire; his title was changed to that of Great Logothete (μεγαλοβουλευτής).

The two financial ministers, comes sacrarum largitionum et comes rei privatae, continued to the end under the titles λογοθέτης τοῦ γενεσίου (General Logothete) and ὁ ἐπί τοῦ ἄρχοντος (Anastasius added a third, the Count of the Sacred Patrimony, but he was afterwards suppressed). But in the 9th century we find both these ministers inferior in rank to the Secellarius, or private pursekeeper of the emperor. Besides these there was a fourth important financial department, that of the military treasury, under a Logothete.

The employment of eunuchs as high ministers of state was a feature of the Byzantine Empire from the end of the 4th century. It is laid down as a principle (a.d. 990) that all offices are open to them, except the Prefecture of the City, the quaestorship, and the military posts which were held by "Domestics." There were then eight high posts which could only be held by eunuchs, of which the chief were the parakomomenos and the praetorius vigiliae (master of the wardrobe).

An emperor who had not the brains or energy to direct the affairs of the state himself, necessarily committed the task of guiding the helm to some particular minister or court dignitary who had gained his confidence. Such a position of power was outside the constitution, and was not associated with any particular office; it might be held by an ecclesiastic or a eunuch; it had been held by the eunuchs Eutropius and Chrysaphius in the reigns of Arcadius and Theodosius II. Respectively. In later times, such a first minister came to be denoted by a technical term, ὁ παράπληκτος. This was the position, for instance, of Stylianus, the father-in-law of Leo VI. Most of the emperors between Basil II. and Alexis Comnenus were under the influence of such ministers.

The orders of rank (which must be distinguished from titles of office) were considerably increased in later times. In the 4th and 7th centuries there were the three great classes of the offices, spectacles and clarissimae; and above the illustres a small, higher class of patricians. In the 9th century we find an entirely different system; the number of classes being largely augmented, and the nomenclature different. Instead of epithets like illustres, the names are titles which had designated offices; "patrician" alone survives. The highest rank is now (1) the magistriu; then come the patricians in two classes; (2) proconsular patricians, (3) respectable patricians not below these (4) praetorians, (5) diphysiptoi, (6) consules, (7) patricii, and other lower ranks. Particular ranks do not seem now to have been inalienably attached to particular offices. The strategos of the Anatolic Theme, e.g., might be a patrician or only a praetorius. Whoever was promoted to one of these ranks received its insignia from the emperor's hand, and had to pay fixed fees to various officials, especially to the palace eunuchs.

In the provinces ordinary justice was administered by judges (καράυα) who were distinct from the governors of the themes, and inherited their functions from the old provincial government of Diocletian's period. In Constantinople higher and lower courts of justice sat regularly and frequently. The higher tribunals were those of the Prefect and the Quaestor, both of whom different kinds of cases came. Appeals reached the emperor through the bureau of Petitions (τῶν ἀνήγγειλεν); he might deal with the case immediately; or might refer it to the imperial court of appeal, of which he was president; or else to the special court of the Twelve Divine Judges (δικαιοδοτικοὶ), which was instituted by Justinian.

While the administration of justice was one of the best features of the Eastern Empire, its fiscal system, likewise inherited from the early Empire, was one of its worst. If the government had been acquainted with the principles of public economy, which have not been studied till comparatively recent times, a larger revenue might have been raised without injuring the prosperity of the inhabitants. Taxes were injudiciously imposed and oppressively collected. The commerce of the Empire was based upon the great sources of strength, but the government looked on the merchants as a class from which the utmost should be extorted. The chief source of revenue was the land.

The main burdens which fell upon the landed proprietors throughout the whole period were the land tax proper and the annona. The land tax (capitatio terrae = the old tributum of the imperial, stipendium of the senatorial, provinces) was based, not on the yearly produce, but on the capital of the proprietor, the character and value of the land being taken into account. In later times this seems to have become the kastneion, or hearth tax. The annona was an additional impost for supporting the army and imperial officials; it was originally paid in produce. In later times, we meet it under the name of οἰκονομία or συνωσίς. The province was divided into fiscal districts, and the total revenue to be derived from each was entered in a book of assessment. The assessment was in early times revised every fifteen years (the indiction "period"), but subsequently was only revised as occasion might require. The collection of the tax was managed through the curial system, while it lasted (till 7th century?). The decurions, or municipal councillors, of the chief town in each district were responsible for collecting and delivering the whole amount, and had to make good the sums owed by defaulters. This system of collective responsibility pressed very heavily on the decurions, and helped to cause their decay in the Western provinces. After the abolition of the curial organization, the principle of collective responsibility remained in the form of the κριτίδα or additional charge; that is, if a property was left without an owner, the taxes for which it was liable became an extra charge on the other members of the district (οἱ ἄρμονοι). The taxes were collected by prastores, who were under the General Logothete. The peasant proprietors were also liable to burdens of other kinds (corvées), of which the most important was the furnishing of horses, vehicles, &c., for the state. The condition of the land ownership in the Eastern Empire still awaits a thorough examination. It may be noted that individual hereditary proprietorship was always the rule (on crown and monastic lands as well as in other cases), and that the commonly supposed extensive existence of communal possession in common is based on erroneous interpretation of documents. When imperial lands were granted to monasteries or to fiefs (σέβασμα), to individuals, the position and rights of the peasant proprietors on the estates were not changed, but in many
cases the imposts were paid to the new master instead of to the
fisc. In the 4th, 5th and 6th centuries the cultivators were attached
to the soil (colonii, ascripti; see SERFDOM), in the interests of the
fiscus; it has been supposed, on insufficient grounds, that this
serfdom was abolished for a time by Leo the Great. It is not
clear that the condition of the peasants was largely changed by the
invasions of the 7th century. In any case the system of compulsory
attatchment of peasants to their lands remained in force, and the
class of ascripti (ἐν κληρίναις) existed till the latest times. The
chiefs in the new condition of things represented the imperial
laws, monastic records, among which may be mentioned as specially
valuable those of the Monastery of Lemboi near Smyrna.

Army and Navy.—The general principle of the military
defence of the Empire in the 4th century consisted in large
forces stationary on the frontiers, and reserve forces, stationed
in the interior provinces, which could be moved to any point
that was in danger. Thus the army was composed of (1) the
limitanei, frontier-troops (under duxes), and (2) reserve forces
(under magistri militum) of two designations, (a) palatini
and (b) comitatenses. The limitanei were the more numerous;
it has been estimated that if they numbered about 350,000,
the comitatenses and palatini together amounted to less than
200,000. It is to be noted that for the old legion of 6000 men
besides the officer corps and engineers, there were 4000
comitatenses. In the 5th century the proportion of cavalry to
infantry was small. In the 6th century the fundamental principles of the system were the same; but the
cavalry had become a much more important branch of the
service, and in the wars of Belisarius the foederati, barbarian
mercenaries of various races, commanded by their own chiefs,
played a great rôle. The peasants of Illyria and Thrace, the
mountaineers of southern Asia Minor still supply an important
part of the army, but the number of barbarians (Heruli, Vandals, Goths, Slavs, Arabs, &c.) is much larger. Solidity and
a corresponding want of mobility characterized at this time
both cavalry and infantry; their great merit was straight and
rapid shooting: Belisarius ascribed his success in Italy to the
excellence of the archery. It is remarkable that with small
forces (not more than 25,000) the first conquest of Italy was
achieved, though Belisarius was far from being a military genius
and the discipline in his army was flagrantly defective.

Frontier Defences.—Justinian carried out on the frontiers and in
the exposed provinces a carefully devised and expensive system
of defensive works. Fortified towns along the times were connected
by intervening forts, and at some distance behind was a second
line of more important fortresses more strongly garrisoned, which
furnished both a second barrier and places of refuge for the inhabitants
of the country. The signal system was carefully contrived, the signals
by which the garrisons of the front stations could announce
not only the imminence of a hostile invasion, but the number
and character of the enemy. In North Africa there are abundant
remains of these signal stations, forming a line of military architecture of the period and the general frontier system.

The typical fortress had three defences: the wall flanked by square
towers of three storeys; at a few yards' distance a second wall of
stone; and outside a deep ditch about 20 yds. wide, with vertical
sides, filled with water, and along its edge a rampart of earth.

We have already seen how the disasters and losses of the 7th
century led to a radical change in the military organization, and
how in the time of Anastasius I., that of Basili II., and of Leo
the Great, the influence which Asia Minor won and retained till the 11th century is reflected in the military establishment, which mainly depended on the
Asiatic provinces. The strategos of a large theme commanded a
corps of 10,000 and the scheme of the divisions and subordinate
commandants has a resemblance to the organization of
some of the armies of modern Europe.

The recorded scheme was probably not uniform in all the themes,
and varied at different periods. The Theaum (corps) consisted of
2 turmae each of 2 turmis (950 men), each turma of 15
exarxiai (companies), each under a dromianus (colonel); the band of 5 pentarkhias (companies) under a komite (captain). The pentarkhias,
containing 200 men, had 5 subdivisions under pentekontakias
(companies), each formed of 20 men under their dekarkhias (corporal). The total strength in the 9th century was
120,000; in Justinian's time it was reckoned at 150,000.

Distinct from the military forces (milia) of the provinces were the
forces (exarxia) stationed near or near large towns, the most
important of these were the Scholae and the Excubitors. The
Scholarioi troops were in early times under the Master of Offices,
but subsequently their chief officer, the Domestic of the Schools,
became the highest military commander in the Empire next to the
Strategus of the Anatolic Theme. In 523, when not assuming
the chief command himself, he might entrust it to any
commander, and he often entrusted it to the Domestic. In the
11th century, after the conquest of Bulgaria, there were two
Domestics, one for the east and one for the west, and under
Alexius Comnenus the Domestic of the west received the title Great
Domestic, and he might also be the captain of the Hundred. Though the Great Domestic was superior in rank to all other ministers.

Besides the Scholarioi, and the Excubitors (who had been
organized in the 5th century), there were the regiments of the
Hikanatoi, the Arachmos and the Numeri. The Numeri were
composed of horsemen, and the Hikanatoi was in the same category, though they were constituted as a theme. It is
to be observed that the demes or corporations of Constantinople
were partly organized as militia, and were available for purposes of
defense.

The great difference between this Byzantine army and that of the
earlier Empire is that its strength (like that of the feudal armies of the West) lay entirely in cavalry, which the successors of Heraclius, in theheyday of the limes, had so greatly perfected. The few contingents of foot were quite subsidiary. The army was free
from the want of discipline which was so notable in the 6th century; it was maintained in Asia Minor, which was the great recruiting ground, by a system of military holdings of land (an
extension of the system of assigning lands in the frontier districts to federate barbarians and to veterans). The conditions of the marauding expeditions and guerilla warfare, continuously
continued on and by the Saracens in the 8th, 9th and 10th centuries,
remained essentially the same, and when we possess the theory of the Byzantine methods in a treatise
composed by the emperor Nicephorus Phocas, and edited by one of his pupils. Every detail of an incursion into Saracen territory is regulated.

In the 9th and 10th centuries the Saracens, with an approach Saracen incursion was announced to Constantinople
from the Cilician frontier. The news was flashed across Asia Minor by eight beacon fires. The first beacon was at Lulon (which
commanded the border of the saurian province of Cappadocia), the last
was on Mt. Auxentius in Bithynia. When this fire appeared, a light
was kindled in the pharos of the imperial palace at Constantinople.
The system was discontinued in the reign of Michael III., probably
after the capture of Lulon by the enemy in 866, and was not
renewed. When Lulon had been recovered it was noticed that
this famous telegraphic system was only an application on a
large scale of the frontier signalling referred to above.

The loss of a great part of Asia Minor to the Seljuks, and the
disorganization of the provinces which they did not acquire, chiefly
weakened the army, and the emperors had recourse more and more
to foreign mercenaries and barbarian auxiliaries. The employment
of Scandinavians had begun in the 10th century, and in 968 was
formed the Vangr alog, a body of barbarians, many of whom,
were trained, who in the 10th century were the terror of the
enemy. The particular tactics of the various foes whom they had to face
were critically studied. We have a series of military text-books,
from the time of Anastasius I. to that of Basili II., from which
we can learn their principles and methods. In this army there was plenty
of courage, and distinct professional pride, but no love of fighting
for fighting's sake, nor the spirit which in western Europe developed
the characteristic of barbarians who had physical strength and no brains.

The object of a good general, as Leo VI. shows in his important
Tactics, was in their opinion not to win a great battle, but to
attain success without the risks and losses of a great battle. The
commander in chief was the architect of the plan, and was
a tribute to their fearlessness, he points out their want of discipline,
the haphazard nature of their array and order of battle, their
eagerness to attack before the word was given, their want of faculty
for system, and the incompetence of the subordinate officers on
difficult ground, the ease with which they could be deceived
by simple artifacts, their carelessness in pitching camps, and their
lack of a proper intelligence department. These criticisms, borne
out of practical experience, are a severe check to the theory
of a western host, with its three great "battles," rushing headlong
at the foe, and the Byzantine army, with its large number of
small units, cooperating in perfect harmony, under a commander
who had been trained in military science, had a definite plan in
his head, and could rely on all his subordinates for strict and intelligible
Under the early Empire, as Rome had no rival in the Mediterranean, it was natural that the navy and naval theory should be neglected. When Constantine the Great decided to besiege Byzantium by sea, both he and his opponent Licinius had to create fleets, which in later centuries transmuted into navies and became a naval power, the Romans did not seriously address themselves to building an efficient navy and securing their own thalassocracy; the Vandals harried their coasts; their fleets were defeated at sea, while the navy itself was neglected. When power was in its decline and Belisarius set forth on his successful expedition of conquest, his fears for the safety of his squadron in case he should be attacked at sea allow us to suspect that the fleet of the east was superfluous to the Romans; the state, however, was so compro-}

mental, the imperial government not being much concerned with the struggle for its being, to organize an efficient fleet. Thus, as we saw, it was the work of Constans II., and we saw what it achieved. In this first period (c. 650-720) the naval forces, designated as the Karabianoi, were placed under the command of an admiral, with the title of strategos. They consisted of two geographical divisions, each under a dux: the province of the Cibyrrhaeots (probably named from the smaller Cibyra in Paphlagonia) which included the southern coast districts of Asia Minor, and the Aegean province, which embraced the islands and part of the west coast of Asia Minor. The former was the more important; the marines of this province were the hardy descendants of the pirates, whose subjugation had been one of the chief reasons for the establishment of the early Roman government of the Republic. It was a new idea to impose the burden of naval defence on the coast and island districts. Distinct from these fleets, and probably organized on a different principle, was the naval component of the Byzantine land army, a modified version of the III. Ramses, the administration, abolishing the supreme command, and making the Cibyrrhaeo and Aegean provinces separate independent themes under strategoi. The change was due to two motives. There was a desire for centralization of what was already a powerful (indicated in the political rôle played by the navy before Leo's accession); but apart from this, the general reform of the navy, which united civil and military powers in the same hands, naturally placed the naval commander in the front line of events, and the pressure of events forced the foot soldiers, by making them provincial governors. In this and the following reigns, the tendency was to neglect the fleet; the interest of the government was concentrated on the army. For a time this was in the hands of a general of the old Imperial style, and the dynasty was growing weak, and then under the Abbasids, who transferred the capital from Damascus to Baghdad, the sea-power of the caliphate declined. But the neglect of the fleet was avenged in the 9th century, when Crete and Sicily were wrested from the Empire, the loss of south Italy was imminent, and Moslem squadrons sailed in the Adriatic, —looses and dangers which led to a reorganization of the navy under Basili I. and Leo VI. After this reformation, the forces consisted of the main Imperial fleet (stationed at Constantinople), and the provincial fleets, three in number, of (a) Cibyrrhaeo theme, (b) Aegean theme, (c) theme of Samos. A small distinct contingent was supplied by the sea-dogs, who plundered the coasts of the Black Sea. In the same century, the emperors undertook the defense of the coasts by building a fleet of biremes, or two-oared ships (vexillationes). Pyrotechnic was an important department in the naval establishment; the manufacture of the terrible explosive known as liquid or marine fire (see GREEK FIRE) was carefully guarded as a state secret.

The navy, active and efficient in the 10th century, is described by a military and therefore unprejudiced officer of the 11th as the glory of the Byzantine government. But towards the end of the 11th century it deca- 

Diplomacy.—In protecting the state against the barbarians who surrounded it, diplomacy was a weapon as important in the eyes of the Byzantine government as soldiers or fortifications. The peace on the frontiers was maintained not only by strong military defences, but by less or more skilful management of the frontier peoples. In the later Empire this kind of diplomacy, which we may define as the science of managing the barbarians, was practised as a fine art; its full development was due to Justinian. Its methods fall under three general heads. (1) One people was kept in check by means of another. The imperial government fomented rivalry between them. Thus Justinian kept the Geopae in check by the Lombards, the Kuturgurs by the Utigurs, the Huns by the Avars. (2) Subsidies were given to the peoples on the frontiers, in return for which they undertook to defend the frontier against them, and to supply fighting men when called upon to do so. The chiefs received honours and decorations. Thus the Berber chiefs on the African border received a staff of silver, encrusted with gold, a silver diadem, white cloak, embroidered tunic, &c. More important poten- 

In the 10th century we have again the means of observing how the government conducted its foreign policy on carefully

ROMAN EMPIRE, LATER
thought out principles. The Empire was then exposed to constant danger from Bulgaria, to inroads of the Magyars, and to attacks of the Russians. The key to the diplomatic system, designed to meet these dangers, was the cultivation of friendly relations with the Petchenegs, who did not menace the provinces either by land or sea and could be incited to act against Russians, Bulgarians or Magyars. The system is explained in the treatise (known as De administrando imperio) composed by the emperor Constantine Porphyrogennetos (c. 950). The series of these northern states was completed by the kingdom of the Khazars (between the Caucasus and the Don), with which the Empire had been in relation since the time of Heraclius, who, to win its co-operation against Persia, promised his daughter in marriage to the king. Afterwards the Khazars gave two empresses to New Rome (the wives of Justinian II. and Constantine V.). Their almost civilized state steered skilfully between the contending influences of Islam and Christianity, and its kings adopted the curious means of avoiding suspicion of partiality for either creed by embracing the neutral religion of the Jews. Commercial and political relations with the Khazars were maintained through the important outpost of the Caucasian on the Crimea, which had been allowed to retain its republic, free from taxation and under the protection (spareriu) and municipal board (hgyaeres), though this freedom was limited by the appointment of a strategos in 813, a moment at which the Khazars were seriously threatened by the Petchenegs. The danger to be feared from the Khazars was an attack upon Cherson, and it seems probable that this was a leading consideration with Leo III. when he wedded his son Constantine V. to a Khazar princess. In the 9th century it was an object of the government to maintain the Khazars (whose army consisted mainly of mercenaries) against the Petchenegs; and hence, if it should become necessary to hold the Khazars in check, the principle was to incite against them not the Petchenegs, but other less powerful neighbours, the Alans of the Caucasus, and the people of "Black Bulgaria" on the middle Volga (a state which survived till the Mongol conquest).

For this systematic diplomacy it was necessary to collect information about the peoples whom it concerned. The ambassadors sent to the homes of barbarous peoples reported everything of interest to the court. We owe to Priscus a famous graphic account of the embassy which he accompanied to the court of Attila. We possess an account of an embassy sent to the Turks in Central Asia in the second half of the 6th century, delivered from an official report. Peter the Patrician in Justinian's reign drew up careful reports of his embassies to the Persian court. When foreign envoys came to Constantinople, information was elicited from them as to the history and domestic politics of their own countries. It can be shown that some of the accounts of the history and customs of neighbouring peoples, stored in the treatise of Constantine Porphyrogennetos referred to above (furnishing numerous facts not to be found anywhere else), were derived from barbarian ambassadors who visited Constantinople, and taken down by the imperial secretaries. We may conjecture with some probability that the famous system of the Relazioni, which the Venetian government required from its ambassadors, goes back originally to Byzantine influence.

ROMANES, GEORGE JOHN (1848—1894), British biologist, was born at Kingston, Canada, on the 20th of May 1848, being the third son of the Rev. George Romanes, D.D., professor of Greek at the university of that town. He was educated in England, going in 1867 to Graveland and Caius colleges, Cambridge. He early formed an intimate friendship with Charles Darwin, whose theories he did much during his life to popularize and support. When studying under Sir J. Burdon Sanderson at University College, London, in 1874—76, he began a series of researches on the nervous and locomotor systems of the Medusae and Echinodermata, which provided him with material for his Croonian lecture in 1876. Subsequently he continued the inquiry, partly in conjunction with Professor J. Cossar Ewart, and the results were published in Jelly-fish, Star-fish, and Sea-urchins (1883). Meantime he had been also devoting his attention to broader problems of biology. In 1881 he published Animal Intelligence, and in 1883 Mental Evolution in Animals, in which he traced the parallel development of intelligence in the animal world and in man. He followed up this line of argument in 1888 with Mental Evolution in Man, in which he maintained the essential similarity of the reasoning processes in the higher animals and man, the highest of all.

In 1892 he brought out an Examination of Weismannism, in which he upheld the theory of the heredity of acquired characters. In 1890 he left London and settled at Oxford, where he founded a lecture similar to the "Jade" of Cambridge, to be delivered annually on a scientific or literary topic. In 1893 he published the first part of Darwin and after Darwin, a work dealing with the development of the theory of organic evolution, and based on lectures, which he delivered as Fullerian professor of physiology at the Royal Institution in 1888—91; a second part appeared in 1895 after his death, which occurred at Oxford on the 23rd of May 1894.

Romanes was awarded the Burney prize at Cambridge in 1873 for an essay on "Christian Prayer and General Laws." Five years later, under the pseudonym "Physicus," he issued A Candid Examination of Theism, in which he showed himself out of accord with orthodox religious beliefs. In 1882 he published an article on the "Fallacy of Materialism," and in his Rede lecture of 1885 he appeared as a monotist. Subsequently his views again changed in the direction of orthodoxy, as is shown by his Thoughts on Religion, written shortly before his death and published in 1895.

His Life and Letters, by his widow, appeared in 1896.

ROMANIN, SAMUEL (1868—1961), Venetian historian, was born of a poor Jewish family at Trieste. Being left an orphan at an early age, he provided for his younger brothers and sister by giving French and German lessons. In 1821 he settled in Venice, where he afterwards translated Hamilton-Furtat's Geschichte des osmanischen Reiches into Italian. He next published his own Storia dei Popoli Europei (Venice, 1843—44). He taught in a private school and was sworn interpreter in German to the courts of justice; on the expulsion of the Austrians in 1848 he was appointed professor of history by the provisional government, and he lectured on Venetian history at the Ateneo Veneto. In 1852 he began to publish his monumental Storia documentata di Venezia, but although he finished the work, carrying it down to the fall of the republic in 1798, he did not live to see the publication completed, as he died of apoplexy on the 4th of September 1861; among his papers were found all the documents which were to be added,
and the index. The tenth and last volume was issued in
1861.

After Romanin's death his lectures on Venetian history were
published in two volumes (Florence, 1875). Among his minor
works we may mention: Gli Inquisitori di Stato di Venezia
(Venice, 1882), Bajamonti Tiepolo e le sue ultime vicende (Venice,
1851), and Venezia nel 1789 (Venice, 1860).

**ROMAN LAW**

The term "Roman law" is indefinite and
ambiguous, being used in more than one sense. First, in a
wide sense, it comprehends the total laws of the Roman
state, which were subject to the Roman legal system. In a
second and stricter meaning it indicates the law as consolidated by
Justinian or in other words, the law contained in the Corpus Juris
Civilis, which is the name that has been given since the 16th
century to Justinian's legal works as a whole, and distinguishes
them from the Corpus Juris Canonici. In this acceptance it is
equivalent to, and is often called, "civil law" as contrasted
with canon law. In a third and loose sense Roman law
embraces, in addition to the Corpus Juris, the interpretations of
it by Justinian by medieval and modern courts, jurists and
commentators adapting it to the customs and laws of their
own countries and times. The German expression, for example,
modernes (or heutiges) römisches Recht, indicates the Roman
law as it is applied in Germany in modern times. Some
medieval and modern interpretation, however, is also
sometimes expressed, in English usage at least, by the term "civil
law" as contrasted with native or common law; writers in
this field being usually styled civilians rather than Romans.
It is to the Roman law in the first of the above-mentioned three
significations that the present article is devoted.

To give a proper sketch of Roman law it must be treated
historically. Nearly all systems of positive law are the product
more or less of an historic development, but the Roman
law has this great advantage over other systems, that it
was at all times a homogeneous body complete in itself.
For the Romans were comparatively little indebted to
other peoples for their jurisprudence, and, when they
did borrow legal ideas and institutions from others, they
generally transformed or modified these in adapting them to
their own native system, so that they became substantially
Roman. Moreover, the various stages of progress of the law
from its genesis to its maturity and ultimate consolidation can
be traced in unbroken continuity. Beginning in 753 B.C.,
the traditionally accepted date of the foundation of Rome, it
continued its course till the death of Justinian in A.D. 565.
Allowing for the first three centuries being without historic evidence,
we have at least an authenticated evolution of about 1000 years.
Of no other system of law, ancient or modern, can anything
like the same thing be said.

As to the proper method of historic treatment there have
different opinions. Without going into these, it is enough
to say that the subject may be treated from two sides, viz.
on the one side in relation to the external sources of the law,
including therein the political and social conditions and the
various constitutional changes at different periods affecting
the development of the law, as well as the modes in which the
law manifested itself and the legal literature from which our
knowledge of it is derived; on the other side it may be treated
in relation to the several departments or institutions of the law
in view of their development or changes through time or
circumstance, such as marriage, slavery, property, and so forth.
This corresponds to what Leibnitz described as *external* and *internal*
history respectively, terms which are now rather out of vogue.
Of course it is possible to treat the historic sources of the law,
constitutional and literary, independently of the doctrines,
and this is now often done; but unless both are discussed the field
of Roman law is not covered. Both the external and the

internal history, however, may be treated together or in a
measure interwoven, and it is in this way that the subject
is treated in the following pages. But constitutional events
affecting the law are only noticed very summarily, details
about these being given in separate articles.

Modern writers on the history of the Roman law have
as a rule, for the purpose of systematic treatment, divided
the subject into definite historic periods. Gibbon, in the
44th chapter of his *Decline and Fall of the Roman Empire*,
seems to have been the first to suggest this mode
treatment, though the particular periods of
division he selected (being based on an artificial symmetry of
about three hundred years each) are not satisfactory.\(^2\) In
the present article, the division made by Muirhead in his article in
the 9th edition of this Encyclopedia into five historic epochs has
been left unaltered. These are: (1) the regal period; (2) the *jus
civile*, representing the period from the establishment of the
Republic until the subjugation of central and southern Italy;
(3) the *jus gentium* and *jus honorarium*, representing the latter half
of the Republic; (4) the *jus naturale* and maturity of Roman
jurisprudence, representing the period of the Empire until the
beginning of the reign of Diocletian; (5) the period of codifica-
tion, i.e. from Diocletian to Justinian. Not that there is any
sharp or fundamental division between these or, indeed, between
any historic epochs. The law is a unity: it has its roots in the
past and grows with the nation itself, and, like it, decays; there
is no break in its continuity. The division is made merely
for convenient treatment of the subject.

It must be kept in view that our knowledge of Roman customs
and laws earlier than the XII. Tables and even for some time
after them cannot be based on strict historical evidence; it is
almost entirely traditional and conjectural, and different writers
will take different views according to the relative value they
place upon this or that piece of presumptive evidence.

It is only the private law that is dealt with in the present
article.

1. The Regal Period

1. The People and the Law.

The Beginnings of the State.—The early Romans were not
different from other Indo-European communities in their
essential characteristics. The tribe, the clan, the family, the
individual: each of these appears in course of development
prior to the XII. Tables. Putting aside much of the traditional
accounts of Livy, Dionysius, and other ancient historians,
regarding the foundation of Rome and its early political and
social life, as mythical, modern critical historians are none the
less agreed that in the earliest period of their existence as a
settled community the Romans were subjected to the govern-
ment of a king (rex), with a council of elders (senatus) and an
assembly of burghehrs (comitia curiata).

It used to be a somewhat common opinion that the primitive
Romans were a sort of amalgam of three different races—Latin,
Sabine and Etruscan. This opinion is mainly based upon the
tradition that the state was originally formed by a union of
three tribes called Ramnes, Titites and Luceres; the Ramnes
being of the Latin race, the Titites of the Sabine and the Luceres
of the Etruscan. Attempts have even been made to find in the
Roman laws and institutions traces of the influence of each of these
races, and especially of the first two—*patric potestas* and *manus*,
for example, being attributed to the Latin or dominant race;
adoption and confirmation to the Sabine; forms and cere-
monial (such as lictors, fasces, &c.) to the Etruscan.\(^3\) But this
theory, which is based on a division of three races, apart from
the suspicion of a symbolic trichotomy (*tres tribus*) due to later
times, is based on no substantial evidence;\(^4\) many of the

\(^1\) This article represents a recast of the article contributed to
the 9th edition of the Encyclopedia by the late Professor Muir-
head. A large part of that article has been retained by the present
writer and the plan of arrangement, though altered in some respects,
has been adhered to in the main.

\(^2\) See to historic epochs Muirhead, *Hist. Intro. to the Law of

\(^3\) See Muirhead, *Historical Introduction* (2nd ed., 1899), pp. 3–5,
and authorities there cited.

\(^4\) Some writers deny the existence of the tribes altogether, but
this goes too far. See Bruns-Lenel in Holtzendorff's *Encyclo-
pädie d. Rechtswissenschaft*, i. p. 86.
institutions attributed to the Sabines and Etruscans were, as Mommsen and others have shown, common to all peoples of Greek-Italian stock, and could not be strange to the Latins. We must hold that the Romans were essentially a Latin race, though influenced by a considerable admixture with Sabine and, to a lesser degree, Etruscan races (see Rome).

Patricians, Clients and Plebeians.—But whatever their ethnographic descent, it is pretty certain that the Roman civitas was in the earliest period an organization that was patriarchal in its essence, but in which there was to be distinguished, on the one hand, a dominant class enjoying all the rights of citizenship, and, on the other, a semi-servile or quasi-vasal class excluded from such rights. The former class were called patricii or Quirites; the latter were called clientes and (later) plebeii.

Patricians.—There was part of the law of Rome that even in the Empire was known by the name of jus Quiritium, and this in the regal period was the only law. The patricians at first were the Quiritae, and prior at least to the time of Servius Tullius they alone enjoyed rights under this law. From their number the council of elders was selected; they alone could take part in the curiate comitia; they alone could contract a lawful marriage and make a testament; in a word, all the peculiar institutions of early Rome were for their benefit alone.

But these rights and prerogatives they enjoyed as members of gentes or clans, the clans being aggregations of families bearing a common name and theoretically at least tracing their descent from a common ancestor. These clans, of which there were normally three hundred altogether according to a rather doubtful tradition, were organized constitutionally in curies. Of the curies, again, there were thirty in all, there being probably ten in each of the three tribes, organized primarily for military and secondarily for political and religious purposes. Though for the federation of the curiae and gentes Rome required a common ruler and common institutions, religious, military and political, yet it was long before such federation into a state displaced entirely the separate institutions of the several gentes. Every clan had its own cult peculiar to its own members. It had its common property and its common burial-place. It probably had some common council or assembly, for we read not only of special gentile customs, but of gentile statutes and decrees. Tradition records instances of wars waged by individual gentes, indicating that the right to require military service alike from their members and dependants. Widows and orphans of deceased clansmen were under the guardianship of the gens or of some particular member of it to whom the trust was specially confided. If a clansman left no descendents, his property passed to his fellow-gentiles. Finally, its members were always entitled to rely upon its assistance, to have maintenance when indigent, to be ransomed from captivity, and to be avenged when killed or injured.

Along with the gentiles there were in Rome from the earliest period other persons known by the name of clientes (clients). Clientae. Their origin is wholly unknown. Some of them may have been the original inhabitants of Rome and their descendents, but more probably they were mostly immigrants from other communities or citizens of conquered towns whom the Romans were unable or unwilling to treat as slaves. Some may have been slaves to whom liberty de facto had been given. Following a custom familiar both to Latins and Sabines, such persons were placed under the protection of the heads of patrician families. The relationship was hereditary on both sides, and known as that of patron and client. The client

1 The derivation of the name is uncertain, and ancient writers differed about it. It probably comes either from quiris, a Sabine word for a spear, or from curia. The derivation from Cures is inadmissible. See Mommsen, Röm. Staatsrecht (1867, 1888), iii. 1, p. 5, n.

2 The derivation of clientes from cl avere indicates the relationship—one who is called on, who heartens. The theory that clientage became a dependent member of his patron's clan—not gentilicus but gentilicius. His patron had to provide him with what was necessary for his sustenance and that of his family; and, as ownership or possession of lands increased in extent, it was probably not unusual for the patron or his gens to give him during pleasure a plot of land to cultivate for himself. The patron had, moreover, to assist him in his transactions with third parties, and obtain redress for him when injured. The client, on the other hand, had to maintain his patron's interests by every means in his power. But the advantage must have been chiefly on the side of the client, who, without becoming a citizen, obtained directly the protection of his patron and his clan, and indirectly that of the state. A large number of clients attached themselves to and received protection from the king as patron—"royal clients," as Cicero calls them. The plebeians (plebs, from πλῆθος, meaning crowd), as distinguished from the clients, must be regarded as a heterogeneous mass of non-gentile freemen. It used to be the prevailing opinion among modern writers, following the Roman historians, that the plebeians existed as a body since the very beginning of the city. They were thought to be mainly composed of immigrants and refugees who, while being allowed personal liberty, declined to submit themselves to a perpetual state of servitude. More recently a theory of modern historians, based on philological and other grounds, has obtained wide adhesion and tends to become the dominant one. Mommsen's view is that at first there were only two classes in the community, the patricians and clients, or, in other words, that the only plebeians were the clients who, as such, possessed only quasi-liberty (Halbfreiheit), and that it was not till after a century or two that the practice of voluntary clientage began to decay and the class of plebeian freemen arose. This was partly due to gentes dying out, so that the clients attached to them were left without patrons; partly to the numbers of foreigners at Rome (through transplantation of the inhabitants of conquered cities and otherwise) having become so large that they felt themselves sufficiently powerful to do without protection; and partly to other causes.

However this be, it is generally admitted that, during the latter part of the present epoch at least, plebeians existed as a body composed of individuals of mixed races not united by any gentile organizations of their own or attached to any Roman gentes. Tradition attributes to Numa the formation of gilds or societies of craftsmen, such as potters, carpenters, smiths, and the like (collegia ofepiscopus) at Rome, eight in number. This, though probably a myth as regards Numa, may be taken as slight evidence of the creation among the plebeians of associations for trade and other purposes, that to some extent compensated them for the want of gentile organization. These gilds seem to have had a common cult and a common council to arrange disputes and consolidate customs. Between the brethren (sodales) there was a bond of close alliance and interdependence, each owing duty to the other similar to what might be claimed from a guest or a kinsman.

The Regulatives of Public and Private Order.—It would be absurd to expect any definite system of law in those early times. What passed for it was a composite of fas, jus and boni mores, whose several limits and characteristics it is extremely difficult to define. This may to some extent be accounted for by the fact that much of what was originally within the domain of fas, once it had come to be enforced by secular tribunals, and thus that the sanction of human authority, was no longer distinguishable from jus; while it may be that others of its behoves, once pontifical punishments for their contravention had gone into desuetude, sank to nothing higher than precepts of boni mores.

By *fas* was understood the will of the gods, the laws given by
heaven for men on earth, much of it regulative of ceremonial,
but a by no means insignificant part embodying rules
of conduct. It appears to have had a wider range than
*jus*. It forbade that a war should be undertaken without
the prescribed fateful ceremonial, and required that faith should
be kept even with an enemy when a promise had been made
to him under sanction of an oath. It enjoined hospitality
to foreigners, because the stranger guest was presumed, equally
with his entertainer, to be an object of solicitude to a higher
power. It punished murder, for it was the taking of a god-
given life; the sale of a wife by her husband, for she had
become his partner in all things human and divine; the lifting
of a hand against a parent, for it was subversive of the first
bond of society and religion, the reverence due by a child
to his father. There is some controversy about for they defiled
the altar; the false oath and the broken vow, for
they were an insult to the divinities invoked; the dis-
placement of a boundary or a landmark, not so much because
the act was provocative of feud, as because the march-stone
itself, as the guarantee of peaceful neighbourhood, was under
the guardianship of the gods. Some breaches of *fas* were
expiable, usually by a peace-offering to the offended god;
others were inexpiable. When an offence was inexpiable, the
punishment was usually what is called *sacratio capitis*,
excommunication and outlawry of the offender. The precepts of
the *fas* therefore were not mere exhortations to a blameless
life, but closely approached to laws, whose violation was visited
with punishments none the less effective that they were
religious rather than civil.

The derivation of the word *jus* is disputed. The usual deri-
vation is from the Sanskrit, *jus*, to "join, bind or unite", from
which some deduce as its signification "that which
binds," "the bond of society," others "that which is
regular, orderly or fitting. Brébâl identifies it with the
*jos* or *jus* of the Vedas, and the *juses* or *jusos* of the Zend-
Avesta—words whose exact meaning is controverted, but
which he interprets as "divine will or power." If Brébâl's
definition can be adopted we obtain a very significant inter-
pretation of the words addressed by the presiding magistrate
to the assembled comitia in asking them whether they assented
to a law proposed by him,—"Velitis, jubebitis, Quirites, &c.,
"Is it your pleasure, Quirites, and do you hold it as the divine
will, that," and so on. As legislation by the comitia of the
*gentes* and *cleres* was regarded as a divine office, and their
vote might be nullified by the fathers on the ground that there
had been a defect in the *auspices*, and the will of the gods
consequently not clearly ascertained, this explanation of
Brébâl's seems not without support,—"vos populis vos deis. If it be
right, then the main difference between *fas* and *jus* was
that the will of the gods, which both embodied, was in the
one declared by inspired and in the other by merely human
agency.

This *jus* might be the result either of traditional and inveter-
ate custom (*jus moribus constitutum*) or of statute (*lex*). As
to the customs, it can well be believed that at the outset they
were far from uniform; that not only the customs of the
three original tribes but those also of the different *gentes* varied,

1 Brébâl derives *fas* from the Greek *thia*. It signifies the divinely

2 See M. Schmidt in Mommsen's, *Staatsrecht*, iii. 310 n.

3 For the distinction between *jus* and *lex*, see Mitteis, Römisches
Recht, i. 377, et passim. See also some collateral etymology in the
etymology of the word *lex*. See Brébâl, l.c. p. 610; Schmidt in
Mommsen's, *Staatsrecht*, i. 310 n. While *lex* is often used like *jus*
to express law generally, it early acquired two distinct meanings,
(1) an obligation of any kind expressly incorporated in a
private deed (*lex prætoria*), as in the phrases *lex mancipi* et *lex
contractus*, &c.; (2) a ceremonial enactment, hence occasionally
called *lex publica* (Gulis, i. 3 and ii. 104). But by the jurists of
the period, the latter meaning was extended so as to cover
all laws resulting from the will of the people, including, for
example, plebiscites and even senatorial or proconsular ordinances
(*leges dative*).

and that they only gradually approximated, and in course of
time consolidated into a general *jus Quiritium*. Of
legislation there was, so far as is known, practically nothing

What went by the name of *boni mores* (as distinct from
*jus moribus constitutum*) must also be regarded as one of the
regulatives of public and private order. Part of what
fell within their sphere might also be expressly
regulated by *jas* or *jus*; but there was much that
was only gradually brought within the domain of these last,
and even down to the end of the Republic not a little that
remained solely under the guardianship of the family tribunal
or the censor's *regimen morum*. The functions of those who
took charge of *boni mores* were twofold: sometimes they
restrained by publicly condemning—though they could not
prevent—acts that were incivil as well as unnecessary exercise of legal right,
as, for example, that of the head of the house over his depend-
ants, and sometimes they supplied deficiencies in the law by
requiring observance of duties that could not be enforced by
any legal process. Dutiful service, respect and obedience
from inferiors to superiors, chastity, and fidelity to engagements,
express or implied (*fides*), were among the *officia* that
were thus inculcated, and whose neglect or contravention not only
affected the reputation, but often entailed punishments and
disabilities, social, political or religious. It was the duty of
those in authority to enforce their observance by such
*animadversio* as they thought proper—*paterfamilias* in
his family, the *gens* among its members, the king in relation
to the citizens generally; and many a wrong was prevented
not by fear of having to make reparation to the party injured
but by the dread of the penalties that would follow conduct
unbecoming an upright citizen.

That the bulk of the law during the regal period was
custumary is universally admitted, and that no laws
were committed to writing prior to the XII. Tables is
generally believed. Yet the jurist Pompeius, a
contemporary of Hadrian, speaks of certain laws
enacted by the comitia of the curies, which he calls *leges regiae*
and which, he says, were collected by one Sextus Papirius,
a prominent citizen in the reign of Tarquinius Superbus, under
the name of *Jus Papirianum*. We are also told by Paul
that this work was commented on by certain Granii Flaccus,
who was, it is supposed, of the time of Julius Caesar or Augustus.
No remains of this *Jus Papirianum* are extant, but we have a
considerable number of so-called *leges regiae* cited by Livy,
Dionysius and others, which contain rules of the private
law relating almost entirely to matters of *fas* and which appear
to have been enacted under the kings. We are also told by
Servius, the commentator on Virgil, that there was a work
known to Virgil called *De Ritu Sacrorum*, in which *leges regiae*
were collected. The authenticity of these laws, however,
is disputed, and the question is one of difficulty. Some modern
writers of high authority (e.g. Mommsen hold that the *Jus
Papirianum* is an apocryphal compilation made from pontif-
ical records about the close of the Republic. It has even
been attributed (the suggestion was first made apparently
by Gibbon) to Granius Flaccus himself. Nevertheless, the internal
evidence from the character and language of the laws them-
selves (apart from the weight that must be given to the testimony
of Pompeiunus, Servius and other ancient writers) is favourable
to their great antiquity, and it is best to accept the view that
the *leges regiae* are authentic remains of laws of the regal
period. This does not, however, involve the belief that they
were collected by Papirius, nor that they were enactments
of the comitia curiata, as Pompeius says. They seem rather
to have been regulations made by the king at his own hand.

Dig. i. 2, 2 § 2 and § 36. In the latter passage Papirius is given the
praenomen *Publius*.

Dig. l. 16, 144.

Serv. on the *Leyb. Lex. 12, 356, cited in Brunis, Fontes, p. 3.

It has been suggested that a work of the jurist Manilius men-
tioned by Pompeius (Dig. i. 2, 2 § 39) is its source (Zeitschrift d.
Staatsw. xxiv. 420).
or perhaps old-established customs formulated by the higher pontiffs and ascribed to the kings. It is also stated by Dionysius that under Servius Tullius various laws, fifty in number, dealing with contracts and delicts, were enacted in the comitia of the curiae. But we have no corroboration of this, and recent writers are now generally agreed in regarding the statement as a legend.

ii. Reforms of Servius Tullius.

It is generally agreed that towards the end of the regal period, and connected with the king traditionally called Servius Tullius, a great reform of the constitution took place, which exercised much influence on the subsequent development of the law. No doubt there is a good deal of myth attached to the name of Servius, who seems to have been regarded by later Romans as a popular monarch, like Alfred the English, but the main features of the traditional account of the constitutional reforms of this period may be taken as based on fair presumptive evidence. That all of them indeed were evolved from one brain is hardly credible, and that some of them were in observance de facto before being made constitutionally binding is altogether likely.

The design attributed to Servius was that of altering the old constitution in order to promote an advance towards equality between patricians and plebeians. He is credited with having desired, on the one hand, to ameliorate the position of the plebs and, on the other, to make them bear a proportionate share of the burdens of the state—in particular, to serve in the army and contribute to the war tax (tributum). He effected this by giving them qualified rights of citizenship, not indeed by admitting them into the gentle organizations, but by creating a new political assembly of a distinctly military character in which they as well as the gentiles could take part. The so-called Servian reforms may be roughly summarized under the following four heads, viz. (1) a division of the Roman territory within the city walls into four local wards called tribus (to which a number of tribes outside the city—tribus rusticae—were afterwards in course of time added); (2) the establishment of a register of the citizens (census) which was to contain, in addition to a record of the strength of their families, a statement of the value of their lands, with the slaves and cattle employed in their cultivation, and which was to be revised periodically; (3) a division of the people, as appearing in the census, into five classes for military purposes, determined by the value of their holdings in land and its appurtenances, with a subdivision of each class into so-called centuriae; (4) the creation of a new assembly with legislative power called comitia centuriata, in which the vote was to be taken by centuriae.

While it may be an open question how far these reforms, and particularly the institution of the centuriate comitia, were actually due to Servius, or only a result of his arrangements, the whole conception of the new constitution is obviously of early date and indicative of considerable statesmanship.

The plebeians were thereby made constitutionally part of the populus Romanus; they became citizens (Quirites). They got commercium and also consummum so far that their marriages inter se were recognized as legal marriages. Rights and duties

1 See Clark, Hist. of Rom. Law (1906), i. 16-19; Kipp, Geschichte d. Quellen (1903), pp. 24-25. The most comprehensive treatise on these royal laws, which also contains references to the earlier literature, is that of Voigt, Über die Leges Regiae (Leipzig, 1876). An exhaustive collection of them, including numerous references to royal institutions by Livy, Dionysius and others, is given in Brun, Die hohe Fr. 6th ed. i. 1 seq. Another collection is in Girard, Textes, 3rd ed. pp. 3 seq.

2 Dion. iv. 10, 13.

3 The view of some recent writers that the plebeians had at all times been considered in the jus Quirinale and were admitted to the curiae comitia and even had gentle rights (see Lenel in Holtzendorff’s Encyklopädie d. Rechtswissenschaft, 6th ed. i. 90 an. 1, 2, and authorities there cited), must be decidedly rejected. Not only does it render the whole tradition about the Servian reforms untrustworthy, but the accounts of the struggles between patricians and plebeians in the early Republic are left largely without meaning.

4 Modern writers are not agreed as to whether movable res mancipi were included with lands in the valuation of property for fixing the classes.

5 Or else by cession in jure, though this may not have been before the XII. Tables, and it was in any case of very limited operation.

6 On tribal family and marriage among the Romans in prehistoric times, consult Westermann, History of Human Marriage (London, 1891); Post, Grundriss der ethnologischen Jurisprudenz (1894), i. 15-160. Familia and family are used in this section solely in the designation of persons in the sense of husband and wife, marriage or adoption to the same paterfamilias. Strictly the word familia meant the household and all belonging to it. It had also the following principal meanings: (1) a gens or branch of a gens (e.g. the Quirites in the stricter sense); (2) the whole body of agnostic kinsmen (familia communi jure); (3) the family estate or patrimonium, as in the provisions of the XII. Tables about intestate succession, e.g. alpinus proximus familiae habet; (4) the home of those slaves collectively, as in the phrase familia rustica. See Mommsen, Staats. iii. 10 n. 16 n. 22; Rivier, Précis du droit de famille romain (Paris, 1891), § 1.

7 This word manus, though in progress of time used technically to express the power (haut) of a husband over his wife in familia, was originally the generic term for all the rights exercised, not only over the things belonging but also over the persons subject to the head of the house—as seen, for example, in the words manumission and emancipation. Cf. Just. i. 5 pr. It should be observed that among uncivilized peoples there is always a very small vocabulary, and the same word often has to do duty in several senses—e.g. familia, mancipium, nexus, caput.
daughters on emancipation ceased to be of the family of the materfamilias who had emancipated them. A daughter's children could not inherit from the members of their maternal grandfather; for children born in lawful marriage followed the family of their father, while those who were illegitimate ranked from the moment of birth as patresfamilias and materfamilias.

With the early Romans, as with the Hindus and the Greeks, marriage was a religious duty a man owed alike to his ancestors and to himself. Believing that the happiness of the dead in another world depended on their proper burial and on the periodical renewal by their descendants of prayers and feasts and offerings for the repose of their souls, it was incumbent upon him above all things to perpetuate his race and his family cult. The Romans were always strictly monogamous. In taking to himself a wife, he was about to detach her from her father's house and make her a partner of his family mysteries. With the patrician at least this was to be done only with divine approval, ascertained by auspicia. His choice was limited to a woman with whom he had connubium (é Raya) or right of intermarriage. This was a matter of state arrangement; and in the regal period and afterwards the couple might reside only with members of states with which they were in alliance, and with which they were connected by the bond of common religious observances.

A patrician citizen, therefore, if his marriage was to be reckoned lawful (justae nuptiae), had to wed either a fellow-patrician or a woman who was a member of an allied community. In either case it was essential that she should be outside his sobrín circle, i.e. more remote in kinship than the sixth degree. The ceremony was a religious one, conducted by the chief pontiff and the flamen of Jupiter, in presence of ten witnesses, representatives probably of the ten curies of the bridegroom's tribe, and was known as farreum or confarreatio. Its effect was to dissociate the wife entirely from her father's house, and to make her a member of her husband's; for confarreate marriage involved in manum conventio, the passage of the wife into her husband's "hand" or power, provided he was himself paterfamilias; if he was not, then, though nominally in his hand, she was really subject like him to his family head. Any property she had of her own—which was possible only if she had been a spinster—remained with her as the matter of course; if she had none, her paterfamilias usually provided her a dowry (dos), which shared the same fate. In fact, so far as her patrimonial interests were concerned, she was in much the same position as her children; and on her husband's death she had a share with them in his inheritance as if she had been one of his daughters.

In other respects Roman law limited more strictly the power行使 of a father, or by his paterfamilias if he was himself in potestas, over the issue of such justae nuptiae. The Roman jurists boasted that it was a right enjoyed by none but Roman citizens; and it certainly was peculiar to them in this sense, that nowhere else, except perhaps among the Latin race from which they had sprung, did the paternal power attain such an extent. The father of a child, or the latter in case of the latter in case of the child's paterfamilias and the condition of utter subjection of him to his children in potestas became greatly modified in the course of centuries; but originally the children, though in public life on an equality with the house-father, in private life, and so long as the potestas lasted, were subordinated to him to such an extent as, according to the letter of the law, to be in his hands little better than his slaves. They could have nothing of their own: all they earned was his; and, though it was quite common when they grew up for him to give them peculia, "cattle of their own," to manage for their own benefit, these were only de facto theirs, but de jure his. For offences committed by them outside the family circle, for which he was not prepared to make amends, he had to surrender them to the injured party, just like slaves or animals that had done mischief. If his right to them was disputed, he used the same action for its vindication that he employed for asserting his ownership of his field or his house: if they were stolen, he proceeded against the thief by an ordinary action of theft; if for any reason he had to transfer them to a third party, it was by the same form of conveyance that he used for the transfer of things inanimate. Nor was this all; for, according to the old formula recited in that sort of adoption known as adrogation, he had over them the power of life and death, jus vitae necisque.

It might happen that a marriage was fruitless, or that a marriage was so arranged that all his sons had the dower, as if she had been his sister, and that the paterfamilias had thus to face the prospect of the extinction of his family and of his own descent to the tomb without posterity to make him blessed. To obviate so dire a misfortune, he resorted to the practice of adoption, so common in India and Greece. If it was a paterfamilias that he adopted, the process was called adrogation (adrogatio); if it was a filiusfamilias it was simply adoptio. The latter, unknown probably in the earlier regal period, was, as we first know it, a somewhat complicated conveyance of a son by his natural parent to his adopter, the purpose of course being expressed; its effect was simply to transfer the child from the one family to the other. But the former was much more serious, for it involved the extinction of one family that another might be perpetuated. It was therefore an affair of state. It had to be approved by the pontiffs, who probably had to satisfy themselves that there were relatives of the adrogate to attend to the manus of the ancestors whose cult he was renouncing; and on their favourable report it had to be sanctioned by vote of the curies, as it involved the deprivation of his house and of his proper succession to him and any possible prejudice to creditors through capitis deminutio. If it was sanctioned, it was then the adrogatus, from being himself the head of a house, sank to the position of a filiusfamilias in the house of his adopting parent; if he had had wife or children subject to him, they passed with him into his new family, and so did everything that belonged to him and that was capable of transmission from one person to another. The adopting parent acquired potestas over the adopted child exactly as if he were the issue of his body; while the latter enjoyed in his new family the same rights exactly that he would have had if he had been born in it.

The manus and the patria potestas represent the masterful aspects of the patrician's domestic establishment. Its conjugal and parental ones, however, though not so prominent in the pages of the jurists, are not to be lost sight of. The patrician family in the early history of the law was governed as much by jus as by manus. The husband was priest in the family, but wife and children alike assisted in its prayers, and took part in the sacrifice and in the giving of benediction. As the Greek called his wife the house-mistress, βουλασκον, so did the Roman speak of his as materfamilias; the house-mother. She was treated as her husband's equal. As for their children, the potestas was so tempered by the natural sense of paternal duty on the one side and filial affection on the other that in daily life it was rarely felt as a grievance; while the risk of an arbitrary exercise of the domestic jurisdiction, whether in the heat of passion or under the impulse of justifiable resentment, was

---

1 See Plutarch, Rom. 22; Marquardt, Röm. Altert. v. 7. The question whether a husband could in early law sell his wife is one on which commentators are not agreed. The better opinion is that he could not do so if the marriage was by confession. Apart from the lex regia above mentioned, it would have been inconsistent with her dignity as materfamilias. There is certainly no trace of its having been done. In marriages by componement and usuus, on the other hand, it is not improbable that it was allowed, though here also there is no evidence of it.

2 Materfamilias was used in the texts in two distinct senses—
(1) as a woman sui juris, i.e. not subject to any family head; and
(2) as a wife in manu morti. [REGAL PERIOD]
guarded against by the rule which required in grave cases the patria potestas to consult in the first place the near kinsmen of his child, maternal as well as paternal. Even the incapacity of the children of the family to acquire property of their own cannot in those times have been regarded as any serious hardship; for, though the legal title to all their acquisitions was in the housefather during his life, yet in truth they were acquired for and belonged to the family as a whole, and he was little more than a trustee to hold and administer them for the common benefit.

The patria potestas, unless the pater familias voluntarily put an end to it, lasted as long as he lived and retained his status. The marriage of a son, unlike that of a daughter passing into the hand of a husband, did not release him from it, nor did his children become subject to him so long as he himself was in patria potestas. On the contrary, his wife passed on marriage into the power of her father-in-law, and their children as they were born fell under the status that their parents had, and the latter was entitled to exercise over his daughters-in-law and grandchildren the same rights that he had over his sons and unmarried daughters. But there was this difference, that, when the pater familias died, his sons and daughters who had remained in patria potestas and his grandchildren by a predeceased son instantly became their own masters (su/i juris), whereas grandchildren by a surviving son simply passed from the patria potestas of their grandfather into that of their father.

The acquisition of domestic independence by the family head frequently involved the substitution of the guardianship of tutors (tutela) for the patria potestas that had come to an end. This was so invariably in the case of females sui juris, no matter what their age: they remained under guardianship until they had passed by marriage in manum mariti. It was only during pupillarity, however, that male required tutors, and their office came to an end when puberty was attained. It is improbable that during the regal period a testamentary appointment of tutors by a husband or parent to wife or children was known in practice. In the absence of it the office devolved upon the gens to which the deceased paterfamilias belonged.

Family Organization among the Plebeians.—If perfect identity of customs cannot be assumed to have existed amongst the patrician gentes in the regal period of Rome, far less can it be supposed to have existed amongst the heterogeneous population (Latinis, Etruscans, Greeks, &c.) of which the plebs was constituted. Nevertheless, contiguity of residence and community of interests tend inevitably to unify customs and cause dissimilarities to disappear, and the plebeians must have not only gradually brought their own customs into union inter se, but adapted them at the same time in many respects to those of the patricians. Even to those of non-Latin race mans, their parents and paterfamilias, over their children would become a desideratum. Though the plebeians seem to have been always excluded from con- ferriation, and their matrimonial unions must have been at first informal and irregular from the point of view of the Quirites, two civil modes of acquiring marital manus were available to them after they obtained citizenship, viz. coemption and usu. Some writers hold that neither of these modes was legally recognized prior to the XII. Tables. This may be so, but it is improbable. As the plebeians obtained by the Servian constitution full capacity for quiritarian ownership, it was at once open to them to adapt the modes sanctioned for acquiring property to the acquisition of marital manus. Coemption was just a simple adaptation of manipulation above referred to (see also infra, p. 546). It was, as we may infer from what we know of it at a later time, a sale of the woman to the man per as a vivarium for nominal price. The price being nil, a piece of copper (raususculum) was used to represent it, and this was handed over to the seller, who would ordinarily be the woman's paterfamilias, or, if she were sui juris, her gentle tutor. The nuncupatory words used in the ceremony have unfortunately not been preserved; necessarily, of course, they varied from those of an ordinary mancipation of property. Though called by the jurists a mode of constituent marriage, coemption, as we know it, was strictly a mode of creating manus; for, though usually contemporaneous with it, might, as Gaius informs us, follow the marriage at any distance of time, and was not dissolved by divorce, but required a separate act of remanicipation. Students of comparative law have observed that in coemption there are clear traces of earlier bride purchase, so common even nowadays among uncivilized tribes, where a real price in cattle or sheep, and not a mere nominal one, has to be paid for the bride. Usus, on the other hand, was a mode of acquisition of marital manus by possession of the woman as wife for a certain period of time—long cohabitation. Whether this was recognized by the law prior to the XII. Tables depends probably upon whether usucaption, as a mode of acquiring property, was settled by custom earlier than the Tables. Some writers, however, think it older than coemption, and as a de facto relation prolonged cohabitation as man and wife must have existed from very early times. Comparative historians with good reason trace in usus the relics of primitive bride capture. Both coemption and usu, from the time they were first recognized by the jus Quiritium, undoubtedly created patria potestas and agnatic rights.

Law of Property.—The history of the early Roman community, like many other primitive communities, is marked by the disintegration of the gentes and the growth of individual property. Yet the distribution of land amongst the early Romans is one of the puzzling Patriae problems of their history. The Servian constitution apparently classified the citizens and determined their privileges, duties and burdens according to the extent of their lands; and yet we know nothing for certain of the way in which these were acquired. All is conjectural. We have indeed a traditional account of a partition by Romulus of the little territory of his original settlement into three parts, one of which was devoted to the maintenance of the state and its institutions, civil and religious, the second (ager publicus) to the use of the citizens and profit of the state, and the third (ager privatus) subdivided among his followers. Varro and Pliny relate that to each paterfamilias among his followers he assigned a homestead (heredium) of two jugera, equal to about an acre and a quarter. These heredia were to be held by him and his heirs for ever (quaer heredem sequentur); Pliny adding that to none did the king give more. This can only be accepted as a partially correct account of what may have taken place at some early period during the kingly régime. There can be little doubt that a portion of the Roman territory, gradually augmented through new conquests, was early reserved by the state as ager publicus; that it is sufficiently attested by the complaints made for centuries by the plebeians of its monopolization by the patricians. It is also probable that heredia (i.e. plots of land within the city) may have been granted to the heads of the gentile families, many of whom would be living in pagi on their respective gentile lands outside the city. Such heredia became family property, administered as such by the paterfamilias, but inalienable by him. In this respect the position would be very similar to what existed among the ancient Germans and exists to-day in India among the Hindus. Even late in the Republic, when the idea of

1 See as to coemption, Cuq, Institutions juridiques, 2nd ed., i. p. 62.

2 One or two writers of the later Empire (e.g. Servius, in Georg. i. 31) describe coemption as a mutual purchase, the man and woman taking alternately the position of empor and using nuncupatory words as such; but this seems to be a misapprehension and not consistent with what Gaius says. See the arguments in favour of this view in Maier, H. R., Hist. Derr. 324, 415; Giraud, Manuel, 4th ed. p. 150, gives a probable explanation of the mistake of these late authors.

3 It would thus cure defects in a coemption just as usucaption did defects in manum.

4 See Giraud, Recherches sur le droit de propriété chez les Romains (Aix, 1838); Macé, Histoire de la propriété &c., chez les Romains (Paris, 1851); Hildebrand, De antiquissimâ agri Romani distributione (Jena, 1862); Cuq, Instit. jurid., 2nd ed., vol. i. pp. 72 seq.; Beaudouin, La Limitation des fonds de terre (1894), pp. 259 seq.
Individual ownership was paramount, it was still considered a disgrace for a man to alienate his hereditum. But though the existence of monogamous families seems to imply private ownership to some extent, yet, as formerly indicated, a large part of the Roman territory at, and for a good while after, the foundation of the city must have been gentle lands held by the separate clans for the use of their members. The fact that the majority of the rural tribes bore the names of well-known patrician gentes favours the conclusion that even in the later regal period a good many of the clans still held lands in their collective capacity. It was at some uncertain time before Servius that there began to be a break-up of these gentle lands and their appropriation by individual members. Under the influence of this movement lands were acquired and held by families and individuals to a large extent. A patrician's holding must have been sometimes pretty large so as to enable him to make grants (so often alluded to by ancient writers) to his clients, but we have no means of estimating the normal size. The heredias were small; even during the Republic there is some evidence (e.g. the traditional story about Cincinnatus) that seven jugera were regarded as the normal extent of a patrician's holding for his own and his family's use. On the other hand, twenty jugera are commonly supposed to have been the qualification for enrolment in the first of the Servian classes. Of course it must be kept in view that a patrician did not necessarily hold all his lands by gratuitous assignation or concession either from the state or from his gens; purchase may have been from the former by no means uncommon, and it may have been on his purchased lands that his clients were usually placed. Those dependants were also probably employed in large numbers upon those parts of the ager publicus which were occupied by the patricians and were in historic times known as possessiones. These, of course, were not the property of their occupants; it was the lands acquired by assignation or purchase that were alone, apart from the heredias, regarded as theirs ex jure Quiritium.

The traditional accounts of the early distribution of lands among the plebeians are even, if possible, more vague than those regarding the patricians. They had apparently become holders de facto of land in large numbers before the Servian reforms. But they can have attained that position only by gradual stages. While their earliest grants of land, probably from the kings, can only have been during pleasure, latterly, as they increased in number and importance, they were regarded as hereditas. That those who had means also acquired lands by purchase from the state may be taken for granted. The distinction between de facto possession and ownership was at best a very vague one at this period, and, like the holders of provincial lands in later times, the plebeians might have the benefits of ownership without ownership. The result of the Servian constitution was to convert this de facto property or permanent possession into quiritarian ownership.1

There are some writers who maintain that in the regal period, prior to the Servian reforms, though after the collective ownership of the gentes had begun to disintegrate, there was no private property in movables. This proposition can at most be accepted only in a qualified sense. If it be meant that movables generally were not then recognized as objects of quiritarian dominium which could be vindicated by any real action, it may be admitted. But otherwise the distinction between meum and tuum must have been well recognized, de facto at least. Men must have been in the habit of transferring things from one to another by simple delivery in respect of the acquirer, sale to the person of the thing, or “thorough” appropriation of things in a man's occupation would be punished by magisterial authority or by ordinary self-redress by the injured party. A sort of ownership in

1 On this question of land-holding among the early patricians and plebeians, consult Cuq, Institutions juridiques des Romains, 2d ed., vol. i. pp. 73-76; Bourcart (French translation of Muirhead's Historical Introduction), p. 580, and authorities there cited.

2 The position of the plebeians in this respect did not differ from that of the patricians.

3 Mancipation seems to have been a very ancient mode of conveyance. The use of the barter in balance or sale was known to the ancient Egyptians at least as early as 2600 B.C., as may be seen from the reliefs in the temple of Dehr-el-Bahi in Upper Egypt. The derivation of mancipium (mancipatio) from manus capere, to seize with the hand, is given by Gaius and is confirmed by the fact that at all times in its history the acquirer had to lay his hand on the thing purchased and declare it its own. So that where several things were being mancipated in a lot, this had to be done to each separately. With lands and other immovables it was different; they might be mancipated in absence, which goes without saying. To prove that mancipation must have been extended to them at a later period. The derivation of mancipatio given by Muirhead (Historical Introduction, 2d ed., pp. 59 seq.) from manus capere, i.e. to acquire power (manus), is open to the objection that it places the abstract idea of power before the concrete symbol of man.

4 See Gal. ii. § 104.

ROMAN LAW [REGAL PERIOD]
his patrimony went to his gens. The notion that between the descendents and the gens came an intermediate class under the name of agnates does not seem well founded; nor does the regal period; the succession of agnates as such seems to have been first legally recognized by the XII. Tables, probably to meet the case of the plebeians, who, having no gentes, were without legal heirs in default of children.4

The later jurists more than once refer to the perfect equality of the sexes in the matter of succession in the ancient laws;5 but it was rather nominal than real. A daughter who had passed into the hand of a husband during her father's lifetime of course could have no share in the latter's inheritance, for she had ceased to be a member of the family. But after his death, and therefore became sui juris, did become his heir, unless he had prevented such a result by testamentary arrangements; but even then it was in the hands of the gens to prevent risk of prejudice to themselves. For she could not marry, and so carry her fortune into another family, without their consent as her guardians; neither could she without their consent alienate any of the more valuable items of it; nor, even with their consent, could she make a testament disposing of it in prospect of death. Her inheritance, therefore, was hers in name only; in reality it was in the hands of her guardians.

Of primogeniture or legal preference of one member of the family over the others there is not the faintest trace. And yet we have seen that the Roman family comprised many persons—a state of matters that would have been impossible had every death of a paterfamilias necessarily involved a splitting up of the family estate. It is conceivable that this was sometimes prevented by the practice of the gens so far as the wife and children of the deceased were concerned; and the practice of every now and then drafting the younger members of families to colonies diminished the number of those who had a claim to participate. But the simplest plan of avoiding the difficulty was for the paterfamilias to regulate his succession by testament; and this was probably had recourse to, not so much for instituting a stranger heir when a man had no issue—according to patrician notions his duty then was to perpetuate his family by adopting a new heir for partitioning the succession when he had more children than one.

There were two sorts of tests made use of by the patricians of the regal period—that made in the comitia of the cursus (test. calatis comitis) and that made in the presence of the army (probably represented for this purpose by a few comrades) (test. in procinctu factum). The first at least—and the second was just a substitute for it on an emergency—was far from being an independent exercise of the testator's voluntas. For, though in course of time, and under the sanction of the uilit legatus ita jus esto of the XII. Tables, the cursus may have become merely the recipients of the oral declaration by the testator of his last will, in order that he might testify to it after his death, it is impossible not to see in the comitais testament what must originally have been a legislative act, whereby the testator's peers, for reasons which they and the presiding pontiffs thought sufficient, sanctioned, in the particular case a departure from the ordinary rules of succession. The pontiffs were there to protect the interests of religion, and the curies to protect those of the testator's gens; and it is hardly conceivable that a testament could have been sanctioned by them which so far set at nought old traditions as to deprive a filiusfamilias of his birthright, at least in favour of a stranger.

It is quite true, however, that from the first the order of succession was agnatic; for it was those only of a man's children who could inherit any claim to his inheritance and the gens was, theoretically at least, just a body of agnates. The supposed mention of agnates in a law attributed to Numa is a conjecture of P. H. Eusche's (in Analecta Iteraria, Leipzig, 1826, p. 378). The text is MS. 173, in the Codex Fuldensis, V. 43, which a man could be effectually discharged only by payment (latterly fictitious) by copper and scales in the presence of a librigen and the usual five witnesses. In the words addressed to the creditor by the debtor in the other case (edem faucem precibus concedo: 5 I eggte ou to you this the first and the last pound”). The idea is manifestly archaic, and the words, taken strictly, are quite inappropriate to the transaction in the form it had assumed long before the time of Gaius.

1 Gal. ii. 15; Ulpian, Prae. XIX. 1.

2 Gal. ii. 15; Ulpian, Prae. XIX. 1.

3 The conjecture is supported by the words of style in the solutio per patre, as in the younger Cato, De Leg. XII, 8; Sen. de Rep. 73; Sallust, Bell. 43, which a man could be effectually discharged only by payment (latterly fictitious) by copper and scales in the presence of a librigen and the usual five witnesses. In the words addressed to the creditor by the debtor in the other case (edem faucem precibus concedo: “I give you to you this the first and the last pound”). The idea is manifestly archaic, and the words, taken strictly, are quite inappropriate to the transaction in the form it had assumed long before the time of Gaius.

4 Gai. ii. 104. By the time of the XII. Tables the sharp distinction between these two terms is tending to disappear.

5 The Voconian law of 160 B.C. avowedly introduced something new in prohibiting a man of fortune from instituting a woman, even if she was his daughter, as his testamentary heir: but even then it did not touch the law of intestacy. See Girard, Monnal, 4th ed. p. 816.

Law of Succession.—The legal order of succession during the regal period was extremely simple. It was this. On the death of a paterfamilias his patrimony devolved upon those of his descendents in postestate by that event became sui juris, his widow (being loco filiae) taking an equal share with them, and no distinction being made between movables and immovables. Such persons were styled selfs (sui heredes). Failing widow, and children, the conjecture is supported by the words of style in the solutio per patre, as in the younger Cato, De Leg. XII, 8; Sen. de Rep. 73; Sallust, Bell. 43, which a man could be effectually discharged only by payment (latterly fictitious) by copper and scales in the presence of a librigen and the usual five witnesses. In the words addressed to the creditor by the debtor in the other case (edem faucem precibus concedo: “I give you to you this the first and the last pound”). The idea is manifestly archaic, and the words, taken strictly, are quite inappropriate to the transaction in the form it had assumed long before the time of Gaius.

1 The conjecture is supported by the words of style in the solutio per patre, as in the younger Cato, De Leg. XII, 8; Sen. de Rep. 73; Sallust, Bell. 43, which a man could be effectually discharged only by payment (latterly fictitious) by copper and scales in the presence of a librigen and the usual five witnesses. In the words addressed to the creditor by the debtor in the other case (edem faucem precibus concedo: “I give you to you this the first and the last pound”). The idea is manifestly archaic, and the words, taken strictly, are quite inappropriate to the transaction in the form it had assumed long before the time of Gaius.
It may safely be assumed that by custom at all events the children of a plebeian usually took his estate on his death intestate. But, as he was not a member of a gens, there was no provision for the devolution of his succession on failure of children. The want of them he could not supply by adoption, as he had for long, it is thought, no access to the assembly of the curies; and it is doubtful if adoption of a filiusfamilias was known before the XII. Tables. If therefore, as seems probable, the XII. Tables first introduced the succession of agnates, a plebeian unprovided by children was necessarily heirless, that is to say, heirless in law. But custom seems to have looked without disfavour on the appropriation of his heredium by an outsider; a brother or other near kinsman would naturally have the earliest opportunity, and, if he maintained his possession of it in the character of heir for a reasonable period, fixed by the XII. Tables at a year, the law dealt with him as heir, and in course of time the ponthiffs imposed upon him the duty of maintaining the family sacra. This was probably the origin, and a very innocent and laudable one, of the usucapi pro herede, which Galus condemns as an infamous institution, and which undoubtedly lost some of its raison d'être once the right of succession of agnates had been established.

There is no trace of testamentary succession among the plebs prior to the Servian constitution, nor is it in the least degree likely that there was any such. Primitive communities are slow to realize the conception of private testaments, and the plebeians could not at this period make a public one either calatis comitis or in proxincta. But not long after their admission to citizenship there is reason to conjecture that mancipation was employed by them, not indeed to make a testament instituting an heir and taking effect only on the testator's death, but to make a conveyance of a whole patrimony mortis causa. The transaction took the form of an absolute acquisition, in exchange for a price (usually nominal), of the transferrer's familia, by a friend, technically called familiae empor, on trust to distribute, on the transferrer's death and according to his instructions, whatever the transferee was not authorized to retain for himself. The transferrer may also have had power to revoke it. It is true that a patrician family with a gentleman lived. Like so many other of the transactions of the early law, it was legally unprotected so far as the third parties were concerned whom the transferrer meant to benefit; they could only trust to the fides of the transferee. This mortis causa alienation, whatever the date of its introduction, was the forerunner of the so-called testament per aes et librum, to be afterwards described (infra, p. 543).

Contract and its breach.—To speak of a law of obligations in connexion with the regal period, in the sense in which the words were understood in the later jurisprudence, would be a misapplication of language. It would be going too far to say, however, as is sometimes done, that before the time of Servius Tullius Rome had no conception of contract; for men must have bought and sold, or at least bartered, from earliest times—must have rented houses, hired labour, made loans, carried goods and been parties to a variety of other transactions inevitable amongst a people engaged to any extent in pastoral, agricultural or trading pursuits. It is true that a patrician family with a gentleman establishment of clients and slaves had within itself ample machinery for supplying its ordinary wants, and was thus to a great extent independent of outside aid. But there were not many such families. There must therefore have been contracts, and some customary rules to regulate them, though these were presumably very imperfect. In many cases, such as those alluded to, of the parties at least must have trusted to the personal bond of obligation.

1 The familia, as the collective name for a man's land and mancippable appurtenances, became itself capable of mancipation. The conveyance was universal. There would be, it is thought, nothing discreditable in a man's conveying his hereditum in this form.

ROMAN LAW

REGAL PERIOD

atonement and public or private penalty. These may be have followed in sequence but overlapped each other. The first of these, which is observable in the history of the laws of other nations, the later system gradually gaining ground upon the earlier and eventually superseding it. The remarkable thing in Rome is that private vengeance should so long not only have left its traces but continued to be an active power. According to tradition it was an admitted right of the gens or kinsmen of a murdered man in the days of Numa; a law of his is said to have provided that, where a homicide was due to misadventure, the offering to them of a ram should stay their hands (supra, p. 533). And this seems to have been also prescribed in the XII. Tables (VIII., 24). To avenge the death of a kinsman was more than a right; it was a religious duty, for his mans had to be appeased; and so strongly was this idea entertained that, even long after the state had interfered and made murder a matter of public prosecution, a kinsman was so imperatively bound to set it in motion that if he failed he was not permitted to take anything of the inheritance of the deceased. The talon we read of in the XII. Tables is also redolent of the vindicatio private, although practiced in it in a more shadowy form. Of the means of reparation. And even the n axial creditor's imprisonment of his defaulting debtor (infra, p. 551), which was not abolished until the 5th century of the city, may not unfittingly, in view of the cruelties that too often attended it, be said to have savoured more of private vengeance than either punishment or procedure in reparation.

EXPECTIO, SUPPLICIUM, SACRATIO CAPITIS, all suggest offences against the gods rather than against either an individual or the state. But it is difficult to draw the line between different classes of offences, and predication is usually very arbitrary. It was the third that it was but civil injury. They ran into each other in a way that is somewhat perplexing. Apparently the majority of these specially mentioned in the so-called leges regiae and other records of the pre-Augustan period were defined as violations of divine law, and their punishments appropriate to them determined upon that footing. Yet in many of them the prosecution was left to the state or to private individuals. It is not clear, indeed, that there was any machinery for public prosecution except in treason and murder; the death of a censured deity had especially offended (nec fas est eum immolati), yet he was so utterly beyond the pale of the law and its protection that any one might kill him with impunity. But, as the sacro was usually coupled with forfeit of the offender’s estate or part of it to religious uses, it is probable that such a step to have the outlawry or communication judicially declared, though whether by the pontiffs, the king or the curiae does not appear; such a declaration would, besides, relieve the private averter of the incensed god of the chance of future question as to wrong or not the citizen he had slain was sacer in the eye of the law.

That there must have been other wrongful acts that were regarded in early Rome as deserving of punishment or penalty of some sort, besides the crimes of sacrilege and deification, is very evident. The relation of Servius Tullius, the manner of dealing with them rested on custom, and was in the main self-redress, restrained by the intervention of the king when it appeared to him that the injured party was going beyond the bounds of fair reproval, and frequently bought off with a composition. When the offence was strictly within the family or the gens, it was for those who exercised jurisdiction over those bodies to judge of the wrong and prescribe and enforce the penalty.

Early course of justice.

Tribunals—Of the course of justice, whether in criminal or civil matters, during the regal period we know little that can be relied on. Ancient writers speak of the king as having been generally supreme in both. But this cannot be said only with a good measure of reservation. For the paterfamilias, aided by a council in cases of important this jurisdiction was within the family—his jurisdiction sometimes excluding that of the state, at other times concurring with it, and not to be stayed even by an acquisitual pronouncement by it. He alone was competent in any case of crime or offence against the domestic order—adultery or unchastity of wife or daughter, undutiful behaviour of children or clients, or the like. Death, slavery, banishment, expulsion from the family, imprisonment, or other means of enquiring into and deciding his own case, or his command as punishment (pontifical approbation and not condemning self-redress so long as it was kept within the limits set by usage and custom.

The boundary between civil and criminal jurisdiction, if it existed at all, was extremely indistinct. Theft and robbery, for example, if one may conclude from the position they held in the later jurisprudence, were regarded not as public but as private wrongs; and yet when a thief was caught in the act of theft by night he might be freed and be provided with a new master or sold as a slave. But in both cases it may also be assumed that a practice, afterwards formally sanctioned by the XII. Tables—that of the chief compounding for his life or freedom—was early admitted, and the king had the right to transfer such a man and his few goods, if not yet his person, to another sold as a slave. But that self-redress was not stayed if the reparation found due was withheld; as the party wronged was still entitled to the reparation due by the other party. Whenever the matter of option in time came to be regarded as a right; and with it there would be occasional difficulty in settling the amount of the composition, and consequent necessity of an appeal to a third party. Here seems to be the origin of the king's jurisdiction in matters of this sort. He was no king, as we understand the term, to whom The king as judge, could refer such a dispute; for he alone, as supreme magistratate, had the power to use coercion to prevent the party wronged insisting on his right of self-redress, in face of a tender by the other party. Such a practice would have been absolutely impossible, though between clansmen they may have been settled by the gens or its chief. The words of style used in the sacralmental real action (infra, p. 548) suggest that there must have been at least in time when the spear was the arbiter, and when the contending parties, backed possibly by their clansmen, friends, actual combatants, and victory decided the right. Such a procedure could not long survive the institution of a state. In Rome there seems to have been very early substituted for it what from the nature of the case could not well be avoided—settling of controversies between the parties to make oath to the verity of his contention; and the point in that in form they decided was which of the two oaths was false and therefore to be made atonement for. In substance, however, it was probably a composition issue; and the party in whose favour it was pronounced was free to make it effectual if necessary by self-redress in the ordinary way.

Of Servius, Dionysius says—using, as he often does, language more appropriate to the republican than to the regal period—that he drew a line between judicial and non-judicial processes, and that, while he retained the former in his own hands, he referred the latter to private judges, and regulated the procedure to be followed in causes brought before them. Something of the sort was absolutely necessary. He was enormously increasing the number of the citizens,—that is to say, of

2 Dion. Hal. iv. 25.
those who were to enjoy in future the privileges of quiritan right, and multiplying the sources of future disputes that would have to be determined by the tribunals. The nature of the jurisdiction created by him, if any, to meet the new aspect of things was not controverted. He has been, indeed, credited in the college courts of the Centumviri and the Decemviri (stitibus judicandis) as well as the private judge (unu juxtus), but the arguments in support of this view are not strong, and, of course, based on presumptions. However, it will be convenient to say a few words about each of these courts.

The centumviral court is often referred to by Cicero, and the range of its jurisdiction in his time seems to have included every possible question of manus in the old sense of the property of individuals, property and its encumbrants, and inheritance whether testamentary or intestate. By the time of Gaius the only matters apparently that were in practice brought before it were questions of inheritance by the juros civiles (judges), though there was still a list of all acts connected with these, and the name, the emblem of quiritan right generally, was still in use. During the later Republic the Centumviri formed a quasi-corporate body of private judges selected originally from the tribes (whoever were the centuriae), but having the right somehow to try cases down to the 6th century of the city; while the weight of recent authority is in favour of the view that it is not earlier than the beginning of the 7th century. The arguments in support of these several views cannot be advanced here, but are found in the works of the 2d and 3d centuries B.C.; and we have little to add to that positive proof of its existence earlier than the 7th century, though presumptions are in favour of its having been somewhat earlier. In the exercise of their office the Centumviri acted more independently than the praetors, and were venturers, do, and even introduced some considerable reforms into the law.

There was a court at Rome during the Republic called the Decemviri stitibus judicandis. These decemvirs in historic times constituted the legislative and judicial organs of the Roman state. They were elected by the comitia centuriata, to the office of decemvirs, and their duty it was to try certain kinds of actions, especially those relating to personal liberty. During the Principate, while ceasing to act as a separate court, they presided over the division to which the centumviral court had been under Augustus divided. Their origin is quite unknown. Pomponius indeed says that they were originally created soon after the institution of the peregrine praetorship in 242 B.C. for this very purpose of presiding over centumviral courts, but this statement is generally accepted, if true, as a kind of final practice, in that the presiding must quickly have gone into disuse. Those writers who attempt to trace back the centumviri to the regal period give, as a rule, a like antiquity to the Decemviri stitibus judicandis. On the other hand, authorities, identifying these decemvirs with the decemviri of Julius Caesar, mention by Livy as having been declared by the lex Valeria Horatia to be as sacrosanct as the tribunes of the plebs. But these latter judges seem to have been a pure plebeian court which later went into desuetude, and there is really no evidence of identity.

So far back as historic evidence goes we find that actions were tried and judgments pronounced by judges and arbitri. There were also there, as it were, an uma justiciarius and a person appointed to try a case, but there might be more than one arbiter, and frequently were three. All kinds of actions, even a sacramental action in rem, could be brought before the judges, but especially appropriate to them were personal claims of alleged indebtedness, whether arising out of a legal or illegal act, denied either in toto or only as to the amount. Matters of that sort involved as a rule a general principle of law and a set of legal facts, which could well be decided by a single individual. There is much more reason for crediting Servius with the institution of the single judge (the arbitrators may have been a creation of the X11. Tables) than with either of the collegiate courts, but it is believed that in the early regal period the king, along with the pontiffs kept all jurisdiction in his own hands, it is plain that this must have become a practical impossibility after the admission of the plebeians to citizenship. For the trial of disputed facts it would be necessary to delegate jurisdiction, and the earliest judges may have been the king's commissioners for such cases. If this be right, it was the beginning of a system that bore wondrous fruit in after years, and that, as will be shown in the sequel, helped the praetors to build up, through the formule, the whole body of civil law.

Under the kings it is not improbable that several of the legal actions, more or less undeveloped, were already in use, but the nature of these actions will be more conveniently considered later on. (infra, p. 566)

II. The Jus Civile

(From the establishment of the Republic until the subjugation of central and southern Italy.)

1. Constitutional Events affecting the Law.

Jus Civile contrasted with Jus Quiritium.—The term jus civile, as used to designate this chapter, though almost synonymous with, may be taken as somewhat more comprehensive than, jus Quiritium. It is a term of later origin than the latter. Jus Quiritium was, based entirely on old custom and legislation, finding, one may say, its culmination in the XII. Tables; whereas in the jus civile, as here understood, there appears the element of doctrinal interpretation of both statute and custom— the magistrates and jurists (particularly the pontiffs) adding much to the earlier law by introducing into it this element. We can say that the jus civile in this sense is jus Quiritium as developed by interpretation. It is as yet, however, little influenced, as was the more comprehensive jus civile of later periods, by the elements of jus gentium and equity. Still nowhere, we must note, are the terms jus Quiritium and jus civile placed in contrast by the jurists; they were each jus proprium civium Romanorum. In the classical law the term jus Quiritium seems to be used principally in formulæ framed in accordance with the X11. Table customs.

Though our information regarding the present period is less legendary than that of the kings, it is still far from being completely authentic, as no original documents belonging to it are extant. There is little dispute among critics that Rome was sacked and burned by the Gauls about 387 B.C. or a few years later, and it is probable that the original pontifical annals (annales maximi) upon which Livy and other Roman historians have presumably based their narratives of early history were destroyed at that time along with all other written records. What credence, then, we may give to the ancient historical narratives, for the period of the Republic antecedent to this event, depends largely upon how far the pontifices managed to have their lost records restored. In any case, however, there is sufficient presumptive evidence to warrant belief in such prominent events of the early Republic as the creation of two annually elected patrician consuls, with potestas similar to that of the king; the creation of tribunes of the plebs, the enactment of the decemviral code, and periodic struggles between patricians and plebs, the one to keep and the other to gain political power. To know the exact dates of these events is relatively little important.

Legislation in Favour of the Plebs.—In their uphill battle for social and political equality the plebeians conquered stage by stage. The more important of their successes may here just be mentioned, with all reserve as to credibility, in the order of their traditional dates. By the lex Valeria (de provocatione) of 700 B.C. it was provided that no Roman citizen should be deprived of life, liberty or citizenship (i.e. suffer poena captivitatis), or be scourged, by any magistrate within the city, without an appeal (provocatio) to the comitia centuriae. This statute was often referred to by later Romans as a sort of Magna Carta; Livy calls it unicum praesidium libertatis. In 494 or 471 B.C. the tribunes of the plebs were created with right of intercession, and about the same time plebian acts and judices decemviri (the latter to act as judges or arbiters in litigation); the persons of all these officials being declared inviolable during their tenure of office. About 471 B.C. the concilium plebis became legislatively recognized, the tribunes

were elected in it, and its resolutions (plebiscia) became directly binding on plebeians. The XII. Tables, twenty years later, were the fruit of the agitation of the plebeians for a revision and an efficient embodiment of the law. In 449 plebsbicita were—subject presumably to auctiorias patrum—declared by the lex Valeria-Horatia binding on the whole populus, while about the same time, or perhaps a little earlier, the patrician-plebeian comitia of the tribes was instituted. By the lex Conulum of 445 B.C. intermarriage between patricians and plebeians was sanctioned. Repeated protests by the plebeians against the monopolization of the public domain by members of the higher order resulted in the definite admission of their right to participate in its occupation by one of the Licinian laws of 367 B.C. The long course of cruel oppression of insolvents (mainly plebeians) by their patrician creditors was put an end to by the Poetilian law about 326 B.C., depriving nexit contract of its privileges and generally prohibiting the use of chains and fetters on persons incarcerated for purely civil debt. By the Hortensian law of about 287 B.C. plebiscita were declared binding (presumably without auctiorias patrum) on the whole body of citizens. And from 421 B.C., when one of their number first reached the regular state magistracy as quaestor, down to 25 B.C., the plebsbicita were declared gradually vindicated their right as citizens to share in all the honours of the state. There is also evidence that plebeians were early in the Republic admitted to the Senate and also to the comitia curiata.

The legislative bodies during the present period were thus three in number: the comitia of the centuries, the concilium legislativa plebis and the comitia tributa. As to the comitia of the centuries, it seems to have hardly concerned itself with general legislation, but met merely to confer imperium on the higher magistrates and to sanction treaties and conventions of the gentiles. The legislation of the centuries dealt for the most part (though the XII. Tables were enacted by it) with questions affecting public and constitutional rather than private interests. It could be convened only by a magistrate having military imperium, i.e. at first only the consuls, for the reason that it was theoretically a military assembly met for civil purposes (exercitus civilis). It is called in the XII. Tables, 'the concilium maximus.' Its procedure was cumbrous and ill- adapted for legislation. As to the comitia tributa, the concilium plebis to the comitia tributa there is much controversy. The old opinion which identified them is now generally abandoned. According to Mommsen they differed in the following points: (1) the comitia was an assembly of the whole people voting in tribes instead of centuries, while the concilium was an assembly of the plebs alone; (2) the comitia was always convoked and presided over by a patrician magistrate (often the praetor), while the concilium had to be convoked and presided over by a plebeian official (usually a tribune); (3) in the comitia auspices had to be taken beforehand, but not in the concilium; (4) an enactment of the comitia was a lex binding on all the populus, while an enactment of the concilium was a plebscitum binding only on the plebs. It is, however, not possible to take Mommsen's view that plebscitum were not binding on the whole populus prior to the lex Hortensia, without disregarding distinct statements of Livy as to the lex Valeria-Horatia and the lex Publilia. But whatever the relation of these two legislative assemblies to each other may have been originally, it is certain that the Hortensian law equated them so far as their effects were concerned, and, looking to the small number of patricians compared with the plebs, it would probably be a matter of indifference in which assembly the vote was taken. The greater part of the legislation dealing with the private law in the later Republic consisted of plebscitum.

1 There is diversity of opinion about this. Mommsen thinks the comitia tributa was earlier than the XII. Tables, and that the lex Valeria-Horatia applied to it. See next note.

3 Livy, iii. 55. 3; viii. 12, 14.

ii. The XII. Tables.

Causes of their Enactment.—The change from monarchy to republic brought of itself no benefit to the plebs, but rather the reverse. One of their chief complaints was against the administration of justice. They complained that they were kept in ignorance of the laws, and that in particular the consuls used their magisterial punitive powers (coercitio) unfairly and with undue severity when a plebeian was the object of them. The state of matters gradually became so intolerable that in the year 462 B.C., according to the ancient tradition, a proposal for a statute was made by C. Terentius Arsa, one of the tribunes, by which a commission should be appointed to draw up a code of laws in writing. He carried a rogation in the concilium plebis to this effect. The Senate at first strenuously resisted, but after a few years was induced to give way, and its assent to the proposal was obtained.

Tradition records that the first practical step towards its realization was the despatch of a mission to Athens, to study the laws of Solon and collect any materials that might be of service in preparing the projected code. On the return of the commissioners in 452 B.C. all the magistrates were suspended, and a body of ten patricians called decemviri scribundis, was appointed with consular powers, under the presidency of Appius Claudius, for the express purpose of putting the laws into shape. Before the end of the ensuing year (451) the bulk of the code was ready and was at once passed into law by the comitia of the centuries and published on ten tables (whether of brass or wood is doubtful), which were set up in the Forum. Next year, owing to additions being found necessary, the decemvirate was renewed, with, however, a change of membership (some plebeians being chosen), and in the course of a few months it had completed the supplemental matter. On the downfall of the decemvirate, these new laws, after being duly accepted by the comitia, were published on two other tables, thus bringing the number up to twelve. The code then received the official name of Lex XII. Tabularum.

The foregoing account of the enactment of the Tables is an attempt to summarize what is stated by Livy and other Roman writers on the subject. Though inconsistent and sometimes even contradictory about details, these writers are on the main facts in concordance. Until a few years ago, the fact of the publication of such a code about the date above given had been accepted by modern historians, even the most iconoclastic, without question; unlike the leges regiae, the XII. Tables had always been regarded as authentic. But in his History of Rome, published in 1898, Professor Pais of Turin4 omitted the view that the decemviral code was really a private compilation made about the year 304 B.C. by Cn. Flavius, the scribe of Appius Claudius the censor, and probably at the latter's instigation; or, in other words, that it was just the so-called Jus Flavianum which all writers had hitherto regarded as a work dealing with the styles of legis actiones and the calendar of court days. In Pais's view the annalists, in accordance with a habit of theirs, duplicated the same event by counterfeiting an earlier Appius Claudius, &c., in order to magnify the antiquity and authority of the laws collected by Flavius, while the whole account of the decemviral legislation was invented by them. More recently Jules de Hales and Lambert of Lyons has attempted by similar arguments to prove that the XII. Tables were a private compilation of customs already in observance, and of sacerdotal and other rules already in circulation, made about 197 B.C. by the jurist Aelius Paetus, and were in fact identical with the Tripartita or Jus Aelianum, which had always heretofore been supposed to contain merely a recension of the Tables with an interpretation and commentary.5 This is not the place to discuss these theories. Though of course incapable of positive disproof, the weight

4 Pais, Storia di Roma (Turin, i. 566 seq.

5 Nouvelle Revue historique (1900), xxvi. 149 seq.; Revue générale du droit, nos. 5 et 6; Mâdèges, Appleton (1903), pp. 126 seq.
of presumptive evidence is against them; they have hitherto found little or no support from other Romanists, and they, in our opinion, have been sufficiently refuted on philological and historical grounds, and it is therefore unnecessary to wander into a discussion of the point, which, however, were native and original so far as they amounted to a general formalization of the hitherto floating customary law, for, notwithstanding Livy's eulogium of them as the "fountain of the whole law, both private and public," it seems clear that many branches of it were dealt with by different tribunals and courts, each with reference to an offical point of detail. The institutions of the family, the fundamental rules of succession, the solemnities of such formal acts as marriage, necissum, and testaments, the main features of the order of juridical procedure, and so forth, of all these a general knowledge was presumed, and the decemvirs thought it unnecessary to define them. What they had to do was to make the law equal for all, to remove every chance of arbitrary dealing by distinct specification of penalties and precise declaration of cases under which rights should be held to have arisen or been lost, and to make such amendments as were necessary to meet the complaints of the plebeians and prevent their oppression in the case of the family. The concept of the custom of the curial, according to which a man's property was his alone, was therefore, was introduced into the Tables, that was already universally recognized, and not complained of as either unequal, defective or oppressive. Only one or two of the laws ascribed to the kings (assuming their greater antiquity) reappeared under the regulation of the decemvirs. It is possible to repeal or imply denial of their validity, for a few of them continued still in force during the Empire, and are founded on by Justinian in his Digest. Neither apparently were any of the statutes of the Republic anterior to the decemvirs' time included in the Tables, and all those to which an author must have submitted to prosecution under these laws and to suffer the penalties they imposed. The original Tables are said to have been destroyed when Rome was sacked by the Gauls. But they were probably at once reproduced, and transcripts of them in more or less modernized language must have been abundant if, as Cicero says was still the case in his youth, the children were required to memorize them in order to make their examinations. This renders all the more extraordinary the fact that the remains of them are so fragmentary and their genuineness in many cases so doubtful. They were embodied, as above mentioned, in the Tres Corpora of Ulpian, and were also published by the emperor Hadrian as the Corpus Juris Civilis. Refusing to make use of the older sources, Ulpian and the emperor republished them in somewhat modernized language and from whose work, it is thought, all later writers took their contents. They must have formed the basis of all the writings on the jure civile down to the time of Peter Wulff, of whom we shall speak presently. Of the old text we have the text of Servius Tullius, which is the oldest extant; and there were the manuscripts of even by authors later than Servius, amongst them by M. Antistius Labeo in the early years of the Empire, and by Gaius, probably in the reign of Antoninus Pius. A couple of score of others can be mentioned; but the important provision is that the text of the ius civile as it occurred in the Tables, whether in a form in the most cases more modern than what we encounter in other remains of archaic Latin of the 4th century of the city. These are contained principally in the writings of Cicero, the Nactus Alloca of Aulus Gellius, and the treatise De verborum significatione of Festus; the latter dealing with them rather as matters of antiquarian curiosity than as rules of positive law. There are also many allusions to particular provisions in the pages of Valerius, Caro, Varro, Gellius and the elder Pliny, as well as those of Gaius, Paul, Ulpian and other ante-Justinian jurists; but these are not to be implicitly relied on, as we have evidence that they frequently represented the views of the jurists of their times rather than the actual provisions of the statute. Reconstruction has therefore been a work of difficulty, and the results far satisfactory, that of the latest editor, Voigt, departing very considerably from the versions generally current during the last half-century.4

1 Textes, pp. 3-4; Novus Rev. hist. xxvi, 381 seq.
3 The decemvirs may have obtained their mission either to Athens or to Etruria, as the story of Athens is improbable.
4 See K. Fass's Übersicht der bisherigen Versuche zur Kritik u. Herstellung d. Zwolf-Tafel-Fragmente (Leipzig, 1824), supplies the basis of all the later work on the Tables anterior to that of Voigt Scholl, in his Legis XII. Tab. reliquiae (Berlin, 1866), made a valuable contribution to the literature of the subject from a philological point of view. His version has been adopted substantially by Bruns in his Fontes juris, i. 16 seq. (6th ed. by Mommesen and Graberwitz), and Girard in his Textes(3rd ed., Paris, 1903). See therein the laws contained in the Tables were of remarkable brevity, terseness and pregnancy, with something of a rhymical cadence that must have greatly facilitated their retention in the memory. Rarely, if ever, were the rules they embodied so very plain of meaning, so concise and ready to commit to memory, so free of nuisances, so free of superfluous repetition, so plain and lucid in expression, that there was occasion for the usual judicial caution, "in dubio pro reo," so frequent in the Codes and later codes. The law may have been capricious and oppressive. The system ofnullum incertum est ius, which has been held in doubt, was thereupon to provide an adequate substitute. It is true that there existed an amendment of the case of a person found guilty of sacratio capitis, sacratio esto was a common sanction; but in the Tables it occurs only once pure and simple, and that with reference to an offence that could be committed only by a patrician,—the theft of a client or a slave. Only in case of a slave was the decemvirs admitted an exception, a hard-and-fast rule to any qualifications that might cause uncertainty. The system ofnullum incertum est ius, which has been held in doubt, was thereupon to provide an adequate substitute.

demanding compensation. The Tables also recognize the system of self-help. The manus injunctio of the third Table—the execution done by a creditor against his debtor—was probably in essence the same as that which in the Codes was provided for by the provision of the later decemves sanctioned by the master of the act, the law of the father of the father, or the law of the husband and wife, in some cases, to suppress by threat or force the act of a man. Against a thief taken in the act the same procedure seems to have been sanctioned; it was lawful to kill him on the spot if the theft was nocturnal, or even when it was day, if the thief was caught during the act. This was not the apprehension. According to Gellius, there was a provision in these words: "si telum manu fugit magis quam ject, artem subicit"; this is perhaps just a re-enactment in illustrative language of the law. The manus injunctio was limited to the case of debtors who, if the weapon were sped from the hand rather than been aimed at, a ram was to be rendered to the man for the purpose of a man who was all the more from the fact that he had been slain. The original purpose must have been to stay the execution of the Tables, to which misfortunes and to stay the prosecution which it was incumbent on the Kabees of a murdered man to institute. So with talionic penalties; si membrum ruptit ni cum eo pacit, talio esto—such, according to Gellius, were the words of one of the laws of the Tables, and they undoubtedly recognize talion, "an eye for an eye, a tooth for a tooth"; while at the same time regulating it by enabling the injured man to bring an action and sanctioning a money recompense (Wehr) in lieu of it.

Interpretation of the Tables.
limitation, and in many the deduction of new doctrines from the actual jus scriptum, and their development and exposition. An event that did much to diminish the influence of the pontiffs in connexion with it was the divulgation in the year 204 B.C., as already mentioned, by Ca. Flavius, of a formula of actions and a calendar of lawful and unlawful days, which got the name of Jus Flaviianum. The practice adopted in the beginning of the 6th century by Tiberius Corunicus, the first plebeian chief pontiff, of giving advice in law in public had a still greater following, later on publishing "Triperitia" or Jus Aestianum, some fifty years later—a collection that included the Tables, the "interpretatio" and the current styles of action—made it as much the heritage of the laity as of the pontifical college.

Subsequent Legislation.—Of legislation during the 4th and 5th centuries that affected the private law we have but scanty record. The best-known enactments are the Canuleian law of 445 B.C. above mentioned; the Genuci, Marcellian, and Flavian laws, and many others. "The Pontifical law of 326 B.C. abolishing imprisonment of nexal debtors by their creditors; the Silian law, probably not long afterwards, which introduced a new form of process for actions of debt; and the Aquilian law about 287 B.C., which amended the decemviral provisions for actions of damages for culpable injury to property, and continued to regulate the law on the subject even in the books of Justinian.

iii. Development of the Substantive Institutions of the Law.

The citizen and his "caput."—The early law of Rome was essentially personal, not territorial. A man enjoyed the benefit of its institutions and of its protection, not because he happened to be within Roman territory, but because he was a citizen—of those by whom and for whom its law was established. The theory of the early Romans was that a man sojourning within the bounds of a foreign state was at the mercy of the latter and its citizens, that he himself might be dealt with as a slave, and all that he had was protected by the first comer; for he was outside the pale of the law. Without some sort of alliance with Rome a stranger had no right to claim protection against maltreatment of his person or attempt to deprive him of his property; and even then, unless he belonged to a state entitled by treaty to the international judicial remedy of recapitulatio, it was by an appeal to the good offices of the supreme magistrate, or through the intervention of a citizen to whom he was allied by the (frequently hereditary) bond of hospitium, and not by means of any action of the jus civile set in motion by himself. A non-citizen—originally kōstis, and afterwards usually called peregrinus—"in time came to be regarded as entitled to all the rights recognized by so-called jus gentium as belonging to a freeman, and to take part as freely as a Roman in any transaction of the jus gentium; but that was not until Rome, through contact with other nations and the growth of trade and commerce, had found it necessary to modify her jurisprudence by the adoption of many new institutions of a more liberal and less exclusive character than those of the jus civile.

A citizen's civil personality was technically his caput. The extent of it depended on his family status. It was only among citizens that the supremacy of the paterfamilias and the subjection of those in manu, potestas or manus were recognized—only among them therefore that the position of an individual in the family was of moment. While in public life a man's supremacy or subjection in the family was immaterial, in private life it was the paterfamilias alone who enjoyed full jural capacity. Those subject to him had a more limited personality; and, so far as capacity to take part in transactions of the jus civile was concerned, it was not inherent in them but derived from their paterfamilias: they were the agents of his will, representatives of his persona in every act whereby a right was acquired by them for the family to which they belonged.

Whenever a citizen either ceased altogether to be a member of a Roman family or passed, either permanently or temporarily, into subjection to some paterfamilias outside his own "caput," there was technically caput minuto or diminutivo. To harmonize with the gradually established conception of jural personality in non-citizens, and perhaps also from their partiality for tripartite divisions, the jurists about the end of the Republic divided caput diminutivo into three degrees, viz. maxima, media, and minima—"a division unknown to lawyers of an earlier period when civilias was theoretically identified with libertas. When a citizen forfeited his freedom, his caput diminutio was said to be maxima; he lost all capacity, whether under the jus civile or the jus gentium. When, retaining freedom, he went into exile or joined a Latin colony, or otherwise became a peregrinus, the lesser diminutio (of capacity) was media or minor; it was his rights and privileges under the jus civile that alone were affected. When both freedom and citizenship remained, and there was produced merely the severance of connexion with a particular family (familiae mutatio), the loss was said to be minima. Illustrations of c. d. minima present themselves in the case of a paterfamilias becoming filiusfamilias by adoption, or a materfamilias passing into the hand of a husband by confrarreation or coemption; in both cases he or she who had been sui juris thereby became aliens juris. It was immaterial whether the change was from a higher family position to a lower, or from a lower to a higher,

An important consequence of minima capitis diminutio was that it not only extinguished patriss potestas where it existed, but severed the bond of agnation between the capite minuto and any person who had previously been related to him as agnate. There was no longer any right of succession between them on intestacy; their reciprocal prospective rights of tutorship were defeated, and the "minuto" of either tutor or ward put an end to a subsisting guardianship, assuming always that it was a tutela legitima or agnatica cura juris. Very remarkable, yet quite logical, was the doctrine that the minuto extinguished the claims of creditors of the minuto; their debtor, the person with whom they had contracted, was civilly dead, and dead without an heir, and therefore there was no one against whom an action of the jus civile could be directed in order to enforce payment. But equity eventually provided a remedy, by

1 Neither "alien" nor "foreigner" is an adequate rendering of peregrinus. For peregrini included not only citizens of other states, individual or corporate, but also aliens who could not call themselves citizens (civis) at all, as, for example, the dedicii whom Rome had vanquished and whose civic organization she had destroyed, offenders sent into banishment, &c., and also, until Caracalla's general grant of the franchise, the greater portion of her provincial subjects.

2 Children who became sui juris by their parent's death, as they came under no new potestas, were not regarded as capite minuti.

3 Owing to the ill-defined views among the Roman jurists themselves regarding the nature of cap. dem. various theories more or less divergent have been maintained about it by modern writers, of none of which can it be said that it has been generally accepted. Mommsen's theory, above adopted, seems to present fewest difficulties. See Goudy in 2nd edition of Murhead's Historical Introduction, pp. 422-27.

1 This is Mommsen's theory. See Staatsrecht, iii. 1. p. 8.
giving the creditors a praetorian action in which the minutio was held as rescinded, and which the new paterfamilias was bound to defend on pain of having to give up all the estate he had acquired through the donation or in manum conuenio. In other respects also the strict effects of this capitl minutio were attenuated or done away with by the jurists of the Empire, e.g. as regards personal servitudes.

The Law of the Family Relations.—So far as appears no serious inroad was made by the XII. Tables on the law affecting husband and wife, unless in the recognition of the legality of so-called “free” marriages, i.e. entered into without any solemnity, and not involving that subjection of the wife to the husband (manus) which was a necessary consequence of the patronage confrarion and plebeian coemption. These latter were left untouched, while on the other hand acquisition of marital manus through usus was fully recognized. As formerly mentioned, it had become a practice with some of the plebeians to tie the marriage bond rather loosely in the first instance, possibly in consequence of objection by the woman (as became quite general even among patricians at a later date) to renounce their independence and right to retain their own property. But more generally, because taking a woman to be merely the mother of children (matrimonium) had been practically forced upon them by coercion had been introduced as a means of making her a lawful wife, and so they had become in a manner habilitated to it. But the idea that, as a man might acquire the ownership of a thing to which his legal title was defective by prolonged possession of it, so he might acquire manus over the woman with whom he had thus informally united himself by prolonged cohabitation with her as his wife had probably matured and become customary law. The Tables accepted it; all that was needed was to define the conditions under which manus should be held to have been superinduced, and the wife converted from a doubtful usor into a lawful materfamilias. Hence the provision that, if a woman, married neither by consecration nor coercion, desired to retain her independence, she must each year absent herself for three consecutive nights from her husband’s house (trinocialis usurpation)—twelve months’ uninterrupted cohabitation being required to give him that power over her which would have been created instantly had the marriage been accompanied by either of the recognized solemnities.

Amongst the fragments of the Tables so indistinctly collected there is none that refers to a wife’s marriage portion (dow); but it is hardly conceivable that it was as yet unknown. Juystian says that in ancient times it was regarded as a donation to the husband with his wife, rather than as a separate estate that was to be used by him alone. When the marriage lasted but to revert to her or her representatives on its dissolution. And it is easy to see that, where there was manus, the wife becoming a member of her husband’s family and everything of hers becoming his, such must originally have been its character. But even then, when a man gave his daughter (filiusfamilias)—who could have nothing of her own—marriage, and promised her husband a portion with her, there must have been some process of law for compelling him to pay it; and the laws were subject to the objection that an ancient institution for the purpose has something in its favour. As regards divorce, Cicero alludes vaguely to a provision in the Tables about a man depriving his wife of the house-keys and turning her out of doors, with the proviso that if it is done with the concurrence of the husband it is not to be taken as divorce. This can only refer to free or non-manus marriages, but even for hand marriages, while repudiations by husbands (but not by wives) were competent, the statement of the historians is that they were few and far between until the 6th century of the city, and that, unless the husband repudiated his wife away, however serious the ground, without the cognition of the family council, was liable to penalties at the hands of the censors. Of the two or three provisions of the Tables known to us that affect divorces (cessio potestas), one itself was assimilated to be so well established by customary law as to need no statutory sanction or definition, one was in the words “si pater (familias) ter filium venum duit, a patre filius liber est.” This came to be construed by the pontifical lawyers as meaning that so powerful

1 See Cicero, Top. Ivi. 23.
2 Voigt, X. Tafeln, ii. p. 486. It has not, however, received any support from more recent writers.
3 See Esmein, Mélanges, pp. 23 seq.
4 The bond of the potestas over a son that it could not be completely leossed until the father had three times gone through the process of fictitious sale by which emancipation was effected. But the conception of the law seems to indicate that its original purpose was to deter testamentaries rather to impose a penalty on the father and confer a benefit on a son in potestas, by declaring him ipso jure free from it on a certain event, than to place difficulties in the way of his emancipation. If a house-father have thrice sold his son, the son shall be free from the penalty, as if the intention were to rescue the son from what, by its frequent repetition, was suggestive of a total absence of parental affection rather than reluctant obedience to overwhelming necessity. May not its object have been to restrain the practice, which did not wholly disappear in the Senate, of giving to children by will a large part of their creditors in security of loans—such sales or pledges, at the time of the Tables, being effected only by an actual transfer of the child per as et librum as a free bondman (in mancipi causa), and not by mere property rights, i.e. by a purchase or by a legal recognition when the loan was paid? Whatever its ratio, however, and whatever the earlier practice, it was upon this law that the interpreting pontiffs based the rules for adoptions and emancipations of filiusfamilias. The usual procedure in adoptions was as follows: The natural father mancipated his son to a friend for a nominal price and the latter then manumitted him, the son thereupon reverting into his father’s potestas. This was repeated a second time with the same result. After the third sale (patria potestas being extinguished) the purchaser remanipated to the parent. In the latter’s hands the son was now in causa mancipi, and so in a position in which he could be permanently transferred to the adoption. This was a process by which, in which the adopter averred that the child was his filiusfamilias, and which judgment was at once given in his favour on the natural parent’s admission or tacit acquiescence. A similar method was followed in emancipation of a filius, except that of course there was no census of the property, but there had to be a gratuitous transfer for the reconvenance to him. Neither in adoption nor emancipation, however, was emancipation the paterfamilias essential, though it was usual, and in the case of emancipation carried with it the rights of children and grandchildren the pontifical jurists by a casistic interpretation of the said law held one emancipation to be in all cases enough to extinguish the patria potestas. The nature of the relationship between master and slave, like that of manus and patria potestas, seems also to have been too notorious to require exposition in the Tables. We find recorded only two references to it, one dealing with the case of a slave who had a concommitant on a slave. In the latter’s case, the father of the one was the son of the other’s father in potestas (nosc exeditio). The provision about noxal surrender was not limited to a slave; it was apparently to the effect that, if a member of a man’s family (familiaris, i.e. a son or daughter in potestas or a slave) committed a theft of, or did mischief to, the property belonging to the principal, he had to be delivered by the principal to the delinquent child, or the owner of the slave or animal, should either surrender him or it to the person injured or make reparation in the usual course of matters. In other words, the noxal renders came to be regarded as means of avoiding the primary obligation of making reparation. But comparative jurisprudence recognizes in the enactment of the Tables a modified survival of the ancient right of an injured party to have the delinquent corpus—man, beast or thing—given up to him to wreak his revenge upon it privately, the modification consisting in the alternative of reparation offered to the owner. This noxal surrender, failing reparation, had gone out of use in the case of a slave or of an emancipated child in potestas before the time of Gaius, and was probably in the case of sons before that of Juystian; but it was still sanctioned so far as slaves and domestic animals were concerned even in that emperor’s legislation.

Guardianship and the Introduction of the Order of Agnates.—So long as Rome was patrician the gens apparently charged itself with the guardianship of a clansman’s orphan pupil children and his widow and unmarried daughters above pupillarity after his decease (tutela), as well as with that of male members of his family who were sui iuris, but above the age of pupillarity, when they chanced to lose a guardian, an unman, imbecile, prodigal or helpless (cuius curricutum). The gens appears to have been limited, one of its members to act as tutor or curator as the case might be, itself prescribed his duties, and itself called him to account for any failure in his administration.

But, as this gentle tutory could not be extended to the plebeians, among whom some law of guardianship was as much required as among their fellow-citizens of the higher order, the decemvirs found it expedient to devise a new one of universal application. The Tables contained no express authority for testamentary nomination of tutors to the widow
of the testator, or to his pupil children and grown-up unmarried daughters, but such appointment, if unknown previously, was so held to be justified by law when inward hint of the very inclusive provision, "uti legavit suae rei, ita jus esto.

In the absence of testamentary appointment the nearest male agnates of lawful age were to be tutors. This tutory of agnates was an invention of the decemvirs, just as was the agnates' right of succession on intestacy. The plebeians had no gentes, at least until a much later period; so, to make the law equal for all, it was necessary to introduce a new order of heirs and tutors. "Tutores...ex lege XII. Tabulam introducuntur....agnati" is the very notable language of Ulpian. And his words are very similar in speaking of their right of succession; for, while he says of testamentary inheritances no more than that they were confirmed by the XII. Tables, he explains that the legitimae hereditates of agnates and patrons were derived from them. The phrases legitima cognatio, legitima hereditas, legitimi heredes, tuta legiti, tutores legiti themselves proclaim the origin of agnation, agnatic inheritance and agnatic tutory; for, though the word legitimus might be applied to any institution based on status, yet in the ordinary case it indicated one introduced by the XII. Tables, the law of agnatic tutory; consequently, the text may be explained as more deductions by interpretation at a later time of the words "ne solvito" of the XII. Tables. At any rate it is pretty certain that before the close of the present period res nec mancipi as well as res mancipi could be held in quiritarian ownership.

The modes in which these two classes of things might be acquired in property were various. But there was this important difference: that, while a natural mode of acquisition suffered in the case of res nec mancipi, some civil one was necessary for the derivative acquisition, at all events, of res mancipi. The most important were mancipation, surrender in court, usuaption and bequest as singular modes, and inheritance, in manum convenio, adrogation and purchase of a confiscated estate, as universal ones. All of these, with the exception of mancipation, applied equally to res mancipi and res nec mancipi. But there was, in addition, for res nec mancipi, what was the commonest of all the modes of transferring things of this class, simple transfer. If the transfer of these things was made by the owner with the intention of passing the property, then the simple delivery of possession (traditio) was enough, unless indeed it was in virtue of a sale; in which latter case the ownership remained with the vendor, notwithstanding the change of possession, until the price was paid or security given for it. Only mancipation, surrender in court and usuagation, however, need be noticed at present.

The origin of the distinction between manciable and non-manciable things, and of the form of conveyance by mancipation applicable to the first, has been explained (supra, p. 520). Originally mancipation was not the imaginary sale that Gaius speaks of, but as real a sale as could well be conceived—the weighing in scales, held by an official, of the raw metal that was to be the consideration for the transfer of a res mancipi, and the handing of it by the transferee to the transferer, with the declaration that thereby and thereupon, the thing in question became his in proprietary right. On the introduction of coined money weights began to be used. This is before the time of Cicer, or of the Roman ceremonial, or sometimes left to be done afterwards; and though in that spirit of conservatism that was so marked in the adhesion
to time-honoured forms after their *raison d'être* was gone, the scale-bearing and the scales were still retained as indispensable elements of the manipulation, yet the scales were simply touched by the purchaser with a *rundaculum* or a single coin, in order that he might not be taken in, as it were, and not be able to examine in quittance right, and that by purchase (for such and such a price) with these scales and this bit of copper. And that one coin, says Gaius, was then handed by the transferee to the transferor at the moment of discharge (ipso *loclo*). Thus transformed, the manipulation was undeniably an imaginary sale; for the real price might have been paid weeks or months before, or might not be paid until weeks or months after. The manipulation had become nothing but a conveyance, and in this form it continued down to the end of the 3rd century of the Empire to be the appropriate mode of transfer of a *res mancipi*, or at least of conferring on the transferee of such a thing a complete legal title (dominium ex jure gratuitum). After that, however, it seems gradually to have gone into disuse, being inapplicable to lands out of Italy that did not enjoy what was called *ius italicum*; and long before the time of Justinian it had practically ceased to be used.

The effects of a manipulation, provided the price had been paid or security given for it, were that the property passed instantly to the purchaser, and that the transferee was held to warrant the conveyance against evasion from the moment the price was received. In the absence of either payment or security for it, the title still remained with the vendor, so that it was in his power, by means of a real action, to get back what had been manipulated, even though it had been transferred. If, however, the vendor's liability to the vendee in the event of evasion is usually supposed to have arisen *ipso jure*—that is to say, without anything expressly said about it; the acceptance by the transferrer of the coin as representing a part of the price was equivalent to his imposition upon him an obligation to maintain the transferee in possession, under a penalty of double the amount of the price, recoverable by the latter by what is usually called an *actio auctorilatias*. But this action was not *auctorilatias* in the ordinary sense, either really or fictitiously gratuitous (*nummo uno*),—really, in the case of donations, &c., fictitiously, when, on purpose to exclude the warranty, the recital of the transferee was that the price was a single sum.

The right of a vendee to sue an *actio auctorilatias* arose only when eviction resulted from a decree in a regular judicial process at the instance of a third party disputing his title, and was conditional on his being able to produce a part of what had been paid by him, its vendor (*auctor*) into the field to defend his own interests. And the duration of the *auctorilatias* was limited by the Tables to two years in the case of lands and houses, to one year in the case of other things. As possession for those periods was sufficient to cure any defect in the vendee's title, it was but reasonable that with their expiry the vendor's liability on his warranty should be at an end.

By a provision of the Tables in the very inclusive terms, "cum nexu servetur, ut causas igitur,** namque insanabilis, haud timida, carens, in the importance of mancipation was immensely increased; for any sort of qualification germane to the transaction might be superinduced upon it, and the range of its application thus greatly extended. As *auctorilatias* was a legal right, the parties could either voluntarily or by the act of a third party, either in a proper or improper form of *auctorilatias*, have the same principle adopted to make payment of the price a condition precedent of the transfer of property. The reason was that in form the right of the cessionary flowed from the magisterial decree; therefore its testator could say it is his, I declare it yours," and not from any act or word of the cedent's, who was passive in the matter.

Usucapion,* regulated by the XII. Tables, but not improbably recognized previously in a vague and uncertain way, converted uninterrupted possession (*usu*) into quittance property by efflux of time. The provision in the Tables, as given by Cicero, was to this effect: "*Usus auctoritas fundi biennium est, ceterarum rerum omnium annuus est.*" The relation in which the words *usu* and *auctorilatias* stand to each other has been a subject of much discussion; the prevailing opinion amongst modern civilians is that the two words should be taken disjunctively, the first alone referring to usucapion, and the second to the warranty of title incumbent on the vendor in a manipulation, and that both were limited to two years in the case of lands (and, by extensive interpretation, houses), and to one year in the case of anything else. But it is settled that possession of property, whether purchased or inherited by bequest, could pass only on a sufficient title and the possessor to be in good faith. But the decemviral code, as is now generally admitted, contained no such requirements; any citizen occupying immovables or holding movables as his own, provided they were usucapible and he had not taken them theretofore, acquired a quittance right in two years or one, as the case might be, simply on the strength of his possession. Originally, therefore, it was simply the conversion of *de facto* possession, no matter how acquired so long as not by theft, into legal ownership when prolonged for the statutory period,—too often the maintenance of right at the cost of a great deal of trouble and expense. It was more generally adoptable for the purpose of conveying to the party acquiring it, the title of the person from whom a transfer had been taken; and with the progress of

---

1. Cist. de Off. iii. 16, § 65. Some writers, e.g. Girard, *Manuel de droit roman*, p. 550, n. 5, take the view that, apart from the actio *auctorilatias*, it was only where the extent of the land was material (actio de modo agris) that the penalty of a *duplum* was *ipso jure* incurred. But this puts a gloss on Cicero's language.

jurisprudence it developed into the carefully regulated positive prescription which has to a greater or less extent found a place in every modern system. The conception of the abstract notion of a real right in (or over) the property of another person (jus in re aliena) is not to be looked for at so early a period in the history of the law as that now under consideration. The servitudes of water and way were no doubt very early recognized, for they ranked as res mancipi, and the XII. Tables contained various regulations in reference to the former. Usufruct, too, was probably not unknown; but the urban praedial servitudes bear the impress of a somewhat later jurisprudence. Pignonate and hypothecary rights were certainly unknown as rights protected by action. Between private parties the only thing legally recognized of the nature of a real security was the fiducia that is described above. Approaching more nearly to the modern idea of a mortgage was the security praedibus praedissimum required by the state from those indebted to it in assurance of their obligations. Here was the double guarantee of sureties (praedae) and mortgages of lands of theirs (praedica subsidia); but how they were dealt with when the debtor made default is by no means clear.

Changes in the Law of Succession.—The two forms of testament of the regal period, viz., that made in the comitia of the curies and that by soldiers on the eve of battle, still remained in use in the early Republic; though before the end of the Republic they were displaced by the general adoption of that executed with the copper and scales (testamentum per aes et libram). It seems to be the general opinion that it was the first two alone that the words applied which stood in the forefront of the provisions of the XII. Tables about inheritance: “uti legasit suae rei, ita jus est.” Whether resort was to the comitia or to the army, the testator’s own will in the matter was henceforth to be supreme. There was to be no more reference to the pontiffs as to the expediency of the testament in view of the interests of the family sacra and of creditors of the testator’s: from legislators, sanctioning a departure from the ordinary rules of succession, the assembled Quirites became merely witnesses. The testaments of the oral declaration of the testator’s will in regard to his inheritance.

The testament with the copper and the scales is depicted by Gaius as a written instrument. But he presents it in what might be described as the third stage of its history. Its probable origin has been explained (super, p. 534). It was originally not a testament but only a make-shift for one. A plebeian was not qualified in the regal period to make a testament in the comitia; so, instead, he transferred his estate to a friend on whom he could rely, with instructions how to distribute it on his death. The transferee was called familiae empitor; because the conveyance was in form a mancipation for a nominal price.

It is not at all unlikely that the same device may occasionally have been resorted to by a patrician who had neglected to make a regular testament, and was seized with mortal illness before he had an opportunity of appealing to the curies. But such a disposition was not a testament, and may not have been so called. A testamento was the nomination of a person as the testator’s heir. It made the person instituted as fully the representative of the testator after his death as his heir-at-law would have been had he died intestate. The original mortis causa mancipation that opened the way for the testament per aes et libram conferred upon the familiae empitor no such character. Gaius says that he stood in place of an heir (heredes loci), inasmuch as he had such of an heir’s rights and duties as the familiae empitor had it in his power to confer and impose; but the transaction was but a conveyance of estate, with a limitation of the right of the grantee. It has been argued that, as the law did not recognize conditional mancipation, the conveyance must have been regarded as a complete and immediate direct transmission of the grantee. But this does not follow. For it was quite competent for a man, in transferring property by mancipation, to reserve to himself a life interest; and apparently it was equally competent for him to postpone delivery of possession, without infringing the rules of testamentary mancipation itself he was empowered to do. So far as one can see, therefore, there was nothing to prevent the grantor of the conveyance (or quasi-testator) bargaining that he was to retain the possession till his death; and, as the familia was an entity, the testator might have applied for the purpose of estoppels. Whether so or not, without any change in its component elements, he must in such case have been as free to operate on it while he survived, as if he had never conveyed it by mancipation.

Cicero incidentally remarks—what indeed the nature of the transaction of itself very distinctly suggests—that the true testament with the copper and the scales had its statutory warrant, not in the uti legasit suae rei of the XII. Tables, but in the provision contained in the words: “cum nuncx faciat mancipiumque, uti lingua nuncupassiti, ita jus esto.” Reflection on the import and comprehensiveness of these words led the pontifical Interpreters to the conclusion that there was nothing in them to prevent the direct institution of an heir by testament and thereby provide for the complete and immediate direct transmission of the estate. From the moment this view was adopted and put in practice the familiae mancipatio ceased to be a transfer of the testator’s estate to the familiae empitor; the latter’s purchase was now for form’s sake only, though still an indispensable form, since it was it alone that, according to the letter of the statute, imparted efficacy to the nuncupatio. But it was the nuncupatio—the oral declaration addressed to the witnesses—that really contained the testamentary disposition, i.e. the institution of an heir, with such further provisions as the testator thought fit to embody in it. This was the second stage in the history of the testament per aes et libram. The third was marked by the introduction of tablets in which the testamentary provisions were set out in writing, and which the testator displayed to the witnesses, folded and tied up in the usual manner, declaring that they contained the record of his last will.

Gaius narrates the words spoken by the familiae empitor and addressed to the testator as follows: “Your estate and belongings (familia pecuniisque tua), be they mine by purchase with this bit of copper and these copper scales, subject to your instructions, but in my keeping, that so you may lawfully make your testament upon the strength of them to appoint tutors to wife and children, to enfranchise slaves and make bequests to legateses, but he might...” (Cic. De Orat. I. 57, § 245). On the above passage of Gaius, see Sohn, Inst. § 99.
even disinheriting a child in his *potestas* (*suus heres*) in favour of a stranger, so long as he did so in express terms. Institution of a stranger, without specific mention of the *suus heres*, however, was fatal, if the latter was a son; for without express disinheritance (*exheredatio*) his father could not deprive him of the interest he had in the family property as in a manner one of its joint owners. It can hardly be supposed that disinheritance was contemplated by the compilers of the Tables; it was foreign to the traditional conception of the family property as a body corporate. But if the *suus heres* could not be resisted when claimed as embraced in the *uti legati*, although generally disownned, and as far as possible restrained by the strictness of the rules imposed on its exercise.

In the absence of a testament, or on its failure from any cause, the succession opened to the heirs *ab intestato*. So notoriously was the *suus heres* entitled to the first place—and that not so much in the character of heirs as of persons now entering upon the active exercise of rights hitherto existing, though in a manner dormant—that the compilers of the XII. Tables thought it superfluous expressly to declare it. “If a man die intestate, leaving no *suus heres*, his nearest agnate shall have his estate. If the agnate also fail, his gentiles shall have it.” It has been pointed out already that, under the *tutorial* succession, the *tutelarius*, as a bond distinct from that which connected the gentile members of a clan, was due to the decemvirs. They had to devise a law of intestate *tutelarius* and succession suitable alike to the patricians who had *gentes* and to the plebeians who had none. To put the latter in exactly the same position as the former was beyond their power; for the fact had to be faced that the plebeians had no gentile institutions, and to create them was impossible. The difficulty was overcome by accepting the principle of agnation upon which the patrician *gens* was constructed, and establishing an agnostic circle of kinsmen (perhaps at first limited to the sixth degree) to which the *gens* as a collective body should be postponed in the case of the patricians, and which should come in place of it in the case of the plebeians. It was not perfect equality, but the nearest approach to it that the circumstances permitted. The difference was that, when the agnates of a plebeian intestate failed, his inheritance was vacant; whereas, on failure of those of a patrician, there was devolution to his *gens* in its collective capacity. Two **interpretations** put upon the statute had an important bearing in this connexion, viz. (1) that, if the nearest agnates in existence declined the succession, those next in degree were not allowed to take it; and (2) that no female agnate could take it more remote than a sister of the deceased intestate. The division among two or more agnates was always per capita, not per stirpes.

The order of intestate succession thus established by the XII. Tables, which prevailed until amended by the praetors probably in the 8th century of the city, was first to the *suus heredes* of the deceased, next to his nearest agnate or agnates, and finally, if the deceased was a patrician, to his *gens*. His *suus heredes*, speaking broadly, were those of his descendants in his *potestas* when he died who by that event (or even after it, but before his intestacy became manifest) became *suus juris*, together with his wife in *manu* (who, as regarded his succession, was reckoned as a daughter), but they did not include children whom he had emancipated or had passed in *mansum* of a husband. Emancipated or *capta* children did not in the case of failure of *suus*; for emancipation severed the tie of agnation as well as that of *potestas*. For the same reason no kinsman who had been emancipated, and so cut off from the family tree, could claim as an agnate; for those only were agnates who were subject to the same *patria potestas*, or would have been had the common family head been still alive.

The opening of a succession (technically *delatio hereditatis*) in favour of *suus heredes*, whether in virtue of a testamentary institution or by operation of law on intestacy, at once invested them with the character, rights and responsibilities of heirs. No acceptance was necessary, nor, according to the rules of the *jus civile*, was any declinatory competent. They had been all along in a manner joint owners with their parent of the family estate, which by his death had become, nominally at least, an inheritance; and, as he had not thought fit to terminate their interest in it by emancipating or disinheritting them, they were not now allowed to disown it. Hence they were both as necessary heirs (*heredes et necessarii*). A slave, too, whom his owner had instituted in his testament with gift of liberty was a necessary heir; he could not decline, and was invested with the character and rights of a joint owner; but, in contrast with stranger institutors or agnates taking on intestacy: they were free to accept or reject the inheritance as they saw fit; consequently, an act of acceptance (*aditio*) was necessary on their part to make them heirs.

This was a formal declaration before witnesses, which got the name of *cretio*. It was not unusual for a testator, in instituting an heir, to require that he should make a formal declaration of acceptance within a limited time, failing which his right should pass to someone else. Thus, with turn and turn again, was done in his lifetime; and so on with any number of substitutes, the series ending with one of his slaves, who became heir without entry, and thus saved the testator from the disgrace of *post mortem* bankruptcy in the event of the inheritance proving insolvent. The *suus heredes* of the Tables, as interpreted by the pontiffs, conferred upon a testator very great latitude of testamentary disposition, even to the extent of disinheritance of *suus heredes*. This was a course, however, that was probably rarely resorted to unless when a child had been guilty of gross ingratitude, or when the parent had reason to believe his estate was insolvent and desired to protect his children from the responsibilities of inheritance. Usually his *suus*; if he had appointed another heir, he had to be willing to either abandon the estate altogether as heir of it, or to appoint another heir, who was not his testator had predeceased or been emancipated, or who had been retained in his grandfather’s *potestas*, took amongst them the share to which their father would otherwise have been entitled, instead of taking equal shares with their surviving uncles. It was not possible to limit the use of the right of representation to sons, for them to hold it in common for many years as quasi partners (consors); but any one of them was entitled at any moment to claim a partition which was effected judicially, by an arbitral procedure where the XII. Tables left the matter in a state of *familiae eriscandae*. Where two or more strangers were instituted testamentarily, whether to equal or unequal shares, if one of them failed either by predecease or decline* to* regard the other; it was a matter of verbal that a man could not die partly testate and partly intestate. There was the same accrual among agnates on intestacy; and both they and stranger testamentary institutes had the same effect as the division of the inheritance that was made use of by *suus heredes*.

According to Gaius it was as a stimulus to heirs to enter as soon as possible to an inheritance that had opened to them, and thus make a mark on it, provisionally or otherwise, by being reckoned as creditors of the deceased and attending to his family *sacra*, that the law came to recognize the somewhat remarkable institution of usucapion or presumptive acquisition of the inheritance in the character of heir (*usucapio pro herede*). Usucapio pro herede. If the deceased had left *suus heredes*; for the inheritance vested in them the moment he died. But, if there were no *suus heredes*, then any person taking possession of the property that had belonged to the deceased and holding it for twelve months without relinquishing it, thereby acquired it as if he were heir: in fact, according to the views then held, he acquired the inheritance itself. Gaius characterizes it as a dishonest acquisition, inasmuch as the usucapient knew that he had no immediate heir, and if he had been merely explained, the usucapio of the XII. Tables did not require *bona fide* on the part of the usucapient; he might acquire ownership by prolonged possession of what he knew did not belong to him; and was perfectly entitled to it if he knew it belonged to another. But an inheritance unappropriated by an heir who had nothing more than a right to a claim in it belonged in strictness to no one; and there was no theft, therefore, when a stranger was in possession of property belonging to an heir. There can be little doubt that on the completion of his possession he was regarded as heir just as fully as if he had taken under a testament or as heir-at-law on intestacy—that is to say, that he was held responsible to creditors of the deceased person and entitled to his property. Gaius does not say much; but both the Coruncanian and the Mucian edict imposed the latter burden upon him who had usucapied by possession the greater part of a deceased person’s estate; and it is but reasonable to suppose that the burden of debts must in like manner have fallen on the usucapient or usucapians in proportion to the shares they had taken of the deceased’s property.

---

1 This was for freeborn citizens; for freedmen, the patron (or his *children in potestas*) took the place of the nearest agnates.

2 Gai. ii. 164-173.

3 Ciec de leg. ii. 48, 49.
The Law of Obligations.—In his Liber Aesorum Gaius says that obligations arise from either contract or delict, or miscellaneous causes (variae causarum figurae). But those arising from contract fill a place in the later jurisprudence vastly greater than those arising from delict. In the XII. Tables it was different. In them delicts were much more prominent than contracts—wrongings entitling the sufferer to demand the imposition of penalties upon the wrong-doer that in most cases covered both reparation and punishment. The disproportion in the formulated provisions in reference to the two sources of obligation, however, is not surprising. For, first of all, the purpose of the decemviral code was to remove uncertainties and leave as little as possible to the arbitrariness of the magistrates. In nothing there was more scope for this than in the imposition of penalties; and, as different offences required to be differently treated, the provisions in reference to them were necessarily multiplied. In the next place, the intercourse that evokes contract was as yet very limited. Agriculture was the occupation of the great majority; of trade and commerce there was little; coined money had hardly begun to be used as a circulating medium. Lastly, the safeguards of engagement lay then to a great extent in the sworn oath or the pledged faith, of which the law (jus) hardly yet took cognisance, but which found a protection quite as potent in the religious and moral sentiments that had so far a hold on the people.

It may be asked—if a man purchased sheep or store cattle, a plough, a toga, a jar of wine or oil, had he no action to compel delivery, the vendor no action for payment of the price? Did the farmer who hired a horse to a passer-by or another horse to a third, have a right of action? The latter question was answered in the affirmative by the provision that privilege was available to the owner or possessor of the animal to sue for the return of the same. But what of the former? It is said that the use of words of style before persons who could if necessary bear witness to them; whereas an engagement incident to a mancipation, or an undertaking to repay borrowed money, required in addition a ceremony with the copper and the scales. This undertaking to repay arose from the contract of nexum, which was, it is thought, older than the Tables; both it and the verbal contract by sponsio or stipulation, which was younger, require further consideration.

The Nexial Contract.—The tumults and seditions so frequent in Rome during the first two centuries of the Republic are as frequently attributed by ancient writers to the abuses of the law of debt as to any other cause, social or political. The circumstances of the poorer plebeians were such as to make it almost impossible to avoid borrowing. Their scanty means were dependent on the regular cultivation of their little acres, and on each operation of the agricultural year being performed in proper rotation and at the proper season. But this was every-now and again interfered with by wars which detained them from home at seed-time or harvest, practically rendering their farms unproductive, and leaving them and their families in straits for the common necessaries of life.

The practice of lending per libram was doubtless of great antiquity—indeed, the intervention of the scales was a necessity when money or what passed for it had to be weighed instead of counted; and not improbably old custom conceded to a lender who had thus made an advance in the presence of witnesses some very summary and stringent remedy against a borrower who failed in repayment. Now, after the Servian reforms, it was subjected to much the same formalities as were required for mancipation has been shown already. With the introduction of a coinage the transaction, instead of being per libram simply, became one per aequi et libram; the scales were touched with a single piece, representing the money which had already been or was about to be paid, a formula recited whereby the obligation of repayment was imposed on the borrower, and an appeal made to the witnesses for their testimony. Unfortunately this formula is nowhere preserved. Huschke assuming that the lender was the only speaker, formulated it thus: "quod ego tibi mille libras hoc aequae librae nexis dedi, eas tu mili post annum juris nixi darem damnas esto "—" whereas with this coin and these copper scales I have given thee a thousand asses, be thou therefore bound juris nixi to repay them to me a year hence." The phrase damnas esto, like the rest of the formula, is unsupported by any conclusive authority;  

1 The modern literature on the subject of nexum is very large and the name of it are discordant. The fundamental work is that of Huschke, Uber d. Recht des Nexum (Leipzig, 1846). Danz. (Gesch. d. rom. Rechts, 11. 2nd ed., 1873, § 146) gives a list of the more important works about it and a résumé of the principal subjects. Do to this list, with dates, may be added: Bekker, Die Aktionen des rom. Privatrechts, 1. (Berlin, 1871), c. 1; Brinz, "Der Begriff obligatio," in Grünhut’s Zeitrschrift, 1. (1874), ii. 27; and Voigt, XII. Tafeln, 1. §§ 63-65; Girard, "Intérêts."
but, as it is in harmony with the formula which is given by Gaius for dissolving an obligation of this kind, and with that most frequently employed in the Republic for imposing by a public act liability to pay a fixed and definite sum, it may not be wide of the mark.

What was the effect of this procedure? The question is one not easily answered. Brinz expressed the opinion that the creditor was entitled in virtue of the nexum to take his debtor into custody at any time when he considered such a course necessary for his own protection, even before the conventional term of the nexus ran out; that the debtor was in bonds, virtually a pledge, from the very first, and the tightness or looseness of them a matter in the discretion of his creditor. Volgt holds that the nexum did not give the creditor the right to hold his debtor captive, and that the latter's failure to repay an ordinary action was necessary, to be followed by the usual proceedings in execution if judgment was in favor of the former. These views may be said to be the two extreme positions between them lie a great many others, more or less divergent. The difficulty of arriving at a conclusion is caused to some extent by the ambiguity of the words nexum and nexum. The transaction itself was called nexum and occasionally also nexus; the money advanced was nexus aes (hence nexus, i.e. ares, datum); the bond was nexus (of the fourth declension); and the debtor on whom the bond was laid was also nexus (of the second). All this is simple enough. But we find the same word nexus employed by historians in the sense of a certain form of purchase when the condition of a debtor put in letters by his creditor. That might be the condition either of a nexal borrower or of an ordinary judgment-debtor. The former in such a case was doubly nexus; he was not only under the constraint of the debt but the physical constraint. In many passages in which Livy and others speak of the nexi it is extremely difficult, sometimes impossible, to be sure in which sense they use the word. It is therefore not surprising that there should be considerable diversity of opinion on the subject.2

Since Huschke, the great majority of writers—Volgt,3 Lenel and Mitteis are distinguished exceptions—concur in opinion that the local custom extended the creditor after expiration of the days from the conventional date of repayment of the loan, to proceed against his debtor by manus injuncto without any antecedent action or judgment, and failing settlement to detain him, and put him to the penalties of long and forceful treatment. The bond of the loan was repaid. The parallel of such a course is to be met with amongst many ancient nations—Jews, Greeks, Scandinavians, Germans, &c.4 And it was not altogether unreasonable. If a borrower had sold or mortgaged everything he possessed of any value, what other course was open to him in his necessity except to impede himself? That the creditor should have been entitled to reduce him to such a state of natural necessity at a time before the debt was discharged is claimed by few. It was very nearly a court of law is equally intelligible. It was just a case of regulated self-help. The nexal contract was a public act, carried out in the presence of the five citizen witnesses and liberiprians, who probably refused the background of the whole transaction and of the tacit engagement of the debt. The only objection apparently that could be stated against the creditor's apprehension of his debtor in execution was that the indebtedness no longer existed—that the loan had been repaid. But a nexal debt

1 Brinz, in Grünhut's Zeitschr. i. 22. He likens the position of the nexum to that of a thing—land, say—mortgaged to a creditor in security of a claim. Such security the Roman jurisprudently constant speak of as res obligata, and sometimes as res nexus. As Brinz observes, the thing was obligata from the first, and continued so as long as the debt it secured was unpaid, even though the creditor should have been unnecessary to reduce it to possession or interfere with it in any way.

2 As to the use of the terms nexus and nexum by the classical jurists, see Roby, Roman Private Law (1902), vo. ii. pp. 296 seq.

3 Negotiations created nexus did not impose any immediate liability on the borrower which the lender could enforce without judicial intervention, but that the latter required to proceed against the former in ordinary course, by what he calls an aetio petitione. Mitteis, in his essay, without a considerable extent, Volgt's views as to the necessity of further proceedings after the nexal contract, and rejects the notion of non-judicial manus injuncto, but regards the actio pecuniae nuncupatae as non- procedural. See the article by W. Mercken (Form. ii. 27), in which the same author, in connection with the proceedings according to Lenel, Z. d. St. Stift. 84 seq. there was also enacted any nexal contract of loan, and the whole doctrine on the subject has therefore no solid foundation.

4 See authorities in Brinz's paper in Grünhut's Zeitschr. i. 25. The great phrase is eti egeriius suadent. There is a curious style in Marcus1 (Form. ii. 27), in which a borrower engages that, until he shall have repaid his loan, his creditor shall have right to his services so many days a week, and shall have power to inflict corporal punishment if there be dilatoriness in rendering them.

could be legally discharged only by nexum libertation, which also was a solemn procedure per aetis et libam in the presence of five citizen witnesses. What need for a judicial inquiry in the presence of so notorious a creditor would rarely be daring enough to proceed to such an extent? But such a practice, however disquieting, might be accounted for. There seems no good reason for distinguishing a nexus from a jadicaus, by the mere contract in these respects. Unenables the notion at any rate that the nexus by the mere contract was placed in loco aetis, or that by another's personal act, and without any judicial process, in the loan, the mere contract, of which certain states distinctly that he still retained his position in the census and in his tribe. Many a time when the exigencies of the state required it, were the next temporally released in order to oblige the debtors to subdue themselves on them as citizens. The nexal debtor's position after arrest in regard to his family rights is obscure. If originally they shared his nexal condition, this did not long continue to be the law. He was a hostage, and such a man was suum manus over his wife and potestas over his children. Their earnings legally belonged to him, and did not fall to his creditor. It was the body of his debtor that the creditor was entitled to, and too often went. His left hand was raised on oath, the protection; there was as yet no machinery for attaching the debtor's goods in substantial reparation for the loss caused by his breach of contract.

The abuses to which this system of personal execution gave rise were great. Livy tells us that in the year 428 B.C. (326 B.C.) a more than ordinarily flagrant outrage committed by a creditor upon one of his young nexti, who had himself voluntarily assumed the position of debtor, his father, roused the populace to such a pitch of indignation as to necessitate instant remedial legislation. The result was the Poctilian law (Lex Poetilia Papiria). So far as can be gathered from the meagre fragments of it we possess, it contained at least these provisions—(1) that letters and neck, arm or foot blocks should in future be applied only to persons undergoing imprisonment for crime or debt; (2) that no one should ever again be the nexus of his creditor in respect of borrowed money; and (3) that all existing nexi should be rescinded. The first was intended to prevent the necessary restraints upon judgment-debtors formally given over to their creditors. The second did not necessarily abolish the contract of loan per aetis et libam, but only what had hitherto been an injuncto. It is—his creditor right to incarcerate his debtor without either the judgment of a court or the warrant of a magistrate. For the future, execution was to be done against a borrower only as a judgment-debtor formally made over to his creditor; it was to be a legal proceeding. The nexal debts, however, was imposed by the Poctilian law itself. This very soon led to the disuse of nexal obligation; once it was deprived of its distinctive processual advantages it rapidly gave place to the simpler engagement of a formal stipulation. The stipulation, an agreement, for the release of the then existing nexi, Cicero, Livy and Dionysius say nothing of any condition annexed to the bond the statute conferred upon them; but Varro limits it to those qui non omnem parum (parum) dari habent done their best and could do no more to meet their creditors' claims.5 Such a limitation can hardly be called unreasonable, even were we to assume—as probably we ought to do—that the release spoken of was nothing more than a discharge from the bonds of physical restraint, not from those of legal obligation.

Introduction of the Stipulatio.6 Few events in the history of the private law were followed by so far-reaching consequences than the introduction of the stipulation. It exercised an enormous influence on the law of contract; for by means of it there was created a unilateral obligation that in time became adaptable to almost every conceivable undertaking by one man in favour of another. By the use of certain words of style in the form of question and answer any lawful agreement could thereby be made not only as between the parties, but between them and even the State. See Gennard, Infamia, 206, and authorities there cited.

morally but legally binding, so that much which previously had no other guarantee than a man's sense of honour now passed directly under the protection of the tribunals. Stipulation became the complement of engagements which without them rested simply on good faith, as when a vendor gave his stipulatory promise to his vendee to guarantee peaceable possession of the thing sold or its freedom from faults, and the vendee in turn gave his promise for payment of the price. The question and answer in the form prescribed by law made the engagement fast and sure. Hence the generic name of the contract; for Paul's derivation of it from stipulium, "firm" (which itself comes from stipes, a staff), is to be preferred to that of Varro and Festus from stips (money), or to a later and rather fanciful one from stipula (a straw). It was round the stipulation that the jurists grouped most of their dissempuses upon the dogmatic laws of the contract—capacity of parties, requisites of consent, consequences of fraud, error and intimidation, effects of conditions and specifications of time, and so forth. It may well be said, therefore, that its introduction marked an epoch in the history of the law.

There is, however, no certainty either as to the time or as to the manner of its introduction. So far as appears, it was unknown at the time of the Twelve Tables; at least in primitive forms one of the first unmistakable allusions to it is in the Aquilian law of about 287 B.C. The mention of it in that enactment, however, is with regard to a phase of it which cannot have been reached for many years after its introduction, and the probability is that it originated before the middle of the 5th century of the city, its first statutory recognition being in the Aquilian law introducing the legis actio per condicionem (infra, p. 550). In its earliest days it bore the name of stipulatio but of sponsio, for the reason that the interrogatory of the contractor confessor was introduced in the form of the word sponses—e.g. centuri dare sponses—while the answer was simply spondee.

There has been much speculation as to the origin of the contract. Modern commentaries have three theories: (1) that it was a natural remnant of the nexum, after the business with the copper and the scales had gone into disuse; (2) that it was evolved out of the oath (jura randum or sponsio) at the great altar of Hercules and the appeal to Fides (supra, p. 534); (3) that it was imported from Latium, which it had reached from some of the Greek settlements farther south. The last view is the most probable, though there is much to be said also in favour of the second theory.1

The contract was regulated by Festus, connects it with the Greek στειρευτη and σπυρω, and Gaius incidentally observes that it is said to be of Greek origin. A libation (σπυρω) is frequently referred to by Homer and Herodotus as an accompaniment of treaties and other solemn covenants—a common offering by the parties to the gods with a view to their perpetuation. Later, the opinion that the practice passed into Sicily and Lower Italy, but that gradually the libation and other religious features were dropped, although the word σπυρω was retained in the sense of an engagement, and admitted by parties just as if the old ritual had been observed, and that it travelled northward into Latium and thence to Rome under the name of sponsio, being used in the first instance in public life for the conclusion of treaties, and afterwards in private life for the conclusion of contracts. The meaning of sponses is a question by a creditor to his debtor (although latterly, we may well believe, unknown to them) thus came to be: "Do you engage as solemnly as if the old ceremonial were gone through between us?" There are recorded words which seem as familiar to us as familiar than when a man says, "I give you my oath upon it," without either himself or the individual addressed thinking it necessary that the form should be gone through.

It is not a little remarkable that the use of the words sponses and sponsdeo in contracting were, down at least to the time of Gaius, confined in Rome to Roman citizens. The sponsio as a form of contract was essentially juris civilis. So at first were the later and less solemn forms of stipulation—promissio, promitto, fideipromissio, fideipromitto, fideipromitto. Gaius speaks of these latter, along with such simple forms as dabo necesse faciam, as juris gentium, i.e. binding even between Romans and peregrins. Such they became eventually, but peregrins probably could not make use of the stipulation until a good while after the lex Silia. Yet although juris civilis, both the sponsio and the later forms were

from the first free from many of the impediments of the earlier actus legitimi. No witnesses were required to assist at them; and they were always susceptible of qualification by conditions and terms. It was in later times, however, before parties had much latitude in their choice of language, sponses was peculiarly solemn that no equivalent could be admitted; and even the later styles may be said to have remained stereotyped until well on in the Empire. And it was the use of the words of style that made the contract. It was formal, not material; that is to say, action lay upon the promise the words embodied, apart from any consideration whether or not value had been given for it. In time this serious disadvantage was abated by prae- torian exceptions and otherwise, as will be noted below. Originally the stipulation was employed only in regard to engagements whose terms were in every respect definite and certain, and was enforced by the legis actio per condicionem, or sometimes possibly by actio sacramento in personam. But in time it came to be employed in engagements that were from the first indefinite. This seems to have been due to the intervention of the praetors, and to have received special impetus after the system of the legis actions had begun to give place to that per formulas. The remedy in such a case was not spoken of as a condition but as an actio ex stipulato.

iv. The Actions of the Law.

The Legis Actiones generally.—We owe to Gaius the only connected (though, owing to the state of the Verona MS., rather fragmentary) account we possess of the legis actiones, as the system of judicial procedure which prevailed in Rome down to the substitution of that per formulas by the Abetnian and Julian laws—the first either in the 6th or early in the 7th century of the city, and the second in the age of Augustus. He tells us that as genera agendi or generic forms of process they were five in number, each taking its name from its characteristic feature, viz. (1) sacramento, (2) per judicis postulationem, (3) per condicionem, (4) per manus injectionem, and (5) per pignoris capiencis. The third was unknown in the decemviral period, and was introduced by the Aquilian law formerly mentioned. The other four were all more or less regulated by the XII. Tables, but must in some form have been anterior to them. It is utterly impossible, however, to say of any of them, apart from the condicites, at what time it was introduced, or what was the statute (lex) by which it was sanctioned; it may well be that they were not of statutory introduction at all, but were called legis actions simply because recognized and indirectly confirmed by the Tables. In character and purpose each of the five had its peculiarities. The first three were directly employed for determining a question of right or liability, which, if persistently disputed, inevitably resulted in a judicial investigation. The fourth and fifth might possibly result in judicial intervention; but primarily they were proceedings in execution, in which the party moving in them worked out his own remedy. As regards their comparative antiquity, there is much to be said for the opinion of Jhering and Bekker that manus injectus, as essentially nothing more than regulated self-help, must have been the earliest of the five, and that the legis actio sacramentum and the judicis postulatius must have been introduced in aid of it, and to prevent too hasty resort to it where there was room for doubt upon questions either of fact or law.

1 The literature on the subject is very voluminous, great part of it in periodicals. Among the best general works are: Keller, Der röm. Civilprozess u. die Actions (6th ed. by Wach, Leipzig, 1883), §§ 12–21; Bethmann-Hollweg, Der röm. Civilprozess (3 vols., Bonn, 1866–1866), the first volume of which is devoted to the legis actiones; Delle Leggi romane, Delie Leggi Romane (Pisa, 1868); Bekker, Die Aktionen d. röm. Privatrecht (2 vols., Berlin, 1871–1873), particularly vol. i. pp. 18–74; Karlowa, Der röm. Civilprozess zur Zeit d. legis Actiones (Berlin, 1872); Padeletti, Le Legis Actions, in the Archivio Giuridico (1875), xvii, 321 sqq.; Schulze, Privatrecht u. Prozess in ihrer Wechselbeziehung (Freiburg, 1883), i. 439–532, in which some novel and not unimportant views are presented; Jobbé-Duval, Études sur l'histoire de la procédure civile chez les Romains (1896), vol. i.; Girard, Organisation judiciaire, i. 15–20, 56–104, 167–252.2

2 See the arguments in favour of this theory in Girard, Manuel, 4th ed. pp. 462 sqq.

3 Graeco-Italische Rechtsgeschichte (Jena, 1884), pp. 465–70. Upon the ponensis vinculum, see Livy, ix. 9.
In the three judicial legis actiones the first step was the in jurce vocatio or procedure for bringing the respondent into court, minutely regulated by the provisions of the first of the XII. Tables. This was not done by any of the officers; there was no summons by the magistrate or by court order. The defendant himself had to do it himself. If the defendant did not appear, there could be no decree by default. Once before the magistrate (consul or praetor), the plaintiff stated his contention. If admitted or for the defense, the defendant, at once pronounced his decree, leaving the plaintiff to work out his remedy as the law prescribed. But, if the case presented was met either with a denial or counterclaim, the magistrate remitted it for trial either to a collegiate tribunal or to one or more private judges or arbiters. The act of remittal was technically litis contestatio or ordinator judicium, the first so named because originally the parties called upon those present to be witnesses to the issue that was being sent to the court. The second was from the understanding that all the system of the legis actiones and that of the formulæ, and continued to exist until the time of Diocletian. In the first stage the proceedings were said to be in jurce, and the duties of the magistrate in reference to his own court were performed by the judge, which were said to be in judicio, those presiding in it being styled judices. All that the judge or judges had to do was to pass judgment on the question referred to them. They were "right-declarers" only, not right-enforcers. If their judgment was wrong, he failed to do it himself, and it was wrong, and he failed to obtain a public settlement, he had himself to make it, to have it, and to have it, by subsequent proceedings by manus injuncto, and that court itself among those of the magistrate, in which under the eye of the magistrate, not of the judge.

For the first time, the law was given a new form of the cause, because the causes proper to the centurial court the conclusion seems warranted that it was its peculiar province to decide questions of quiritary right in the strictest acception of the word. They were all apparently in his time it was usually accompanied by a formal written or oral statement of facts, given to the magistrate, and to whom the latter administered such questions in course of time, and possibly at first of express consent of parties, came to be referred to a single judge; but some, and notably claims of inheritance under or in opposition to a testamentary disposition, were referred to the centurial court, as in the classical period. Personal actions, however, do not appear ever to have fallen within its cognizance: they were usually sent to a single judge—a private citizen—selected by the parties, but not by the magistrate, and to whom the latter administered an oath of office. But, in a few cases in which an action involved both a disputed question of right as the exercise of skill and discretion in determining the nature and extent of a right that in the abstract was not denied, the remittal was to a plurality of private judges or arbiters, usually three.

The Legis Action Sacramento. The characteristic feature of this legis actione, as described by Gaius, was that the parties, after a somewhat dramatic performance before the magistrate, each challenged the other to stake a certain amount, the amount of which was fixed by the Tables, and which was to be the issue of the inquiry by the court or judge to whom the case was eventually remitted. This state Gaius refers to indirectly as sacramentum, summam sacramenti, and poena sacramenti. The formal question the court had to determine was—whether the right to be justly, whose not (cuius sacramentum justum, cuius injustum) the first was returned to the staker, the second forfeited originally to sacred and afterwards to public usages. But the decision on this formal question necessarily involved a judgment on the matter actually in dispute, and, if it was for the plaintiff, entitled him, failing an amicable arrangement, to take ulterior steps for making it effectual. The procedure was still employed in the time of Gaius in the few cases that continued to be referred to the centurial court, but otherwise it had been long in disuse.

Gaius explains that it was resorted to both in real and personal actions. Unfortunately the MS. of his Institutes is defective in the passage in which it describes its application to the latter. We possess the greater part of his account of the actio in rem as employed to raise and determine a question of ownership; but his illustration is of vindication of a slave, and not so interesting or instructive as the proceedings for vindication of land. These, however, can be reconstructed with tolerable certainty with the aid derived from other sources, especially from Cicero, Varro and Gellius.

The parties appeared before the magistrate, each carrying a rod (fistula) representing his spear (quar or hasta), the symbol, as Gaius says, of quiritarian ownership. The first word was spoken by the raiser of the action, and addressed to his opponent: "I say that the land in question [describing it sufficiently for identification] is mine in quiritary right (meum esse ex jure quiriturin); therefore I require you to go there and join issue with me in presence of the magistrate (in jure manum conservato)". Thereupon, according to the earliest practice, the magistrate and the parties, accompanied by their friends and backers, proceeded to the ground for the case was tried. The court was then adjourned, and the parties, accompanied by their friends, etc., went to the land itself. As distances increased, however, and the engagements of the consuls multiplied, this became inconvenient. Instead of it, the parties went to the spot without the magistrate, but on his order, and the case was tried. Within a few seconds, or in the opening speech, the adversary had to be ordered to accompany them, and who probably made a report of the due observance of formalities on their return. Still later the procedure was further simplified by having a turf or sheet of turf given them by the magistrate before the case was heard. It was afterwards proved before the magistrate's chair; and, when he ordered the parties to go to the ground and join issue, they merely brought forward the turf and set it before him, and proceeded to make their formal vindication of it as appropriate to the case.

The ritual was as follows: The raiser of the action, addressing his adversary, again confirmed his ownership, but this time with the significant addition: As I have asserted my right by word of mouth, so let you do likewise by word, and if you have touched the turf with his rod, which was called vindicona when employed for this purpose. The magistrate then asked the other party whether he meant to counter-vindicata. If he refused to take it, or to negative or made no response, there was instant decree (addictio) in favour of the first party, and the proceedings were at an end. If, however, he counter-vindicated it, was it repeated by the same words and going through the same form as his adversary. The case was then heard, and it was said, and again, as if I too lay my vindicta upon it. The verbal and symbolic vindication and counter-vindication completed what was technically the manus consortio. The parties were now in this position: each had a rod over his shoulder, and the adverse party was to place his rod in maintenance of his contention. But the matter was to be settled judicially, so the magistrate once more intervened and ordered both to withdraw from the land. The dialogue was then resumed, and the second party was ordered to vindicate his land, to state upon what pretence (causa) he had counter-vindicated. In the illustration in Gaius he avoided the question and pleaded the general issue: I have done as is my right in laying my vindicta on the land. But there can be little doubt that in certain circumstances the counter-vindicate would deem it expedient to disclose his title. This was very necessary where he attributed his right to a conveyance upon which two years' possession had not yet followed; in other cases he had a need to say what he had done, or why he desired to preserve recourse against the latter on the warranty implied in the mancipatio. That probably entailed a suspension of the proceedings to allow of the author's citation for his interest; and we may suppose that he admitted his auctotitas, he was formally made a party to the action.

The proceedings had now reached the stage at which the sacrament came into play. The first challenge came from the vindicata, and it was a case of a sacrament of 500 asses, to which the counter-vindicate responded, —And you. This was technically the sacramentum provocatio. The magistrate thereupon remitted the matter to the court of trial to the centurial court, and the case was then heard, and what exactly was the question put in issue which the court or judge was to decide. The parties then called upon the bystanders to be witnesses of the magistrate's remittal, this appeal to witnesses like a modern case. At the same time, according to Gaius's account of the procedure, the magistrate required sureties from the parties for the eventual payment by him who was unsuccessful of the sacrament he had offered to
stake, and which became a forfeit to the exchequer. (The original practice probably was for the stake to be deposited by both parties in the hands of the pontiffs before they were heard by the judge or judges; after judgment that of the gaining was restored to him, while that of the losing party and the surcharges were retained for public benefit. The parties might have been required to deposit all the fruits and profits drawn in the interval. At the trial, as both parties were vindicants, there must have been a certain burden of proof upon both sides. The vindicant, one may believe, must have been required to establish in the first instance that the thing disputed was within the jurisdiction of the praetor. But if he failed then, the counter-vindicant would have to prove a later title in his person sufficient to exclude that of his opponent. The judgment, as already observed, necessarily involved a finding on the main question, and if the praetor found against the busis, it is true, but by this finding, the case of the party that prevailed was declared to be just, and that of his unsuccessful opponent unjust.)

Looking at this ritual as a whole, the conviction is irresistible that it was a practice that ran much against the interests of the possessor. It included a threefold stage: the first stage was that which is termed the praetor's "prroximation," which was the period during which the possessor, having had his case determined in the praetor's court, might appeal to the "senatorial group," for confirmation of his case. As Gellius tells us in his book, "while two days had been maintained at the seat of the praetor, he gave place to a civil and feistracular combat in which words were the weapons, and which was to be settled by the interposition of the praetor. But this does not explain the sacramentum. Various theories have been put forward to account for it. But it was nothing more than the sum of money staked by each of the parties, which was forfeited originally to sacred and afterwards to public uses by him who was unsuccessful, as a penalty for having become involved in a litigious case; and substantially the same explanation is given by Festus in one of his definitions of the word. But this is far from satisfactory, for it involves the apparent absurdity of declaring that a penalty imposed by law, could be that of the party who had been right, and at the same time the case of the party who was in the wrong. There is another definition in Festus—"a thing is said to be done sacramentum when the sanction of an oath is interposed"—that lends support to the opinion that there was a practice that ran much against the interests of the possessor, to take an oath to the verity of their respective assertions; that they were also required concurrently to deposit five bullocks or five sheep, according to the nature or value of the thing in dispute, to oblige the issue of the inquiry; that the question for determination was the relative value of the oxen or sheep, who was found to have sworn unjustly forfeited his ox or sheep as a piaementum—a peace-offering to the outraged deity—while the other party reclaimed his from the repository in which they had been detained in the meantime. The posseor (hence the name of the word) was at liberty to sue, if he thought fit, within the period of time fixed by the Senate, and in case of default of the defendant to get some profit for their temples."

1 It was the Lex Aenaria Tarpeia of the year 453 B.C. that compeded the five bullocks and five sheep into 500 and 50 Ib of copper respectively (Cic. De Rep. ii. 35; § 60, where the words usually printed "500 sesterces")—that lends support to the opinion that there was a practice that ran much against the interests of the possessor, to take an oath to the verity of their respective assertions; that they were also required concurrently to deposit five bullocks or five sheep, according to the nature or value of the thing in dispute, to oblige the issue of the inquiry; that the question for determination was the relative value of the oxen or sheep, who was found to have sworn unjustly forfeited his ox or sheep as a piaementum—a peace-offering to the outraged deity—while the other party reclaimed his from the repository in which they had been detained in the meantime. The posseor (hence the name of the word) was at liberty to sue, if he thought fit, within the period of time fixed by the Senate, and in case of default of the defendant to get some profit for their temples."

2 Varro, De L. L. v. 180, says that, even after the summa sacra mentment had been converted into money, it was deposited ad pontem in a "grand amphitheater"—so called, according to Festus ("sacramentum")—"a "grand amphitheater"—so called, according to Festus ("sacramentum"). It is very probable that at the time this practice was in force, an amphitheater was not for the purpose of theatrical performances; it was more likely a kind of market-place, and the name was given in allusion to the amphitheatrum quoddam (Breslau, 1859, p. 360,)."

3 Curiously enough, the Irish spelling of "pound" is "punt." It is said that the word is derived from a Gaelic word meaning "a golden ox," which was the standard of value in Ireland until the 16th century."

The writers who adopt this view are far from being unanimous as to details. But there seems to be enough to render it more than probably that, at an intermediate stage between the vera solidus vis of ancient times and the vis civilis et festuaria which Gellius and others have spoken of, there was a promise to be fulfilled by the gods, by the recitation of solemn oaths by the parties, in the manner and with the consequences that have been indicated. That in time it should have dropped out of the ritual is quite in the order of things. This was simply another instance of the tendency to avoid unnecessary litigation. The restraining influence of the dread of forfeiture of the sacramental cattle, sheep or money that would follow a verdict that an oath had been unjust. And it must have been felt besides that it was unfair to brand a man as a false-swearer, without his having been before known to be a man of God, whose oath had been perfectly honest. He that should suffer a penalty for his impudence in not having taken more care to ascertain his position, and for thus causing needless annoyance to others, was held to have been so guilty of improvidence to be expelled from heaven, and to have forfeited the deities to whom he had appealed. So the oath—the original sacramentum—disappeared, the name passing by a natural enough process to the money which had been deposited as security for the fulfillment of the oath. And this, if now ceased to be an offering in expiation by a false-swearer, and became a mere penalty (forfeited to the state) of rash litigation (poena temere litigiosa). So when praedae later took the place of actual deposits, they became bound as state debtors for the sacramentum.

It may well be assumed that in most cases the finding of the court as to the justness or unjustness of the respective sacraments of the parties was the end of the case—that it was at once accepted and loyally given effect to. In favour of the party to whom interment had been granted, the oath might, as a matter of course, be a sufficient penalty; he retained the object in dispute with the fruits and profits he had drawn in the interval between litis contestatio and judgment. If, however, the finding was for the other party, and in his favour, the case was immediately referred back to court for a new trial. This procedure was followed. Gaius says that in awarding interment possession (vendicas dicere) the praetor required the grante to give security by sureties (praedae) to his adversary for restitution to the latter of what he had been awarded in the case of the party to whom judgment was granted. Table XII. Tables, which, according to Mommsen's rendering, declared that, when it turned out that interment possession had been awarded to the wrong party, it was to be in such party's power to demand the restoration of the object of vindication and its fruits, and assess the damages due for non-restitution at double the amount. This provision seems to have been intended to afford the wrongful interposer possessio, a means of avoiding the apprehension and imprisonment which were the statutory consequences of failure to implement a judgment. It is probable that in this duplicated money payment came to be regarded as the satisfaction to which the creditor was entitled. If the money paid was judged to be insufficient, on which, no matter for what reason, he was unable to obtain the thing itself and its fruits from their interposer possessio; that consequently an arbitrum litis aequitandae, or reference to arbiters to decide whether the money paid was sufficient, would indicate that it was rendered necessary by the possibility that the party to whom the object of vindication was awarded to give to his opponent the sureties (praedae et vindicularia) to whom Gaius alludes. Another procedure in the sacramental action for vindication of land was applicable to every kind of manus which a man could claim to have over persons or things, though necessarily with variations more or less important in the ritual. But the sacramental action was also used for vindication of claims in personam. As regards personal actions the ordinarily received opinion, which rests, however, on slender foundations, is that from the first the parties met on equal terms; that, if it was a case of money debt, the creditor commenced the proceedings with the party who was the master of the case in question,—"I say that you ought to pay me (dare opertores) tooo asses"; that this was met with a denial; and that a sacramental challenge followed on either side. All are agreed that the remit was to a single jude after an interval of thirty days from the proceeding had begun. If the defendant did not meet the remit the plaintiff had to establish his case to the letter; and that his sacramentum was necessarily declared unjust if he failed to prove his claim by a single penny. But there is considerable diversity of opinion as to whether by this form of process a claim of uncertain amount
could be insisted on—as, for example, for damages for breach of a warranty of acreage of lands sold, or of their freedom from burdens. If it could, then probably the question raised and dealt with in this case was the abstract one of liability—Was the warranty given, and has it failed?—the sum due in respect of the breach being left to be dealt with in a subsequent arbitral process (arbitrum iutae aetemandae).

The Legis Actio per Judicis Postulationem.1—The defects of the Verona MS. have deprived us of Gaius's account of this leges actio. There is little elsewhere that can with any certainty be said to bear upon it. The most important note is in Valerius Probus—T. P. J. A. V. P. V. D., which is generally interpreted—te, praeor, judicem arbitrum postulo postulo uti des. This petition to the magistrate to appoint a judge, arbiter or arbiti (as the case might be) in all probability was part of the procedure in the action, and that from which it derived its distinctive name. But the cause is conjectural, alike as to the nature and form of the action and the cases to which it was applicable. Gaius says of the leges actio sacramento that it was general, and that it was the procedure that was to be resorted to when no other was prescribed by statute. There are, however, nowhere indications of an express instruction that proceedings in any particular case were to be per judicis postulationem.

While it is impossible with certainty to trace the history of this procedure to its first beginnings, yet the impression is general that it must have originated in the regal period. It is commonly held that it is derived from the personal power of the praetor. It was therefore exercisable by any tribune as directed by the XII. Tables. Some eminent writers hold that it was employed in certain actions in which equitable considerations were allowed to be taken into account by the judex iusque judiciis, and generally jurgia as contrasted with tales. But this theory has many difficulties to contend with. It has no support from any ancient writer, and it leads to the result that the courts by legis actiones had power to take into consideration questions of bona fides, which is in contradiction with what Gaius says (iv. 11), but inconsistent with his character.2

The Legis Actio per Condictio.3—This, the youngest "action of the law," was introduced, Gaius says, by the Silian law as a means of recovering a liquid money debt (certa pecunia), and afterwards made available by the Calpurnian law to enforce personal claims (as distinguished from real rights) for anything else definite and certain (omnis res certa), and in both its forms, therefore, essentially an action of contract. The date of both enactments of this recovery, although there is no question that the Silian was the earlier. Gaius says of it that its purpose was far from obvious, as there was no difficulty in recovering money either by a sacramental action or one per judicis postulationem. But it is probable, as above stated, that money due under a novel contract was recoverable by neither of these processes, but by the much more summary one of manus injectio, a procedure which would be practically put an end to by the Poetilian law of 326 B.C. We are disposed to regard the lex Silia and the new procedure it authorized as a result of the change made by this last-mentioned statute. To have put off a creditor for money lent either with a sacramental action or one per judicis postulationem, would have been to deprive him of the advantages of manus injectio to a greater extent than was called for. At any rate, it seems to have been provided by the Silian law that, when a man disputed his liability for what was called pecunia certa, and forced his creditor to litigate, the plaintiff was entitled, if he pleased, to require from him an engagement to pay one-third more by way of penalty in the event of judgment being against him, while the soi-disant creditor had similarly to undertake to pay the penalty the same amount in case of judgment in favour of the alleged debtor. Those engagements (sponso et restitupio tertie partis) were not allowed in every case in which a definite sum of money was claimed per condiciionem, but only when it was technically pecunia credita. In Cicero's time creditum might arise either from loan, stipulation or literal contract (expensilia); but the last dated probably at so soonest from the beginning of the 6th century, and stipulation apparently was a result of the Silian law itself, so that the pecunia credita of this enactment can have referred only to borrowed money. The same phrase, according to Livy, was employed in the Poetilian law; it was thereby enacted, he says, that for pecunia credita the goods, not the body of the debtor, ought to be taken in execution. A connexion, therefore, between the Poetilian law and the introduction of the legis actio per condiciionem on the other, can hardly be ignored, and raises a probability that the latter statute was a consequence of the former, and was passed immediately or soon after the year 326 B.C. In the action on the Calpurnian law, it is probable that there was no penalty of a third part on either side. A peculiarity of the legis actio per condiciionem is that the plaintiff could at the be the praetor's command so to oblige himself towards the other, judgment was at once pronounced in favour of the latter without any resort to a judex. How the issue was adjusted when the pecunia and restitutio were duly given we are not informed, but, judging by analogy from the procedure in an action for breach of interdict under the formular system, and on the broader ground that that the plaintiff in the latter case had a right to a summary judgment, to have his reparation immediately, it would appear likely that the judge could determine whether or not the aversament was established, and, in certain cases, that non-delivery was due to the fault of the defendant; the plaintiff, however, was bound to make his aversament good to the last man of his claim. In the event of the plaintiff being successful in an action for certa pecunia, but delay was made by the defendant in satisfying the judgment, execution followed in ordinary form. How the matter was arranged in an action on the Calpurnian law for pecunia and restitutio is likewise not clear. It is said that the defendant was given such delivery or damages, and by some the opinion is entertained that he formulated his claim alternatively. Of this there is no evidence; and Gaius's statement that under the system of the legis actiones the judgment was immediate, and that specific thing sued for, leads to the assumption that a judgment for the plaintiff, on which specific implementation failed, must have been followed by an arbitrum iutae aetemandae for assessment of the damages in money, and that execution proceeded thereon as if the judgment had been for a sum of money in the first instance. The general opinion, however, is that the judge to whom the issue was remitted

2 To the literature p. 548, note 1, add Becker, Aktionen, vol. i. cap. ii.; Voigt, Jus naturel, &c, d. Körner (Leipzig, 1856-75); vol. iii. §§ 98, 99; Baron, Die Condictio nemen (Berlin, 1881), §§ 15, 16; Jobbé-Duval, Procedure Civile (1896), i. 61 sqq.
assessed the damages himself and as a matter of course—that the instruction to him was quinis res erit, tantum pecuniam condemnato.

The Legis Actio per Manus Injunctiōninem. — This “action of the law” was ordinarily employed as a means of execution against the body of a judgment-debtor or one who had confessed liability in the first stage of a process. But, in certain cases, it is conjectured, it was thought proper that a creditor should have a more summary remedy than was afforded by a sacramental act or one per judicis postulationem, and he was allowed to apprehend his debtor without any antecedent judgment or confession; in which cases, if the debtor disputed liability, the question could be tried only in proceedings at his instance, or sometimes at that of a third party on his behalf, for a stay of execution. It will simplify matters, however, to confine our attention to it in the meantime as a means of execution against the body of a judgment-debtor.

Gaius's description of it is very general; for details we are indebted principally to the Noces Atticæ of Aulus Gellius, in an account which he gives (put into the mouth of Caecilius Africanus, a well-known jurist of about the same time as Gaius, and a contemporary of his own) of the provisions of the XII. Tables in reference to it. Africanus is made to say that according to his belief (opiner) the words of the statute were these: "For admitted money debts and in cases that have been regularly determined by judgment (aeris consenti robuquius jure judiciis) there shall be thirty days' grace. After that there may be manus injectio; apprehending a creditor shall then bring his debtor before the magistrates, who shall still fail to satisfy the judgment, and no vindex come forward to relieve him, his creditor may carry him home and put him in chains. He may live at his own cost; if not, his creditor must give daily a pound of salt, or more if he please." Africanus continues narratio: There was still room for the parties to come to terms; but, if they did not, the debtor was kept in chains for sixty days. Towards the end of that time he was brought before the praetor in the comitium on three consecutive market-days, and the amount of the judgment-debt proclaimed on each occasion. After the third proclamation capite poenas dabo! — what these words mean will be considered in the sequel— or else he was sent across the Tiber to be sold to a foreigner. And this capital penalty, sanctioned in the hope of deterring men from unfaithfulness to their engagements, was one to be dreaded because of its atrocity and of the new terrors with which the decemvirs thought proper to invest it. For, if it was to more creditors than one that the debtor had been adjudged, they might, if they pleased, cut up and divide his body. Here are the words of the statute—Tertii nudinis partis secondo. Si plus minusse sucerent, se frusto est:"

Such is Gellius's account of the provisions of the XII. Tables in reference to this legi actio, and he is to a considerable extent corroborated by Quintilian, Tertullian, and Dio Cassius. But it is not in the mind that he does not vouch for its accuracy; the Tables were already in his time matter of antiquity, and even the tables that he knew (1550), ii. 396 seq.: Hoffmann, Text und Satzwerk, 2nd ed. (1850), p. 54 seq.; Vainberg, Le nexo et la contrainte par corps en droit Rom., (Paris, 1874), pp. 56 seq.; Voigt, XII. Tafeln, vol. i. §§ 63-65; Jhering, Introduction p. 548; pp. 196 seq., 232 seq.; Cog. Institutiones jurisdictiœ, 2nd ed. (1850), 141 seq.; Schlossmann, Altorömische Schuldesrecht (1904); Kleinleidma, Personale xekution der XII. Tafeln (1904).

In his Historical Introduction, 2nd ed. pp. 192-193, Mainheid maintains that the "aeris consenti" of the Tables refers to sexual

creditor himself,—in its first stage, at least, an act of pure self-help. The debtor had at once to be brought before the magistrate, in order that his creditor might solemnly go through the required formalities before he could carry him away and provisionally confine him in the domestic lock-up. It was this appearance before the magistrate that made it a legal act. In a course, however, was avoided either by (1) instant payment or other implement of the judgment or arrangement with the creditor, or (2) by the inter- vention of a vindex or champion. The position taken by the latter was that either of a surety or of an attorney for the judicatus demanding a rehearing of the case: he appeared rather as a con- traverter in his own name of the right of the creditor to proceed further with his execution, on the ground that the judgment was thereby made good. This was, however, in the manner described in the text, the creditor, in which the former was plaintiff, but to which the debtor was not a party. If it failed, then the vindex was called to give double the amount of the original debt, as a penalty on him for having improperly interfered with the course of justice; his inter- venion was regulated as a defect, but on payment he had provisionally relief against the original debtor who had been liberate through his intervention. Failing a vindex and failing payment, the creditor took his debtor home and incarcerated him, dealing with him for the days' grace. If, however, without any arrangement, there was a magisterial decree (addictio) awarding the debtor to his creditor.

What right did this addictio confer upon the creditor? The description of it in the Tertullian and Gellius gives different meanings: as meaning that his creditor might put him to death, the alternat- is to bring his sale as a slave beyond the Tiber. There is, however, a diversity of opinion among the modern writers as to the true meaning of these words. While some hold, and rightly it is thought, that the Gellian interpretation is genuine, and that in the addictio it is objected to by Muirhead in the ground, inter alia, of its incredible severity in the case of petty debtors. He holds that capite poenas dabo! meant simply that the debtor "paid the penalty of his body," in other words, he was to be delivered thus merely used in opposition to bona. Even more numerous are the writers who object to Gellius's statement that the body of the addictio when killed might be cut in pieces where there were several creditors; they hold, and this is right also, that the Tables referred not to the body but to the belongings of the debtor,—that when there were concurrent creditors they shared his familia amongst them. But these views are, it is thought, somewhat inadequately supported. The estates referred to in the addictio as being liable for the repayment of the debt are the family, slavery or deprivation of citizenship; there is nothing more astonish- ing in a creditor's right to kill his debtor than in a father's right to kill his child; and comparative law gives many instances, of a parallel kind, of the harshness of primitive law to defaulting debtors.

The addiction was probably a relic of earlier times, and Gellius admits that he never heard or read of a dissection having taken place.

The cruelties and indignities to which creditors subjected both their judgment and naked debtors led, as above noticed, to many a commotion in the first two centuries of the Republic. The latter were probably much more numerous than the judicati, and, being in great part the victims of innocent misfortune, it was the sufferers they endured at the hands of relentless creditors that so often roused the sympathies and indignation of the populace. But the judgment-debtors had suffered along with them; and some of the provisions of the Poetelian law of 326 B.C., already mentioned, were meant to protect the former against the needless and unjustifiable severity that had characterized their treatment by their creditors. The manus injectio itself was not abolished, nor the possible intervention of a vindex; neither were the domum ductio that followed, and the provisional imprisonment with the light chains, authorized by the Tables while it lasted; nor apparently was the formal addictio of the debtor to his creditor when the sixty days had expired without arrangement. But after addiction, if it was for nothing more than civil debt, there were to be no more dungeons and stripes, fetters and foot-blocks; the creditor was to treat his debtor and his industry as a source of profit that would in time diminish and possibly extinguish his indebted- ness, rather than as an object upon which he might perpetrate any cruelty by way of punishment. Although the edict of P. Rutulius of 107 B.C. provided a creditor with machinery for debtors, but this view has, it is thought, insurmountable objections to overcome.

2 For a fuller explanation, see Muirhead, Hist. Introduction, 2nd ed. pp. 198 seq., and authorities there cited. See also Kleinleidma, Personale xekution, pp. 235 seq. Lenel must be added to those writers who think that "partis secondo," & c., refers to the goods of the debtor (Zeitschr. d. Sav. Stift. xxvi. pgs. 507-509).
attaching the estate of his debtor, he had still the alternative of incarceration. This might be avoided under the Julian law of *cessio bonorum* by the debtor's making a complete surrender of his goods to his creditor; but, failing such surrender, incarceration continued to be resorted to even under the legislation of Justinian. During the Empire, of course, it was not by *manus injetio* that the incarceration was affected; for it went out of use with the definitive establishment of the formalistic system of procedure.

It was as directed against judgment and nesal debts that *manus injetio* was of most importance and chiefly made its mark in history. But there were other cases in which it was resorted to under special statutory authority, where a remedy seemed advisable more sharp and summary than that by ordinary action. In some of these cases the word spoken of as *manus injetio pro judicato* (i.e. and upon a judgment), in others as simple *manus injetio* (*manus injetio* *pura*). In the first the arrestee was not allowed to dispute his alleged indebtedness in person; he could do so only through a vinden, and if no one intervened for him in that character he was carried off and dealt with by his arresting creditor as if a judgment had been obtained against him. In the second he was not required to find a vinden, but might himself dispute the verity of the charge made against him. In either event, it is plain (though it is disputed), of a duplication of his liability if he failed in his contention. By a *lex Vallia*, in the latter half of the 6th century of the city, this *manus injetio* *pura* was substituted for *pro judicato* in all cases where the fact of the debt, and not the judgment nor so-called *depensum*, i.e., payment by a surety or other party on account of the true debtor, who failed to relieve the former within six months of such payment.1

The *Legis Actio per Pignoros Capionem*.—In the ritual of the *actio sacramenti* the *vis civilis et festucaria* was a reminiscence of the *vex solida vis* with which men settled their disputes about property in the earliest infancy of the commonwealth. *Manus injetio* was a survival from times when the wronged was held entitled to lay hands upon the wrongdoer, and himself subject him to punishment; custom and legislation interposed merely to regulate the conditions and mode of exercise of what essentially was still self-help. In *pignoris capio* self-help was likewise the dominant idea. It may be fairly enough described by the English legal term distress—the taking by one of property belonging to another in satisfaction of an obligation or in security for a debt due by the latter, which the former had failed to pay. The seizure, however, did not proceed upon any judgment, nor did it require the warrant of a magistrate; it might be resorted to even in the absence of the debtor, and on a *dies nefastus*; but it required to be accompanied by certain words of style, spoken probably in the presence of witnesses. It was only in a few exceptional cases that it was competent, in some by force of custom, in others by statute, nearly all of which seem to be given by Gaius,2 and all of them being of a military, religious or fiscal character. What was the procedure, and what its effects, are far from certain. Jhering, founding on some expressions of Cicero's, conjectures that, whether the debt was disputed or not, the distrainer could neither destroy nor sell nor definitely appropriate his *pignus* without magisterial authority;—that in every case he was bound to institute proceedings in justification of his capio, and to take in them the position of plaintiff. The idea is ingenious, and puts the *pignoris capio* in a new and interesting light. There is no question of right for whose judicial arbitration no other process of law was open,—with the additional advantage that it secured instant satisfaction to the raiser of it in the event of the question being determined in his favour. If against him, the inevitable result, in substance at least, must have been a judgment that he had no right to retain his pledge, with probably a finding that he was further liable to its owner in the value of it, as a punishment for his precipitancy.3

Procedure outside leges actio.

1 *On manus injetio pro judicato and pura*, see Gaius, iv. 22-23.
it certainly did not disappear.—witness the famous case in which Cicero made, before them the oration of which he was so proud, Pro domo sua. The action of the consuls and afterwards of the censors as guardians of public morals, and the social and political disabilities arising from the generality of which they visited persons who had been guilty of perjury or gross perfidy, did not fail to foster fidelity to engagements. Through the same agency the exercise of a variety of rights whose abuse could not be made manifest at once the husband and the father of his children—was controlled and kept within bounds. It was not on light grounds, indeed, that the majesty of the pater-familias within the household could be called in question; it was only when he forgot that in the exercise of serious domicile within his family he was bound to act judicially. For he also was a judge—judget domesticus, as he is often called, though in all cases of gravity he was required to invoke the advice of his kinsfolk in a family council. On him lay the duty of controlling his family; if he failed to do so he was himself in danger of censorial animadversion.1

Between citizens and foreigners with whom Rome was in alliance by a treaty (tempora perpetua) conferring reciprocal rights. Reciprocating, the proceedings took the form known as recipercatio or recuperatio.2 The action was probably always raised in the forum contractus. According to the common opinion the magistrate ordinarily presiding there heard what parties had to say in pleading and defence, and then put into a simple formula the points of fact arising on them, authorizing the recuperators to whom the matter was remitted to find for plaintiff or defendant according to circumstances. The recuperators were usually three; sometimes four, sometimes five or six, and sometimes more, but always in odd number; but whether the nationality of both parties required to be represented we are not told. Expedition being in most cases a matter of importance, recuperators were required to be given a written mandate and to act in their own houses. The action was usually limited to ten. How execution proceeded upon it, if it were for the plaintiff, does not clearly appear; Voigt, founding on a few words in Festus, concludes it must have been by something like the lucrinusclasspath. This recuperatory procedure in time came to be resorted to in processes de libertate and even in some litigations where both parties were citizens. There are numerous instances of the latter in Cicero; and it is remarkable that in the praetor's form of the ultima delicta the remit was usually not to a judge but to recuperators. The explanation may be in the comparative summariness of the remedy.

III. The Jus Gentium and Jus Honorarium

(Latter half of the Republic.)

1. Influences that operated on the Law.

Growth of Commerce and Influx of Foreigners.—While it may be admitted that commerce was beginning to take root in Influx of foreigners.

Rome in the 1st century, yet it was not until the 6th that it really became of importance. The campaign in which Rome was engaged until the end of the First Punic War absorbed all its energies. But after that time the influx of strangers, and their settlement in the city for purposes of trade, became very rapid—not only of Latinos and other allies, but Greeks, Carthaginians and Asians. To them and the regulation of their affairs the jus civilis—the law peculiar to Rome and its citizens—was applicable only if they were members of allied states to which commercium and recuperatio were guaranteed by treaty. But many were not in this favoured position; and even those who were soon found the range of Roman modes of acquiring property and contracting obligations too narrow for their requirements. Hence a jus gentium was gradually developed 3 which very early in its history drove treaty covenants for recuperatio out of use; its application may for a time have been limited to transactions between non-citizens or between citizens and non-citizens, but it was eventually accepted in the dealings of citizens inter se and became part and parcel of the jus Romorum. Gaius and Justinian speak of it as "the common law of mankind," 4 the law in use among all nations; 5 but the language must not be taken too literally. The Roman jus gentium was not built up by the adoption of one doctrine or institution after another that was found to be generally current elsewhere. In the earliest stages of its recognition it was an independent international private law, which, as such, regulated intercourse between peregrins or between peregrins and citizens on the basis of their common libertas; 6 during the Republic it was purely empirical and free from the influence of scientific theory, but its extensions in the early Empire were a creation of the jurists—a combination of comparative jurisprudence and rational speculation. To say that it was de facto in observance everywhere is inaccurate; on the contrary, it was Roman law, built up by Roman jurists, though called into existence through the necessities of intercourse with and among non-Romans.

It may be a little difficult for a modern jurist to say with perfect precision what were the doctrines and institutions of the jus gentium as distinguished from the jus civilis. But the distinction was quite familiar to the Romans, as witness, for example, the statement of Marcian, in reference to the δικαίωμα, that they enjoyed all the rights competent to a man under the law, but none of those competent to him under the latter.

Institution of the Peregriνus Praetor.—The praetorship, 4 as already mentioned, was an outcome of the Licinian laws of the year 367 B.C. (see Praetor). Down to the end of the 5th century of the city the praetor so appointed superintended single-handed the administration of justice, alike between citizens and foreigners. But with the altered condition of things in the beginning of the 6th century, and the influx of strangers which has already been alluded to, the work seems to have been found too onerous for a single magistrate, and a second praetor was created. The date is generally assumed to have been about the year 242 B.C.; Pomponius says distinctly that the new office was created necessary by the increase of the peregrin population of Rome, and that the new magistrate got the name of praetor peregrinorum because his principal duty was to dispense justice to this foreign element. After the submission of Sicily and Sardinia the number of the praetors was increased to four and after the conquest of Spain to six; Sulla raised the number to eight; and Caesar eventually to sixteen. But all the later creations were for special purposes; the ordinary administration of justice within the city with the representatives for the time of the two earliest, who came to be usually distinguished as praetor qui inter cives jus dicit (or urbanus) and praetor qui inter cives et peregrinos jus dicit (or peregrinus). It would be going too far to speak of the latter as the principal author of the jus gentium; for a large proportion of the actions for enforcing jus gentium rights were civil, not honorary—a fact which proves that the rights they were meant to protect and enforce had their origin in the jus civilis, although moulded to new requirements by tacit consent or by the agency of the jurists. But even in this view the peregrin praetor must have had a powerful influence in giving shape and consistency to the rising jurisprudence, by means of the formulae he adjusted for giving it practical effect.

Simplification of Procedure and Introduction of New Remedies under the Aebulian Law.—The lex Aebutia is only twice mentioned by ancient writers (once by Aulus Gellius and once by Gaius), but still now new remedies are derived from it.

Reforms of Aebulian law.

1 On Jus domesticum, see Greenidge, Legal Procedure in Cicero's Time, pp. 376 seq.
2 Voigt, Proc. recuperatio der Römer (Brunswick, 1837); Huschke (rev. Sell), in Richter's Krit. Jahrbücher, i. (1837), 868—911; Voigt, Jus naturale, &c., ii. §§ 28—32; Karlowa, Rom. Civilprocess, pp. 218—250; Girard, Organisation judiciaire des romains, i. 97 seq.
4 Voigt, Jus nat. ii. 661. He distinguishes the jus civile, jus gentium and jus naturale as the systems which applied respectively to the citizen, the freeman and the man.
5 See Labatut, Histoire de la Préturie (Paris, 1868); Mommsen, Staatsrecht, ii. 176 seq.; Karlowa, Rom. Rechtsgeschichte, i. 217 seq.; Girard, Organisation judiciaire, i. 160 seq., and on the peregrin praetorship in particular, pp. 206 seq.
the statutory instrument whereby the formular system of procedure was substituted for that per legis actions. Its date was probably about the end of the 6th or beginning of the 7th century of the city. Girard, who has examined the question with great care, places it in the first third of the 7th century; and, though his reasoning is not quite conclusive, it largely refutes the arguments of older writers, who in many cases put the date a century or more earlier. It is the opinion of Wlasak that it was a piece of tentative legislation, and that they are, in fact, the work of recognized authors. This, it has been argued, is the law but merely made the formular procedure alternative to them, according as the praetor, on the representation of the parties, might determine in each case; formular, in his view, being first made compulsory, subject to a few exceptions, by the Julian laws. This principle, however, is not entirely correct, because the formular procedure was supposed to be an innovation, and it seems based on reasoning which cannot be gainsaid, that even prior to the lex Aebutia written formulae were employed in practice, particularly if not exclusively in the peregrin praetor's court, and that one of the objects of the statute was to regulate similar procedure in civil actions. All such formulae granted by the courts must of course have been in factum conceptum. Unless we hold this view it is difficult to see by what means the rights and obligations of peregrins in their transactions inter se or with citizens could have been ascertained or enforced. This, it seems, is the whole of the system which it is held that the praetor under the jus gentium, whose rules would probably be strange to them, and their instructions would therefore have to be precise and definite. It would have led to miscarriages of justice. From the results of this study we can see how the peregrini came to be regarded as the primary organ in developing the jus gentium. But there is some reason for holding that the praetor also ruled before the Aebutian law, occasionally exercised his imperial by granting actions to and from whom the jure actions were rare, if, in exceptional cases where by treaty they enjoyed jura commercii, were not open to them. Written instructions to the recuperators or other judges for trying suits in which a praetor would be a party to the cause of action, and the praetors themselves had to decide cases, also shows several apparent anomalies in the later law, for which no other good explanation can be found, as, for instance, the fact that in deposit and commutate actions in factum as well as in jus might be right. It was probably for enforcing a contract of fiducia in this way be explained. The authorities who are to throw light upon the development of some of the bonae fidei contracts.

Provincial Conquests—The growth of commerce and the enormous increase of wealth, which made great capitalists and enabled them through the agency of freedmen and slaves to carry on trade on a scale hitherto unknown, and which thus helped to foster the jus gentium, were no doubt due to a large extent to pro-

vileges to the provinces. But the officials who proceeded to the conquerors provinces as governors found themselves face to face with laws and institutions in many respects differing from those of Rome. Political considerations dictated how far these were to be respected, how far subverted. In some provinces, more especially the Eastern ones, it was thought unnecessary to do more than supplement the existing system by the importation of doctrines of the jus gentium and the procedure of the praetor's edicts; while in others, in which it was deemed expedient to destroy as far as it possibly was able national autonomy and every national rallying point, a Romanization of all their institutions was resorted to, even to the extent of introducing some of the transcriptions which previously had been confined to citizens. But in either case, in order to adapt his law to the provinces, deriving from them an empyrean tenure of land, its hypooch, its Rhodian law of general average and a variety of other features that were altogether foreign. They were accustomed to tacit recognition, by edicts of the praetors and in other ways; but, in whatever way received, they were indirectly fruits of provincial conquest.

Spread of Literature and Philosophy—The effect of Roman civilization on the education of educated men in the later Republic literature and philosophy is a matter for consideration in connexion with Rome's general history. It is not proposed to consider here the question how far specific works of art—of literature, or philosophy, or the like—entered into the formation of the schools, especially that of the Stoics; it is a subject much too large to be disposed of in a few lines. The matter is mentioned simply for the sake of noting that the spirit of the age was in a different way than Rome's. The study, seriously and conscientiously undertaken, greatly to promote a new departure in jurisprudence that came very marked in the time of Cicero—the spirit of the age to subordinate form to substance, the formation of the abstract to the individual case to which it was proposed to apply it. This was the first effort of what then was called an equity to temper and keep within the bounds the rigour of the jus strictum. The praetors, the judges and the jurisconsults all had some knowledge of the spirit of prae- 

...
property of their own. With increasing luxury and licentiousness divorce became common.1

This looseness of the marriage bond, as was naturally to be expected, had its effect on the other family relations. The right of children to take their father's inheritance began to be lightly esteemed. The law—or rather the interpretation put upon the uti legassit of the XII. Tables—had empowered him testamentarily to disinherit them, or in instituting them to limit their right to a mere fraction of the inheritance; but it was assumed that this power would be exercised with discretion and only when justified by circumstances. But in the later days of the Republic, amid the slackened ties of domestic life, paternal as well as conjugal duty seems to have often been lost sight of, and children were disinherited or cut off with a nominal share of the inheritance in order that a stranger might be enriched. This led to the recognition by the centumviral court, without apparently any legislative enactment or praetor's edict to warrant it, of what was called the querela inofficii testamenti—a challenge of a testament by a child whose natural claims had been capriciously and causelessly disregarded. While the practice may for a time have been hesitating and uncertain, yet early in the empire, through means of this querela, the rule came to be established that every child was entitled, notwithstanding the terms of his father's testament, to at least a fourth (portio legitima, quarta legitima)2 of what would have come to him had his parent died intestate, unless it appeared that the latter had had adequate grounds for excluding him or limiting him to a smaller share. A parent might in like manner challenge an undutiful testament made by his child to his prejudice; and ultimately in certain cases so might brothers and sisters inter se.

The decline of morals had an equally marked effect on the transactions of daily life, calling for precautions and remedies that had not been found requisite in the hey-day of the virtues of Roman. Rulin men no longer relied on each other's good faith unless backed by stipulations, securities (cautio) and guarantees. The Rutulian bankruptcy arrangements and the actio Pauliana for setting aside alienations in fraud of creditors indicate a laxity in mercantile dealings that was perhaps an inevitable consequence of the growth of trade and commerce. But, that such remedies as, for example, the exception rei venditae et traditae or the exception non numerarum pecuniae should have been found necessary—the one an answer to a vendor (with the price in his pocket) who attempted to dispose his vendee because of some of the formalities of conveyance had been neglected, the other an answer to an action on a bond for repayment of money that by some accident had never been advanced—proves that the law had now to encounter fraud in all directions, and that Graeco fides had to a great extent displaced the old Roman probity.

ii. Factors of the Law.
Legislation.—It cannot be said that during the period of nearly two centuries and a half embraced within the present epoch the private law owed much to legislation. The vast majority of the enactments of the time referred to by the historians dealt with stipulations, securities (cautio), and guarantees, which the interests and conscience or of the two comitia of the tribes, to which ordinary legislation had passed as

1. Voigt, *Die Lex Maenia de dote* (Weimar, 1886), attributes to a *Lex Maenia* of 168 B.C. the creation of the judicialis de moribus which superseded the family council as a divorce court providing for a penal action on divorce. The existence, however, of a statute for this purpose has not been proved, and is discredited by most recent writers. See Czyzharz, *Die Römische Duldrecht* (Giessen, 1870).

2. From this the legitimacy of children recognized by most continental countries nowadays is derived.

Edicts of the Magistrates.3—The practice of propagating edicts was very ancient, and had been fostered by kings and consuls long before the institution of the praetor. It was one of the most obvious ways of exercising the imperium with which the supreme magistrate was invested—to lay an injunction upon a citizen and enforce his obedience, or to alter and govern him without going through the forms of law. It was one of the ways in which public order was protected where there had been no invasion of what the law regarded as a right, and where, consequently, there was no remedy by action. That the practice of the edict was continued to this day is something of which one may be under no necessity to say, with reference to particular cases, and what afterwards came to be called edicta repentina or prout res incidit posita—there is little reason to doubt. In time a new class of edicts appeared which got the name of edicta perpetua (or perpetuae legiones causa processione) or the name of edicta praetoria (edicta praetoriae sanc- tionis [as the white boards displayed for the purpose in the forum were called], of the remedy he would be prepared to grant on the application of any one alleging that the state of facts contemplated had arisen. The edict, if granted, could be considered as an innovation of the praetor which could not be undone or taken away; but it was usual for him to do so if they had been found beneficial in practice, he adding to them new provisions suggested by demands made upon post praetors for edicta repentina, but which had been general only. Edicts of some remony entirely of his own devising. As each new praetor entered upon office he announced his jurisdictional programme—his lex annua, as it was called from this particular point of view, by far the most important part of it. It treated of the new legislation, and only a few paragraphs, diminishing in number as time progressed, representing his own contribution. And so it went on in the first years of the Empire, and the praetor function was regarded as the impervious to the legislation of Hadrian, been subjected to revision, and consolidated along with the Aedilian Edicts, by Salvius Julianus, it was, as will be noticed below, sanctioned as binding on the whole Empire. The Edict was applied both to the single edicts and to the whole body of them together.

There is some reason for supposing that the edict attained considerable proportions in the time of Cicero; for he mentions that, whilst in his youth he had been unable to procure a seat for the boys in his school, in later years these were neglected, and young men directed instead to the praetor's edicts for their first lessons in law. Of a few of them the date and authorship are known with tolerable precision, but of the history of the majority, including some of the most important, such as those introducing restitution in integro on the ground of loss through error, absence, minority and the like, and those revolutionizing the law of succession, we are to a great extent in the dark. It was one of the great advantages the they had never legislated in a way that might be thought not to have been impossibility had its provisions from the first been as stereotyped as they became by the consolidation in the time of Hadrian.

The edict seems to have contained two parts—the first what might be called the edics proper, and the second, the so-called Edicts. The Edicta partners to the law, that was, the praetor, to whom the latter was independent of the others, in the sense of being able to resign, withdraw or to have his office dropped, his powers thereby being wholly surrendered, whether derived from the jus civilis or from the jus praetorium. The styles or formulae for civil actions were published without any corresponding edict; for praetorian actions styles were published according to the laws, and not independent formulaes for interdicts, processual stipulations, &c. The contents of the edicts proper were in detail very various, but all devoted to an exposition of the ways in which the praetor meant to exert his jurisdiction during his year of office. They may be divided into five classes, viz., the didactic or dogmatic formulations of the law, but rather announcements of what remedy he would grant in such and such circumstances, or direct orders to do or prohibit doing certain things.

At the same time an edict might be so worded as to have any of them did so not of right, as he would have done had his edicts had a statutory or customary foundation, but of grace—on the strength of the praetor's promise to grant him what he claimed and make the grant effectual. That was why originally such an act of the praetor's year of office—a rule which in time, by abuse, was converted into the somewhat different one that a purely praetorian action (i.e. not originally of the jus civilis) had to be raised within a year of the concurrence to which it was annexed.

As already observed, the praetor's edicts proceeded upon lines of equity; that is to say, they were directed against the strictness and formalism of the jurisprudence of the XII. Tables. Such may be said to have been the general tendency of the praetor's edicts as whole.

But it was the tendency of the whole jurisprudence of the time, and by no means peculiar to the praetorian creation. Nowhere in the texts are the praetors spoken of as the mouthpieces of equity as distinguished from law. Such a distinction recurs frequently in Cicero. And Cicero, while writing with the eye fixed on the praetors and their letter, and jus with its letter, it is but in order to sing the praises not of the praetors but of the pleaders who maintained the former as against the latter, and of the judges who were persuaded by their arguments. What was lost in the edict of the praetor was more than ever made up in the arguments, as we shall have been embodied in statute, and we know that in time statute came to its aid; witness a very remarkable provision of it—

"I will give bonorum possessio as may be enjoined by statute, without a consideration of the case contained in the edict."

Of the edicts of the peregrin praetor and their relation to that of his urban colleague little is known. That they differed in some respects there can be no doubt, for in the lex Rubria (49 B.C.) settling the government of Caislina the magistrates are directed, when acting praetor, to consult the edict of the urban praetor, as way prescribed in the edict of the peregrin praetor. The latter, therefore, must to some extent have been in advance of that of the urban praetor, probably in this respect, that, being prepared primarily for purposes of the national administration, more or less, there was more than the other avoided formalities that were competent only to citizens, and thus to a greater extent simplified procedure.

The edicts of the provincial governors must have varied according to the conditions and needs of the provinces, being, therefore, more contradictory and more fragmentary, and the more so as a matter of course, as the provinces were gradually prolonged in number and extent.

The praetor's edict was the law in respect of cases not regulated by existing law. He was the lawgiver, constrained, therefore, by the necessity of providing for latent duties, for the full extent of which could not be determined beforehand. The edict of Cato was made up, therefore, of what was to be enacted in accordance with current public opinion, which he had ample opportunity of gauging; it was the reflection of that general sentiment of right, which, phrase it how we may, is the real basis of all customary law.

It was formed in accordance with the principles of the dominant, however, and so in an action for establishing a right of property, a res nec conditum is applicable only if it appear that such a thing belongs to the plaintiff in quittance right, then, judge, whatever be its value for the plaintiff, in that condemn the defendant; should it appear otherwise, acquit him.

The primary duty of a judge on such a point was to determine what the title on which the plaintiff founded his pretensions gave him a right that came up to property; and it can hardly be disputed that it was by the decisions of a series of judges, in a series of cases, that the law of property was formed. The very right of property given by Justinian under technical names was gradually brought into view. Those decisions, whether upon the obligations of a vendor, direct or indirect, or upon the sufficiency of a title to property, or the recognition of the law of alienation, as it was called, had generally been based on the practice; the opinions of the jurists submitted to a judge (responsa prudentium) were invested with binding authority. During the Republic, if a judge deferred to them, it was simply because he regarded them as the principles upon which the public opinion was established. In a series of consistent judgments of such sorts built up was in the strictest sense a law based on casuist immediate and modern. The man who first drew, accepted and endorsed a bill of exchange did as much for the law as any lawgiver has ever done. They were not, however, the practice of giving advice to the public, or at least not in the form in which the advice of others was of such weight.

In Rome the process was sometimes wonderfully expedient; witness what Justinian narrates of the introduction and recognition of the Decree of the Ten Tables. The Perpetual Augustan Code was the product of the tribune, and was written after the law of the Twelve Tables.

The contract of sale, the contract of gift, the pawn, the pledge, the mortgage, the partnership in business, the division of inheritances, the division of testamentary statutes, contracts, wills, and various other deeds of a legal character, were all comments or shorter treatises on different branches of the law.

iii. Substantive Changes in the Law during the Period.

The Public Edict.—There were necessarily many changes during the period in the law of property and of minor rights, even in the continental countries, and even in Italy. The whole process of development was from this time onwards a series of jurists (jurisconsulti, jurisprudentes, juristes, jurists, juristes, juristes, juristes), who were always in the practice of giving advice in law in public adopted by Tib. and C. and others, available to clients (see Patron and Client), teaching, and the Public Edict. It was an independent collection of the law, the basis of which was the Roman law, of which the Public Edict was the definitive

1 There is some doubt whether the Jus Actianum mentioned by Pomponius (Dig. l. 1, 2, 3) was an independent collection of the law, the basis of which was the Roman law, of which the Public Edict was the definitive

3 See Rébére, Théorie de l' hon. habere ou de la propriété privilégiée (Paris, 1867); Huschke, Das Recht der Publicistischen Kniege (Stuttgart, 1871); Schuchl (rev. Huschke), in the Kreis VIerteljahrschrift, xiii. (1876), 562 seq.; Lenel, Beiträge zur Kunde d. praetorischen Edicts: I. Das Public. Ed. (Stuttgart, 1878); Appleton, Histoire de la propriété privilégiée (Paris, 1889);
as a fictitious ownership of either res mancipi or res nec mancipi, valid against all the world except the true dominus. The accounts we possess of this effect are somewhat inconsistent and even contradictory; the explanation may be that it went through a process of development, and that even if it may have had more than one section, without our always being able to say to which of them the criticism of a particular commentator is directed. There is no doubt of its general correctness, and the next is to correct and to explain of the way in which the correction was accomplished.

One of the defects was this: if a man had taken a transfer of a res mancipi from its rightful owner, but simply by tradition instead of by the exercise of dominium, he could not acquire dominium ex jure Quiritium, and the transferee remained undivested. The result was that the latter was in law entitled to raise a res venditio and oust the transferee if it was compromised in his favor. But a third party had obtained possession of the thing, but in such a way as not to be amenable to an interdict, the transferee could not effectual vindication against him, as he was not in a position to prove dominium ex jure Quiritium. The first difficulty which was overcome by the excepcion rei venditiae et traditae, also a praetorian remedy, and probably older than the Publician; to the transferee’s vindication on the strength of his unextinguished quiritary right the transferee pleased sale and delivery as an effectual praetorian defence. But, when a third party was in possession, and the transferee by simple delivery took the initiative, the position was more complicated. Such third party might be in perfect good faith; his prevention might be controlled by the doctrine that he was embarrassed by the formal conveyances which fortified his acquisition with a formal conveyance. But that was no sufficient reason in equity why he should be allowed to defeat the prior right of the original transferee, who, if he had possessed for the requisite period of time (before the limit set by the law (iusdictio) had almost of itself the same effect as if the legislature had directly enacted that in future delivery of a res mancipi in pursuance of a sale or other good cause would confer a right of ownership in it even before usucapion had been completed. Till completed, however, the transferee was not quititary owner: the thing in question was only in bonis, of his belongings, and the legal title, though an empty one—nudum jas Quiritium—remained in the transferee; it was only with this that the question of possession was concerned. Hence came the jure piano jure. The inevitable result of the recognition of this tenure in bonis was that mancipation came to be regarded in many cases as an unnecessary formality; and the marvel is that it continued to hold its ground at all. The explanation may be that it restored a form for and gave force of law to the tobae municipale (medieval tenancy) which accompanied the negotium per aures et libram; and, although many of these might quite well be thrown into the form of stipulations, yet there are others that it may have been thought salutar to leave to effect under the provisions of the earlier law.

The second case that was met by the Publician Edict—whether as originally published or by an amendment of it cannot be determined—was that of the bona fide transferee of a thing by purchase or other similar title who, having lost possession of it before usucapiion, found to his cost that the transferee had not been its owner, that no ownership therefore had been transmitted to him (the transferee), and that consequently he was not in a position to claim usucapion. It is therefore obvious that the Edictum

Domina

tium bonorum

tarum.

had been overruled.

For the different theories, see Girard, Textes, 3rd ed. pp. 137-38. What was the nature of the so-called actio Publiciana rescessoria in which completed usucapiion was feigned not to have taken place? The same, as already mentioned, in the second edition of his Edictum Perpetuum, p. 164, gives strong reasons for holding that there was from the beginning only one edict and one formula which was applied alike to bonitary ownership and to usucapion.

See Bekker, Aktionen, i. c. 5-8, and App. D, E, F and vol. ii. c. 15; 16; Voigt, Jus Naturale, &c., in. iii. §§ 106-24, and vol. iv. App. I. The third purpose of the usucapion, and the purpose of which the acts of the Publician law were intended to be a substitute for, was to give security against future claims of ownership, the usucapiion being of necessity an indefinite claim.

Such obligations—usually imposing the duty of restitution of unjustifiable gains—filled a considerable space in the practice and doctrine of the period, and early gave rise to a variety of brocards, e.g., Pothier, 1 c. 7, &c. Nemo damnum debet per lucrum alterius. &c.

Lenel, in the 1st ed. of his Edictum Perpetuum (p. 164) gives strong reasons for holding that there was from the beginning only one edict and one formula which was applied alike to bonitary ownership and to usucapion. But see above, pp. 567 seq. For the different theories, see Girard, Textes, 3rd ed. pp. 137-38. What was the nature of the so-called actio Publiciana rescessoria in which completed usucapion was feigned not to have taken place? The same, as already mentioned, in the second edition of his Edictum Perpetuum, p. 164, gives strong reasons for holding that there was from the beginning only one edict and one formula which was applied alike to bonitary ownership and to usucapion.
his stipulation—that it could require his life in the event of his failure.

A second form of contract that came into use in a considerable extent in the latter half of the Republic is what is commonly called the literal contract, or, as Gaius phrases it with greater accuracy, the nomen transcriptio.1 Notwithstanding the prolific literature of which it has been the subject, it must be admitted that in many points our knowledge of it is incomplete and uncertain. The prevalent opinion, formed before the discovery of the Verona MS., had made known Gaius's description of it, and almost universally adhered to ever since, is that such contracts were created by entries in the account-books which the censors insisted that all citizens of any means should keep with scrupulous accuracy, the nomen transcriptio.2 Notwithstanding the text primarily relied on is what remains of Cicero's speech for the player Roscius. From the tenor of the argument in that case, and incidental remarks elsewhere, the conclusion has been formed that a citizen who made an entry in his code—whether of the sale of a cash-book or a ledger is much disputed—to the debt of another, thereby made the latter his debtor for a sum recoverable by an actio certe credita pecuniae. Gaius in his description of the contract does not mention the codices; but his account is not inconsistent with the notion that the entries (nomina) were made in them. He says that those entries were of two sorts, nomina arcaria and nomina transcriptica. The former were entries of cash advances; and of them he observes that they did not have the character of a debt or of a sale, and were not created by payment to and receipt of the money by the borrower. These entries were posted periodically (usually each month) from a day-book (adversaria), and there were distinct pages in the codex in which the entries were made, to mark them off. The second was effected by an actio transcriptio B's debt in a similar way to the debit of a third party (C), hitherto a debtor of B's, and who consented to the transaction—a at the same time crediting B with the amount, and ceding property to him, and marking it as paid to A (expensatio). These nomina transcriptica were purely fictitious entries so far as any passing of money was concerned, though they had to be made by the direction (jus) of the owner who made charges against the debtor. Corresponding entries in the debtor's own codex, though usual, do not seem to have been necessary.

All this at first sight seems just a series of book-keeping operations. But it was much more than that for the Roman citizens whose business it was to settle the terms of any contract. When sale, and lease and the like, so long as they stood on their own merits, created no obligation enforceable at law, however much it might be binding as a duty to Fides or (as moderns would say) in so far as it was just and fair. But there was a strong demand for a measure of security to be clothed in some form approved by the jus civilis. The nexus may possibly have been one of those forms, the vendor or tenant being fictitiously dealt with as a borrower of the price or rent due under his purchase or lease; in which case, as in Roman law, the obligation to pay the price or rent being made legally binding by its embodiment in formal question and answer. But stipulation was competent only between persons who were face to face, whereas usufruct was competent also between persons at a distance, from each other. This was itself a great advantage which, originally at least, was as a negotiorum juris civilis, a security—one advantage over stipulation. But it had also a further advantage, which was not affected by the subsequent receivement of the property, which was in a sense a security, but which bound legal obligation on their own merits: it enabled subsequent transaction of debts from one person to another to be effectuated. This must have been of infinite convenience in commerce, not to mention the administrative use of it, for by obviating the risks attending the transit of money over long distances. It was this that led, as Theophilius says was the case, to the conversion even of stipulatory obligations into book-debts; it was not that thereby the creditor obtained a tighter hold over his debtor, but that an obligation was obtained from him which in a sense was negotiable and therefore more valuable. But in other respects this was much more restricted than stipulation. Thus it only applied to money debts; it did not admit of conditions (though it did admit of a term); and it was never available to peregrini, though the Sabellians proposed that transcription a re in personam should be admitted.

The evolution of the purely consensual contracts—sale, location, partnership and mandate—supplies matter for one of the most interesting chapters in the whole history of the law. But before we inquire into these matters, it is necessary to mark the successive stages in the progress of all of them, to which we shall confine ourselves to sale. The others did not and could not follow identically the same course: location ran most nearly parallel with sale; but partnership and mandate, from their nature, not only started at a different point from the other two, but reached the same goal with them—that of becoming productive of obligation simply on the strength of consent interchanged by the parties—by paths that were sometimes far apart. Nevertheless, a sketch of the history of the origin of the consensual contracts is sufficient to indicate generally some of the milestones that were successively passed by all four.

Going back as far as history carries us, we meet with it under the name of nexus. It was a consensual contract that as early as 1816, 1822, and 1832, were a complete nexus, an absolute nexus, an absolute form of the contract. For mere or originally simply “to take or ” acquire its (acceptere). Sheep and cattle (pecus, hence pecunia) may for a time have been a very usual article of exchange on one party, the money of another, the creditor, had an absolute, as it was still an exchange, instant delivery of goods on one side against simultaneous delivery of so many pounds weight of copper on the other. With the reforms of Servius Tullius, as we have seen, came the distinction between res mercipris and res mercipris; and it is a settled question that the res mercipris was not an absolute, but a kind of contract for more. Fabius, as has been said, perhaps. The reason perhaps of the consensual nature of the transfer of the res mercipris to warrant the transfer of property a warranty that was implied in the mere act. Whether this rule was established from the beginning or developed from the custom is a question in the act, and probably that it was the XII. Tables which fixed that the measure of the transferee's liability to the transferee in the event of transfer should be as much the amount of the debt. Equally impossible it is to trace the origin of the consensual contracts the lex mercipris, and so forth in the mancipation (leges mercipris), which were held binding on the strength of the lex mercipris, in which they were clothed. They received statutory sanction in the Tables, in the words already cited. For more than once was mercipris held to a similar factum in uterque, ut liquidare, jura este, which means in effect whatever shall be held of mouth be declared by the parties in the course of a transaction per actum et libram in definition of its terms shall be law as between them.
or could be enforced simply on the ground that it had taken place. The vendor was bound to support the purchaser in any action by a third party disputing his right, and to repay him the price twofold in the event of that third party's success; and he was bound, moreover, to be good to him any loss he had sustained through a deficiency of acreage he had guaranteed, non-existence of services he had declared the lands enjoyed, existence of others from which he had stated they were free, incapability of a slave for labor, for work, for life, or for liberty. And although the obligations of the vendor were discharged by the payment of a deposit or by the furnishing of a pledge, the latter were only regarded as a delictual character; the obligations were binding, not in virtue of the sale per se, but of the transaction per aequas et libram superimposed upon it; and, if the vendor had at any time to return the price on failure to maintain what he had guaranteed, he could have stipulated that the provisions of the contract as to the sale should operate, but because he had unjustly enriched himself at the purchaser's expense.

In sales of res noc mancipii, just as in those of res mancipi, a vendor who has before him enough to deliver his wares before he had been paid, or had had stipulatory security for the price, or had converted it into a book-debt, might recover them by a real action if payment was unduly delayed; while the purchaser who had paid in advance but failed to get delivery might also get back his money from the vendor on the plea of unwarrantable entailment. But, as mancipation was, as generally supposed, incompetent for carrying the property, some machinery had to be resorted to than that of the security or the sale for imposing upon the vendor of a share of the object or the entire goods and so forth. What it was is a question much controverted among modern writers. It may be that, until trade began to assume considerable proportions, and when a transaction was between citizens, a purchaser was contented to take what he got on his trust, and to rely on the latter's knowledge that he ran the risk of an action for theft if what he sold belonged to another, and partly on the maxim common in all ages and climes, caveat emptor. When it was one between a citizen and a foreigner, the system of the edict on the primitive condition of the art; for between them disputes were settled by actions in factum before the hearers, whose decisions were arrived at very much on considerations of natural equity. On the whole, while admittance is due to the theory that it taught the buyer not to rely on the proceeds of the jus gentium, granted arbitrium for enforcing obligations of parties in sales inter cives even a good while prior to the lex Aequi, the balance of evidence, we think, is in favour of the view that the decision of the factum was that of the judge who facilitated the development of sale into a bona fide contract.

We read of a salutandum secundum mancipium, a stipulatio habere licere and a stipulatio duplae. The nature of the first is obscure; it seems to have been connected with mancipation sales, perhaps with the sale of goods or slaves to a foreigner, for which the expressions are well fitted, and so on. But the nature of the second is still more obscure; for, while the characteristics of the sale of a res mancipi are recognized, he adds that by agreement of parties it might be limited to a stipulium. There were also stipulations against vices in the object sold. We learn from Varro—what is also indicated in various passages of Plautus and Tacitus—that in the sale of cattle, a sale of a sheep or a horse, to find a buyer per aequas et libram of the price, or else to give good positive assurances (at lingua nuncupata, tja jus est), the jurists held him responsible for reticence about burdens or defects he ought to have revealed, and liable for a poena duplii exactly as if he had guaranteed their non-existence.

1 Cicero says (De Off. iii. 16, § 69) that, though by the XII. Tables it was provided that if a vendor per aequas et libram, or else had given his positive assurances (at lingua nuncupata, tja jus est), the jurists held him responsible for reticence about burdens or defects he ought to have revealed, and liable for a poena duplii exactly as if he had guaranteed their non-existence.

and that the latter had not done any mischief for which their owner could be held liable in a nominal action; and similarly that a slave sold was healthy and not chargeable for any theft or other offence for which the purchaser might have to answer. If any of the res mancipi was found to have been taken out of existence, the party relied on the stipulatio ex stipulato against the vendor: "Whereas the plaintiff got from the defendant a stipulation that certain sheep he bought from him were healthy, &c. [repeating the words of guarantee], and that he, the defendant, was liable to him for any such defect which the action has arisen" were substituted in the demonstratio (as the introductory clause of the formula was called) for the detailed recital of what had been stipulated. Bekker justifies this by reference to the language of Varro, who seems to include under the words empli, venditio not merely the agreement to buy and sell but also the stipulations that usually went with it.

The introduction of an actio empli in this shape, however, was far from being the first step towards a pure consensual contract. If the price was not paid at once, the vendor gave his stipulatory promise for it, or got some one on whom the vendor placed more reliance to do so for him, or else the vendor made a book-debt of it; and, if it had to be sued for, it was in all these cases by a condicio or by an action ex stipulato; as, for instance, to recover the price paid but the thing purchased not delivered, the only remedy open to the purchaser was to get back his money by the same condition, unless, indeed, the guarantee habere licere was held to cover delivery, or the thing was sold by the vendor or his agent as a bonae fidei obligatio, in which case an actio in the name of the vendor. This latter possibility means, as Bekker has shown, that the judge could not travel beyond the letter of the engagements of the purchaser. In the latter years of the Republic, and probably a little before the time of Q. Mucius Scaevola, it was a bonae fidei obligatio, and the judge would decide that the right of action had been actually excised. Bekker says: "As the stipulatio duplae is a thing of universal observance, action on the joint is an actio ex stipulato in the true and proper sense. The sale of a slave is a contract; and if the vendor of a slave have failed to give his stipulatory guarantee, for everything that is of general custom and practice ought to be in view of the judge in a bonae fidei judicium.

There was no way to convert the stricti juris actio empli, really nothing more than an actio ex stipulato, into a bonae fidei one—simply the addition by the praetor of the words, "on consideration of good faith (ex fidei bona) to the" whatever the defendant had sold the plaintiff; but, as the effect of the latter guarantee, was immeasurable—not that it did away with the practice of stipulatory guarantees, for Varro wrote at the time of Q. Mucius (who speaks of the action on sale as a bonae fidei one), and references to them are abundant in the pages of the classical jurists, but it rendered them in law unnecessary. It made sale a purely consensual contract in which, in virtue of the simple agreement to buy and sell, all the obligations on either side that usually attended the sale were held embodied without express formulation or (still less) stipulations or even recitations. In the judges' minds, it was to decide in every case between buyer and seller suing ex empli or vendito on principles of good faith, it really empowered them to go far beyond "general custom and practice," and to take cognizance of every contractual practice that would tend to influence their judgment, so as to enable them freely to do justice between the parties in any case and every question that might directly or indirectly arise out of their relation as seller and buyer.

There was no such a thing as the stipulatio duplae (i.e., loan of money or other things returnable generally), commodate (i.e., loan of things that had to be returned specifically), deposit and pledge is even more obscure than that of the common law in England. In the actio empli contra eum, loan of money, corn, &c. was usually contracted per aequas et libram; and it is probable that on the subsequent disuse of the nuxem the

Origio actio empli

obligation on a borrower to repay the money or corn advanced to him was made actionable, under the Silian and Calpurnian laws respectively, by a stipulation contemporaneous with the loan. With the rise of jus gentium, the loan became actionable on its own merits—the duty to repay, as it were, being imposed upon the debtor under a strictus juris obligation to repay it, even though no stipulatory engagement had previously been made; the res— in this case the giving and receiving mutui causa—completed the contract. The obligation arose from it was purely unilateral, and the creditor retained the right to enforce it. The creditor was not bound to accept for the sum paid in full satisfaction of the debt, but could retain it for the purpose of making a new demand; and if the debtor refused to pay it, the creditor could enforce the claim by an action in the courts. If the debt was not paid when demanded, the creditor could recover it by a proceeding in the courts. If the debtor in default, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could recover it by a proceeding in the courts. If the debtor in default, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor in default, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor in default, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor in default, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor in default, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor in default, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor in default, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor in default, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor in default, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor in default, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts. If the debtor did not pay when demanded, the creditor could enforce the claim by a proceeding in the courts.
of libri the right to petition for bonorum possessio opened to the nearest collateral agnates of the intestate, under their old name of legitimi heredes. (3) Under the jus civile, on failure of agnates (and of the gens where there was one), the succession was vacant and fell to the fisc, unless perchance it was usurped by a stranger possessing pro heredibus. The frequency of such vacancies was much diminished by the recognition by the praetors of the right of cognates to claim bonorum possessio in the third place. Who they had primarily in view is now uncertain. The epithet is most frequently applied by modern writers to kinsmen related through females; but in the widest sense it included all kinsmen without exception, and in a more limited sense all kinsmen not entitled to claim as agnates. There were included amongst them therefore—although it is very probable that the list was not made up at once, but from time to time by the action of a series of praetors—not merely kinsmen related through females (who were not agnates), but also agnates of a remoter degree who were excluded partly because the nearest agnates were declined, persons who had been agnates but by reason of capitum minuto had lost that character, female agnates more distantly related than sisters, and children of the intestate who at the time of his death were in an adoptive family. All this is according to proximity, but not beyond the sixth degree and the children of a second cousin in the seventh. (4) Finally, the claim passed to the survivor of husband and wife, assuming always that their marriage had involved a consummation. Thus the praetorian order of succession on intestacy among freeborn citizens. The praetorian order of succession to freedmen and emancipati was necessarily different, the patron or quasi-patron taking the place of agnates; but it is too detailed and complex to be done into here.

All these bonorum possessio had to be formally petitioned for. In that ab intestato descendants were allowed a year for doing so, while other persons were limited to 100 days, the period for those entitled in the second place beginning when that of those entitled, in the first had expired, and so on. The grant was always made at the risk of the petitioner; nothing was assured him by it; it might turn out real and substantial (cum re) or merely nominal (sine re) according to the grant (of the legation). It was not against the heir of the jus civile. For the latter was entitled to stand on his statutory or testamentary right, without applying to bonorum possessio, although in fact he often did so for the sake of the summary procedure it supplied him for ingathering the effects of the deceased.

The Law of Procedure.—The use of the formular system of procedure as alternative to that by the "actions of the law" commenced long before the end of the period now under consideration; and we have occasion more than once to observe how greatly it facilitated the development of the institutions of property and contractual obligation. But as the change was only completed in the early Empire, it will be convenient at this point to consider a preliminary explanation of the nature of the new procedure in the meantime.

IV. THE JUS NATURALE AND Maturity of Roman Jurisprudence

(The Empire until the time of Diocletian.)

i. Characteristics and Formative Agencies of the Law during the Period.

Characteristics generally and Recognition of a Jus Naturale in particular.—The first three centuries of the Empire witnessed the perfection of Roman jurisprudence and the commencement of its decline. During that time the history of the law was marked by so many great landmarks as the enactment of the XII. Tables, the commencement of a praetor’s edict, the recognition of simple consent as creative of contractual bond, or the introduction of a new system of judicial procedure; the establishment of a class of patentated jurists speaking as in a sense the mouthpieces of the prince, and the admission of all the free subjects of the Empire to the privileges of citizenship, are about the only isolated events to which one can point as productive of great and lasting results. There were, indeed, some radical changes in particular institutions, such as the caducity legislation of Augustus, intended to raise the tone of domestic morality and increase fruitful marriages, and the legislation of the same emperor and his immediate successor for regulation of the status of enfranchised slaves; these, although of vast importance in themselves, and the first of them influencing the current of the law for centuries, yet left upon it no permanent impression. It was so much less imposing efforts that it attained the perfection to which it reached under the sovereigns of the Severan house—a steady advance on the lines already marked out in the latter years of the Republic. The subsequent history of the jus naturale became more and more circumscribed, and one after another of the formalities of the strict jus civile was abandoned. The manus of the husband practically disappeared; the patria potestas of the father lost much of its significance by the recognition, notwithstanding it, of the possibility of a separate and independent estate in the child (peculium castrense); slaves might be enfranchised to a certain extent by informal manumission; res monicipi constantly passed by simple tradition, the right of the transferee being secured by the Publician act; servitudes and other real rights informally constituted were maintained as effectual tuitione praetoris; an heir’s acceptance of a succession could be accomplished by any indication of his intention, without observance of the formal crelio of the earlier law; and many of the incidental bargains incident to consensual contract, but varying their natural import, that used to be embodied in words of stipulation, came to be enforceable on the strength of formalless contemporaneous agreements.

The preference accorded by the magistrates and jurists and judges to the jus gentium over the jus civile is insufficient to account for these and many other changes in the same direction, as well as for the ever-increasing tendency evinced to subordinate word and deed to a voluntas general, which they might otherwise rather be attributed to the provisions of the paramount idea of jus naturale. It is sometimes said that the notion of a jus naturale as distinct from the jus gentium was peculiar to Ulpian, and that it found no acceptance with the Roman jurists generally. But this is inaccurate. Justinian, indeed, has excerpted in the Digest and put in the forefront of his Institutes a passage from an elementary work of Ulpian’s, in which he speaks of a jus naturale that is common to man and the lower animals, and which is substantially instinct. This is a law of nature of which it is quite true that we find no other jurist taking account, and it may be attributed to a habit, specially noticeable in Ulpian’s writings, of making tripartite classifications. But though the classical jurists are undoubtedly indistinct in their conceptions about the matter, many of them refer again and again to jus naturale in the sense of law based on natural reason; and Gaius is the only one (Justinian following him) who definitely, though not consistently, makes it synonymous with jus gentium. There can be no question that the latter was much more largely imbedded with precepts of natural law than was the jus civile, but it seems incorrect to say that natural law and jus gentium were identical; it is enough to cite but one illustration, pointed out again and again in the texts: while the one admitted the legality of slavery, the other denied it. While the jus civile studied the interests only of citizens, and the jus gentium those of freemen irrespective of nationality, the law of nature had theoretically a wider range and took all mankind within its purview. The doctrine of the jus gentium agreed in this respect with that of the jus civile—that a slave was nothing but a chattel; yet we find the latter, when tinctured with the jus naturale, recognizing many rights as competent to a slave, and even conceding that he might be debtor or creditor in a contract, although his obligation or claim could be given effect to only indirectly, since he could neither sue nor be sued.

Voigt thus summarizes the characteristics of this speculative Roman jus naturale:—(1) its potential universal applicability to all men, (2) among all peoples, (3) at all times, and (4) its correspondence with the innate conviction of right (innere Rechtsbelehrung), as being the true law of nature. To the pages of the jurists of the period, he formulates thus:—

(1) recognition of the claims of blood (sanguinis vel cognitions ratio); (2) duty of faithfulness to engagements—

1 See Voigt, Das Jus Naturale. der Röm. (2) Roman Law particularly vol. i. §§ 52-64, 89-96; Maine, Ancient Law, chap. iii.
2 Ulp. in Dig. xiv. 7. ir. 14. 3 Voigt, loc. cit. p. 304.
succession had found, citizens, indirectly faith to the proportion civile, gave which Voigt, reorganization F P, his to was ^ of the failed or successors that, men and respectively, of the current of the throne, and usually the second to be recruited to the state, who were privileged or longer by Papinian, who, by reason of the emoluments of the authorities, are entitled to receive a present of 2,000 sesterces, which is to be paid in the manner of the following law.

Influence of Constitutional Changes. —The changes in the constitution aided not a little the current of the law. Men of foreign descent reached the throne and recruited the senate, sometimes to the number of at least 200. Hence the second in the history of the Roman law, yet in most cases free from prejudice in favour of institutions that had nothing to recommend them but their antiquity. Military life, for obvious reasons, had not the same attraction to which men of ambition might aspire; the comitia soon ceased to afford an outlet for public eloquence; so that men of education and position had all the more inducement to devote themselves to the study of the ordinary and judicial law.

This was greatly encouraged by the action of Augustus in creating a class of, so to say, patented jurists privileged to give answers ex auctoritate principis to questions submitted to them by the Emperor. This was done by Hadrian’s reorganization of the imperial privy council, wherein a great proportion of the seats were assigned to jurists of distinction. Several of the emperors had lawyers among their most intimate and trusted friends of main and again, the offices in the domain of the law of contract. As for the fourth, it was one that had to be applied with delicacy; for the voluntas could not in equity be preferred to its manifestation to the prejudice of other parties who in good faith have acted upon the latter..Accessible in a sense legislative of the state, so that, in introducing principles of the jus naturale, of or sequam et bonum, they at the same moment defined and gave them the force of a law. They would not say what was not established, or not admitted, by the laws of the skilful way in which the matter was handled, speculative opinion being held in check by considerations of individual interest and general utility.

In the first view of Voigt’s on the subject is well worthy of being kept in view, that the risk which arose from the setting up of the precepts of a speculative jus naturale, as derogating from the rules of the jus civile, was greatly diminished through the position held by the civil law. Thus the first, the second, and the last of the persons that had already admitted it as a principle that a man was not to be unjustly enriched at another’s cost; the jurisprudence of the empire, however, gave it a wider application than before, and used it as a key to the interpretation of the history and in the domain of the law of contract. As for the fourth, it was one that had to be applied with delicacy; for the voluntas could not in equity be preferred to its manifestation to the prejudice of other parties who in good faith have acted upon the latter. Accessible in a sense legislative of the state, so that, in introducing principles of the jus naturale, of or sequam et bonum, they at the same moment defined and gave them the force of a law. They would not say what was not established, or not admitted, by the laws of the skilful way in which the matter was handled, speculative opinion being held in check by considerations of individual interest and general utility.

of legis actions. The one regulating procedure in private suits at Rome must have been a somewhat comprehensive statute, as a passage in the Vatican Fragments refers to a provision of its 27th section; and our ignorance of its contents therefore, beyond one or two words, is not surprising. Wissak, already referred to, is that the judiciary laws made procedure by formulae compulsory, while the Aebutian law had left it optional. In all cases remitted to a unus judex or other private judges a formula was to be henceforth compulsory: a legis action could not be introduced before private judges but only exceptionally by the centurial council.\footnote{Wissak, Processgeste, i. 191 sqq., and ii. 221 sqq.}

From the time of Tiberius onwards it was the senate that did the work of legislation, for the simple reason that the comitia were rarely convened. The great period of the senatorial school lasted from then on. In the senate became rather too pronounced, men quoting the orato in which he had submitted to it a project of law instead of the resolution which gave it legislative effect. No doubt such project must have been drafted and argued in the council, and rarely stood in need of further discussion; but the ignorance of the formal act that followed it tended unduly to emphasize the share borne in it by the sovereign, and made it all the easier for the emperors after Severus Alexander to dispense altogether with the comitia.\footnote{It may be, however, that the edicts of the peregrine praetors and provincial governors were independently codified. See Girard, Manuel élémentaire, 4th ed. 53-4. An attempt recently made by von Velzen, Z. d. Sav. st. xxii. (1900), 73 sqq., to identify the provincial edicts with those of the peregrine praetor from the time of Augustus is far from convincing and has received no support from other writers. See Kipp, Gesch. d. Quellen, p. 123 n.}

The Consoldated Edictum Perpetuum.—The edicts of the praetors, which had attained very considerable proportions before the fall of the Republic, certainly received some additions in the early days of the Empire. The same independence as of old; there was a greater imperium than theirs in the state, before which he hesitated to lay hands on the law with the boldness of his predecessors. They continued to be delivered, for the most part, by the emperor, or by his order, to the magistrates, with the emperor's own hand, and in the manner of old. The edicts, however, which had been handed down to them through generations; but their own additions were soon almost to mere amendments rendered necessary by the provisions of some senatus consulta that affected the city or the province, were themselves divided into two main classes civilis which had been in the time of Cicero; the emperor, if any, one, was now entitled to the epite the annual edict had lost its raison d'être. Hadrian apparently was of opinion that the time of the edicts was at an end, and before the fourth century the writings of the age were only collected in the edicts, and had a binding force. It did not, however, become statute law, the distinction between jus civilis and jus praetorium still continued.

The revised Edictum, unfortunately, like the XII. Tables, is no longer extant. It is only a very slight account of the contents of the revised Edictum, or two in Eutropius and Aurelius Victor, and a few lines in two of Justinian's prefaces to the Digest. We may assume from what is said there that both abridgment and rearrangement of the edicts of the urban praetor took place, but the question remains how far they were to be consolidated with those of the provincial praetors and other officials who had contributed to the jus honorarium.\footnote{The consolidation got the name of Edictum Perpeta in a sense somewhat different from that formerly imputed to edicta perpetua as distinguished from edicta annua. One may adopt the equivalent, "the emperor's act upon the latter and more enduring and authoritative shape, binding on all future magistrates. He accordingly, it is said, commissioned Salvius Julianus to revise it—or Julian, when urban praetor, may have done so at his own desire.\footnote{Rudorff, De jurisprudentia edictum: edicti perpetui quae reliqua sunt (Leipzig, 1869), and by Brinn in the Krit. Vierteljahrschrift (1870), xi. 471 sqq.; Lenel, Das Edictum Perpetuum: ein beitrag zum Gesch. d. Sav. Stift. (Stuttgart, 1897); or the "Savigny Foundation Prize" offered by the Munich Academy in 1882 for the best restitution of the formulae of Julian's Edict, but goes far beyond the limited subject prescribed; see Brinn's report upon it to the Academy in the Zeitschr. d. Sav. Stift. (1883), iv. 173, 164 sqq. See Karlowa, Röm. Rechtsgesch. i. 528-41; Krüger, Gesch. d. Quellen, 84 sqq.}

The Responses of Patented Counsel.—The right of responding under imperial authority (just respondendi et iuris distorti principis), which developed down to about the time of Severus Alexander, did not imply any curtailment of the right of unlicensed jurists to give advice to any one who chose to consult them.\footnote{Rudorff, De jurisprudentia edictum: edicti perpetui quae reliqua sunt (Leipzig, 1869), and by Brinn in the Krit. Vierteljahrschrift (Böck, 1870), xi. 471 sqq.; Lenel, Das Edictum Perpetuum: ein beitrag zum Gesch. d. Sav. Stift. (Stuttgart, 1897). (French ed. translation by Pellet, 2 vols., 1903-12). The last gained the "Savigny Foundation Prize" offered by the Munich Academy in 1882 for the best restitution of the formulae of Julian's Edict, but goes far beyond the limited subject prescribed; see Brinn's report upon it to the Academy in the Zeitschr. d. Sav. Stift. (1883), iv. 173, 164 sqq. See Karlowa, Röm. Rechtsgesch. i. 528-41; Krüger, Gesch. d. Quellen, 84 sqq.}

The Responses of Patented Counsel (Jurs iuris distorti principis).
give his reasons, reduced it to writing and sent it to the court under seal. Augustus does not seem to have contemplated the possibility of conflicting responses being tendered from two or more jurists equally privileged. It was an awkward predicament for a judge. If he adhered to Hadrian's solution of the difficulty, he would be guilty of so doing in that case the judge should be entitled to use his own discretion. That on receiving a response with which he was dissatisfied he could go on calling for others until he got one to his mind, and then pronounce judgment in accordance with it on the strength of the important and unanimous. but only then, their opinion had force of statute (leges vicem opitutum); and that when they differed the judge must decide for himself.

Interpretations of the Emperors. — Gaius and Ulpian concur in holding that every imperial constitution, whether in the shape of rescript, decree or edict, had the force of statute. It may be that by the time of Ulpian that was the prevailing opinion; but modern criticism is disposed to regard the dictum of Gaius, written in the time of Antoninus, coloured by his Asiatic notions, and not quite accurate so far as least as the edicts were concerned. Apart from executive laws (leges datae), the early imperial edicts were theoretically rather parts of the imperial laws, and the edictum was a portion of the edictum, or an imperial rescript, which had the same jus ediciendi that consule and praetors had had before him, and he had them to indicate some course of action he meant to adopt and follow or some relief he proposed to grant. His edict was not to be conveyed to the individual who happened to be at the instance, but to be written out, and publicly notified in all parts of the Empire. In the range, in course of respect in his imperium, was much greater than that of the praetors had been; for his authority endured for life, and extended over the whole Empire and every department of government. But the imperial rescript was no more bound to adopt any of its edicts than a praetor was to adopt those of his predecessors. That it was not unusual for an edict to be renewed, and that it occasionally happened that the renewal was written out and published as an orality manifest from various passages in the texts. Sometimes, when its utility had stood the test of years, it was transmitted into a senatus-consult ; this fact proves of itself that an edict had no effect until it was officially approved and promulgated. It had the same force that consule and praetors had, and at three successive, whose reigns were of average duration, may have been sufficient to give them the character of consuetudinary law; and, by a not unnatural process, unreflecting public opinion may have taken from a consule and praetor so much as to the longa consuetudo that followed on it, thus paving the way for the assertion by the sovereigns of the later Empire of an absolute right of legislation, and for the recognition of the lex edictalis as the only form of statute.

Rescripts and Decrees. — Rescripts (rescripta, decreta) apparently were acts of war (leges vicem obstim) pretty early in the Empire, and their operation was not theoretically limited to the lifetime of the emperor whom they had issued. But they could not directly be enacted by an emperor, nor to the longa consulatudo that followed on it, thus paving the way for the assertion by the sovereigns of the later Empire of an absolute right of legislation, and for the recognition of the lex edictalis as the only form of statute.

The emperors, from Valerian 

1 Gaius, i. 7; Justinian, Inst. i. 2, § 8. The passages from Pompeius in Dig. i. 2, 2, §§ 48, 49, are of doubtful meaning, and different interpretations of them have been given. Cf. Sohn, Institutionen (translation by Leidic, 2nd ed.), p. 97; Girard, Manuel, p. 70; Kipp, Geschichte d. Quellen, p. 99.

5 Edited by Goudy, 1889, §§ 61-65. See also Krugcr, Geschichte d. Quellen, §§ 18-27; Leibig, Palaeogenia Juris Civilis (2 vols., Leipzig, 1888-89), a work which contains all the texts of the ante-Justinian jurists, as contained in the Digest and other sources, arranged systematically, with valuable critical and explanatory notes, but excluding the Institutes of Gaius, Paul's Sentences and Ulpian's Rules.

A fourth class of imperial constitutions were the so-called mandates. These, however, were mainly of the nature of instructions by the emperors to individual imperial officials, similar to edicts, and dealt with particular occasions.

Professional Jurisprudence. — The present period of legal history is by modern writers sometimes called the classical age of jurisprudence, though that term is more usually and correctly restricted to the years between Hadrian and the close of the first centuries of the Empire. The most eminent jurists of the time of the most eminent jurists of the period, the jurists being the special charge of the magister iuris. From the time of the Gordians to that of the abdication of Diocletian they were almost the only channel of communication between the practical lawyer and the student of the law.

The jurists. — The Institutes of Justinian, the Rules of Ulpian, the Sentences of Paul and a variety of digests and manuals of the period might be made to Murhead's Historical Introduction to the Private Law of Rome, with a brief account of the later works on Roman law. The Institutes, however, is the most important, and the dictionary of the jurists as a whole is the most important work of the period.

ii. Substantive Changes in the Law.

Concession of Peculiar Privileges to Soldiers. — While the period with which we are dealing saw the substantial disappearance of the distinction between citizen and peregrin, it witnessed the extension of another — that between soldiers and civilians (militia, pagani). The most remarkable effluxes of the jus militare (as it is sometimes called) were the military testament and the castrense peculiarity. The first was practically an exempted from all the rules of the jus civil, the praetors' edict alike as to the formation and substance of property. It might be made by a soldier, by a soldier, by the spoken signs perhaps of a dying man; all that was required was the voluntas so manifested as not to be mistaken. More extraordinary still — it was sustained even though its provisions ran counter to the most cherished rules of the common law. Contrary to the maxim that no man could dispense with the institution of an heir or die partly testate and partly intestate, a soldier might dispose of part of his estate by testament with or without nomination of an heir, and leave the rest to descend to his heirs ab intestato. Contrary also to the maxim semel heres semper heres, he might give his estate to A for life or for a term of years, or until the occurrence of some event, with remainder to B. Contrary to the general rule, a Latin or peregrin, or an unmarried or married but childless person, might take an inheritance or a bequest from a soldier as freely as could a citizen with children. His testament, in so far as it disposed only of bona castrensia, was not affected by capitulis dominio minimo. It was not invalidated by praetere often of sui heredes, nor could they challenge it because they had less under it than their "legitim"; nor could the instituted heir claim a Falcidian fourth, even though nine-tenths of the succession had been assigned to legatees. Finally, a later testament did not nullify an earlier one, if it appeared to be the intention of the soldier testator that they should be read together.
All this is remarkable, manifesting a spirit very different from that which animated the common law of testaments. True, it was a principle with the jurists of the classical period that the 
\textit{voluntatis\ raise} was to be given effect to in the interpretation of testamentary writings; but that was on the condition that the respective act of the testator was plausibly and implicitly observed. But in the military testament positive rules were made to yield to the 
\textit{voluntas\ in all respects}: the will was almost absolutely unfettered. Roman law in this matter gave place to natural law. One would have thought that the practice of the testator was constituted the rule of the inheritance, a matter already much discussed in the 
\textit{vicissitudes of the voluntas}. In the \textit{Corpus Juris} the contrast between the \textit{testamentum pagum} and the \textit{testamentum militare} was almost as marked as in the days of Trajan. The latter was still a privileged deed, whose use was confined to a soldier actually on service, and if he returned an honourable discharge, for twelve months after his retirement.

The \textit{peculium castrense} had a wider influence; for it was the first of a series of amendments that vastly diminished the importance of the dowry. Its origin is in a constitution of Augustus granting to the \textit{filius familiae} on service the right to dispose by testament of what they had acquired in the active exercise of their profession (\textit{peculium castrum}), and upon pension was still maintained.

\textit{Confined} was castrense, \textit{the inheritance,} was his. The same emperor allowed them not merely to test on their \textit{peculium castrum}\textit{ filiae familiae} to settle a \textit{testamentum}, and by a little step further the classical jurists recognized their right to dispose of it onerously or gratuitously \textit{inter vivos}. In the 3rd century the range of it was extended so as to include not only the soldier's pay and prize, but all that had come to him, directly or indirectly. From that time it was an established law that the \textit{paterfamilias}\textit{ a} iuris to make a testament as if he were \textit{sui juris}, and in the place the respect for the separate estate in a \textit{filius familiae} which he might deal with independently of his \textit{paterfamilias}, which had not be touched by the latter's creditors, and which he was not even bound to collate (or bring into hotch-potch) on paying a share of his father's succession. The radical right of the parent, however, was rather suspended than extinguished: for, if the soldier died intestate, the right of the \textit{paterfamilias} revived; he took his son's belongings, not as his heir appropriating an inheritance, but as his \textit{paterfamilias} reclaiming a \textit{peculium}.\textit{Castrorum.}

The \textit{Family.—The legislative efforts of Augustus to encourage marriage, to which persons of position showed a remarkable distaste, were crowned with success. Marriage became more frequent, and, and, although that by coercion was still in use in his time, it was almost unknown by the end of the period. Husband and wife therefore had their separate estates, the common establishment of the \textit{paterfamilias} was in the hands of the \textit{vicarius paterfamilias}, who with the revenue of the wife's dower (\textit{dos}) an institution which received much attention at the hands of the jurists, and was to some extent regulated by statute. Divorce (either of common consent or by \textit{rescissio}) was still allowed; but the marriage tie remained mighty; it was lawful even without any assignable cause; when blame attached to either spouse, he or she suffered deprivation to some extent of the nuptial provisions, but there were no other penal consequences.

The law was only in the case of a \textit{filius familiae} who had adopted a \textit{paterfamilias}, and all direct grants of property, with a strong tendency to place restrictions on the exercise of the \textit{patria potestas}. This was due in a great degree to the hold that the principles of natural law were gaining within the Roman system, perhaps due to the fact that the emperors, having succeeded to the censorship \textit{regimen morum}, allowed those principles freely to influence their edicts and rescripts. Exposure of an infant was still apparently allowed; but a parent was no longer permitted, even in the character of a legal judge, to put his son to death or cruelly ill-treat him; in fact his progress was limited to moderate chastisement, the law requiring, in the case of a grave offence that merited severer punishment, that he should bring his child before the competent magistrate. His right of sale, in like manner, was permitted only with the consent of the curule. We have seen that in the case of the impignoration by him was prohibited under pain of banishment.

Except in the solitary case of a son who was a soldier, a \textit{paterfamilias} was still recognized as in law the owner of all the earnings of his children, in \textit{pacta testamentaria} in \textit{pacta testamentaria}: but the old law still remained that for their civil debts he was not liable beyond the amount of the fund he had advanced them to deal with, and the law of \textit{peculium castrum}, even though he had come \textit{sui juris} by his father's death. Between a father and son there was a special relationship, the son being placed in a position of semi-independence. Father and son were considered as having a legal relation, the son being placed in a position of semi-independence. The law and by a little step further the classical jurists recognized their right to dispose of it onerously or gratuitously \textit{inter vivos}. In the 3rd century the range of it was extended so as to include not only the soldier's pay and prize, but all that had come to him, directly or indirectly. From that time it was an established law that the \textit{paterfamilias} could make a testament as if he were \textit{sui juris}, and in the place the respect for the separate estate in a \textit{filius familiae} which he might deal with independently of his \textit{paterfamilias}, which had not be touched by the latter's creditors, and which he was not even bound to collate (or bring into hotch-potch) on paying a share of his father's succession. The radical right of the parent, however, was rather suspended than extinguished: for, if the soldier died intestate, the right of the \textit{paterfamilias} revived; he took his son's belongings, not as his heir appropriating an inheritance, but as his \textit{paterfamilias} reclaiming a \textit{peculium}.\textit{Castrorum.}

The \textit{Family.—The legislative efforts of Augustus to encourage marriage, to which persons of position showed a remarkable distaste, were crowned with success. Marriage became more frequent, and, and, although that by coercion was still in use in his time, it was almost unknown by the end of the period. Husband and wife therefore had their separate estates, the common establishment of the \textit{paterfamilias} was in the hands of the \textit{vicarius paterfamilias}, who with the revenue of the wife's dower (\textit{dos}) an institution which received much attention at the hands of the jurists, and was to some extent regulated by statute. Divorce (either of common consent or by \textit{rescissio}) was still allowed; but the marriage tie remained mighty; it was lawful even without any assignable cause; when blame attached to either spouse, he or she suffered deprivation to some extent of the nuptial provisions, but there were no other penal consequences.

The law was only in the case of a \textit{filius familiae} who had adopted a \textit{paterfamilias}, and all direct grants of property, with a strong tendency to place restrictions on the exercise of the \textit{patria potestas}. This was due in a great degree to the hold that the principles of natural law were gaining within the Roman system, perhaps due to the fact that the emperors, having succeeded to the censorship \textit{regimen morum}, allowed those principles freely to influence their edicts and rescripts. Exposure of an infant was still apparently allowed; but a parent was no longer permitted, even in the character of a legal judge, to put his son to death or cruelly ill-treat him; in fact his progress was limited to moderate chastisement, the law requiring, in the case of a grave offence that merited severer punishment, that he should bring his child before the competent magistrate. His right of sale, in like manner, was permitted only with the consent of the curule. We have seen that in the case of the impignoration by him was prohibited under pain of banishment.

Except in the solitary case of a son who was a soldier, a \textit{paterfamilias} was still recognized as in law the owner of all the earnings of his children, in \textit{pacta testamentaria} in \textit{pacta testamentaria}: but the old law still remained that for their civil debts he was not liable beyond the amount of the fund he had advanced them to deal with, and the law of \textit{peculium castrum}, even though the son was in \textit{pacta testamentaria}, was still more remarkable is in \textit{pacta testamentaria}. The \textit{Praetorian law} of the middle of the 6th century has indeed imposed penalties on those taking undue advantage of the inexperience of minors, i.e. persons \textit{sui juris} under the age of twenty-five; and from that time the praetors were in the habit of granting \textit{in praeture} the right of filing a \textit{actio} against parents and guardianship, and of finally deciding cases in \textit{pacta testamentaria}. This was an important reformation, and it seems to have been widely adopted. But it was Marcus Aurelius that first made curatery a general permanent office, to endure in the ordinary case until the ward attained majority. The powers, duties and responsibilities of those who occupied it, were defined with particular care, and a complete regulation by the jurists, whose exposition indeed of the law of guardianship generally, whether by tutors or curators, has found wide acceptance in modern systems of jurisprudence.

The \textit{Law of Succession.}—

There were far more positive changes in the law of succession than in either that of property or that of obligation. The rise and progress of the military testament has already been explained. The testament of the common law was widely held to be essentially that \textit{per etas librum}; but the practice of granting \textit{honorum possessio secundum tabulas} to the persons named as heirs in any testamentary instrument that bore outside the requisite number of attesting forms from the time of Antoninus Pius, and the neglect of the testamentary claims of \textit{filiae familiae mancipato} and \textit{nuncupatio testamenti}. It was his chart, formerly mentioned, declaring that an heir-at-law should no longer be entitled to dispute the last wishes of a testator on the technical ground that the testament was not in writing. Several of the requirements of the testament, that practically established what Justinian calls the praetorian testament.

One of the commonest provisions in the testaments of the period was the \textit{testamento servorum}, a request that the testator have power to give a share to one of his servants. It was a very common desire, and one entered on the inheritance and thereafter denude wholly or partially in favour of a third party. It was introduced in the time of Augustus by \textit{it is said by Theophilius} a testator who had married a 
\textit{paterfamilias} and was, under the latest rulings of the praetorian law, allowed to deprive the testator of his children, the succession which, as not being citizens, they could neither take \textit{ab intestato} nor as his direct testamentary heirs. He probably soon found imitators, and their number must have rapidly multiplied once the emperor, shocked at the perfidy of a trustee
who had failed to comply with the request of his testator, indicated his approval of the new institution by remitting the matter to the consuls of the day, with instructions to do in the circumstances what they thought just. So quickly did it establish itself in public favor, and be recognized and copied throughout the world, that the institution and fulfillment of testamentary trusts, that under Claudius it was found necessary to institute a court specially charged with their adjudication—that of the praetor fideicommissariorum. It was in service of this court that the praetor fideicommissariorum, benefiting those who were under disqualifications as heirs or legatees, as, for example, persons who had no testamentum factio, women incapacitated by the Vovonian law, unmaried and married but childless persons in-
capable, and the like, was forbidden to testify in time prohibited by statute; but that did not affect its general popularity. For, whether what was contemplated was a transfer of the universal hereditas or an aliquot part of it to the beneficiary (fidei commissum or fideicommissum singularis), a testamentary trust had various advantages over either a direct institution or a direct bequest (legatum). Still the imposition upon the heir of a trust in favor of a beneficiary, and the like, if the inheritance, it did not in theory deprive him of his character of heir or relieve him of the responsibilities of the position; and at common law therefore he was entitled to decline the service, often to the great prejudice of the testator, and at the same time to regulate their relations inter se and towards debtors and creditors of the testator, it became the practice for the parties to enter into stipulatary arrangements about the matter; but there were to be no such agreements formal, the testator in the time of Nero and the Pesianis in that of Vespasian, which not only secured the beneficiary against the testator's (i.e. the heir's) repudiation of the inheritance, but also protected the latter from all risk of the employment of a direct institution and himself ingather the corporeal items of the inheritance. It was one of the advantages of a trust-bequest, whether universal or aliquot, that it might be conveyed in a codicil, even though unconfirmed by any relative testament. The codicil (codicilis), also an invention of the time of Augustus, was a deed of very simple nature. Though in the later Empire it required to be formally attested by witnesses, it was a matter of private, not public, concern. It was inappropriate either for disbursement of suit or institution of an heir; but if confirmed by testator, either prior or posterior to its date, it might contain direct bequests, manumissions, nominations, testamentary provisions, and, in short, any matter that might, as stated, be utilized as a vehicle for trusts. Lately it was held operative, even in the absence of a testament, the trusts contained in it being regarded as burdens on the heir-at-law. The most important changes in the law of intestate succession during the period were those accomplished by the Tertullian and Orphitian senatoriales, fruits of that respect for the precepts of natural law which in so many directions was modifying the doctrines of Roman law. These changes were embodied in the law of the Tertullian and Orphitian senatoriales, which became effective in the second year of the reign of Titus, under Marcus Aurelius. Down to the time of the Tertullian senatorial a mother and her child by a marriage that was unaccompanied with manus stood related to each other on a footing of equality, and their claims to a share of their parents' estate were not considered as defeasible by the death of the other. It was not until the passing of the law of the Orphitian senatoriae that, in the majority of cases, the right to the inheritance of the deceased child was not considered as defeated by the death of the other parent. The Orphitian senatorial was the counterpart of the Tertullian. It provided that, whether legitimate or illegitimate, a right of succession to their mother in preference to all her agnates; and subsequent constitutions extended the principle, admitting descendants of the deceased child not only of their maternal grand-parents but also to that of their paternal grandmother.

iii. Judicial Procedure.

The Formular System.—The ordinary procedure during the greater part of the first three centuries of the Empire was still two-staged; it commenced before the praetor or judge (ius in jure) and was concluded before a judge or judges (ius ex iure). The statutes have given place to praetoriel formularia. Under the sacratamental system, parties...
thereof condemn N. N., and so on.1 Once this point was attained further progress was comparatively easy, the way being open for the construction of formulæ upon illiquid claims arising from transactions in which the practice of stipulation gradually dropped out of use. The idea of the name of the plaintiff and defendant, and the presence in the “intention” of the words ex fidie bona—whatever in respect thereof N. N. ought in good faith to give or do for A. A.2—In the case of real actions the transition from the logis actiones to the formulæ followed a different course. The Aeburian law, while sanctioning the competency of formulæ, did not interfere with the procedure per sacramentum when referred to in the formulary, the court being fideicommisarii in the presence of the right owner. In the time of Cicero that court was apparently still in full activity (supra), but by that of Gaius, owing, it is supposed, to the Julian laws having made formulæ statutory rules, there was no competency for the court or for trials of questions of inheritance. In his time questions of property were raised either per sponsonem or per formulam petitoriae. The procedure by sponson may be regarded as a sort of bridging between the two: the party bringing the suit must produce a declaratory action. In the question of real right was determined only indirectly. The plaintiff required the defendant to give him his stipulatory promise to pay a nominal sum of twenty-five sesterci in the event of the thing in dispute being found to belong to the former; and at the same time the defendant gave sureties for its transfer to the plaintiff, with all fruits and profits, in the same event. The plaintiff that was adjusted and remitted to a judge raiser, that is to say, to the people of the city, by whom wood the sesterci were due or not: the action was in form a personal, not a real one, and was therefore appropriately remitted to a single judge instead of to the centumviral tribunal. But judgment on it could be rendered by either of the two courts: the praetor, or the juridical right; if it was for the plaintiff, he did not claim the amount of the sesterci, but the thing which had been found to be his; and, if the defendant delayed to deliver it, with its fruits and profits, the praetor therefore decided the action, but the juridical action. The petitoriae formula was undoubtedly of later introduction and much more straightforward. Like the condiciæ cætorum pecuniæ, it contained only intention, and condemnation. It ran thus: N. A., who was in the right, and to whom a certain property had been raised, has been raised, belongs to A. A. in juridical right, then, unless the slave be restored, whatever be his value, to that which N. N. has given to A. A.; should it not so appear, you must answer him.3

The formulæ given above, whether applicable to real or personal actions, are so many illustrations of the class known as formulæ juris civilis or in jus conceptae. The characteristic of such a formulæ was that it contained in the “intention” such phrases as the following—ejus esse ex jue Quiritium, praetore oportere,4 dare oportere, dare facere oportere, or dandum decidere oportere.5 Such words were employed with the right to be recognized as the obligation to be enforced has an indirect, not a direct, connexion with the latter’s intention, in the shape of sentence, consuetude or construction. Where, on the other hand, the right or obligation had its sanction solely from the praetor’s edict, special formulæ had to be framed. The actions entered in the Praetorian law included both the cases of actions that had their origin in acts and of actions in which the performance of a contract was the subject of suit. The first were adaptations of actions of the jus civile to cases that did not properly belong to them; the second were actions entirely of praetorian devising, the sacrificial process and the petty vindicatio.6

1 This actio ex stipula was used to be regarded as nothing more than a variety of the condiciæ conscrito. It is doubtful, however, whether in the praetorian law (e.g., the condiciæ conscrito) there was any such demonstratio. See Girard, Manuel, p. 614 n. 5 and 8; and authorities there cited.

2 Employed in the disjunctive actions, i.e., for dividing common property, partitioning an inheritance, or settling boundaries; the demand was made of the assignee of the property that the parties should have a single share as he thought just. See Lenel, Dig. Perp. 2nd ed. pp. 202, 205.

3 Employed in certain actions upon delict, where the old penalties of disability formerly had in practice, or by the praetor’s authority, been substituted into money payments, and the defendant consequently called upon to pay penal payments. According to Lenel, Ed. Perp. 2nd ed. p. 387, the form dare facere praestare oportere was used in actions of this class.

4 These latter have an analogy to the English “action on the case.” In a few instances there was both civil and praetorian remedy for the same wrong; for Gaius observes (iv. 47) that in compound cases or both the consequential and the primary actions must be brought, but these latter have an analogy to the English “action on the case.” In a few instances there was both civil and praetorian remedy for the same wrong; for Gaius observes (iv. 47) that in compound cases or both the consequential and the primary actions must be brought, but

5 Utilis actio may be translated as analogous or adapted action, i.e., analogous to a direct action. Where a direct action was inapplicable to particular cases or persons, according to the terms of a lex, edict, &c., the praetor frequently granted an actio utilis, by which the plaintiff was, in effect, granted an actio utilis. He did so where he thought they were necessary to be given the spirit though not the letter of the law. He effected his object commonly by a modification of the regular formulæ (e.g., by substituting as praetor’s property the parties by transposing names of parties. But sometimes also the adaption was made by the introduction of a legal fiction into the regular formulæ, and in this case the action was called utilis formulae, and to this thereby, be of the two kinds, ordinary and fictitious. Those of common occurrence early became stereotyped in the Edict and even grafted special names. As illustrations of an ordinary actio utilis, in which the formulæ were adapted to new cases and by which the pretended original parties were rendered for wrong in property under the lex Ordinary, Aquilia. Thus this statute in its first chapter used the term occidere, which means killing by a physical act of violence (poison, &c.), but to mean murder by omission (e.g., by poison) the praetors simply substituted the words mortis causam, praestare for occidere in the formulæ. As illustrations of an ordinary actio utilis with subjective transposition of names, we may mention the adaption of the regular formulæ to the case of a bankrupt estate of a living debtor, the action by an assignee of a debt against the debtor, and the action of a procurator suing for his principal. In these names of the bankrupt, cedent and procurator were transposed, and the plaintiff’s name was inserted in the condiciæ.

6 Utilis actio may be translated as analogous or adapted action, i.e., analogous to a direct action. Where a direct action was inapplicable to particular cases or persons, according to the terms of a lex, edict, &c., the praetor frequently granted an actio utilis, by which the plaintiff was, in effect, granted an actio utilis. He did so where he thought they were necessary to be given the spirit though not the letter of the law. He effected his object commonly by a modification of the regular formulæ (e.g., by substituting as praetor’s property the parties by transposing names of parties. But sometimes also the adaption was made by the introduction of a legal fiction into the regular formulæ, and in this case the action was called utilis formulae, and to this thereby, be of the two kinds, ordinary and fictitious. Those of common occurrence early became stereotyped in the Edict and even grafted special names. As illustrations of an ordinary actio utilis, in which the formulæ were adapted to new cases and by which the pretended original parties were rendered for wrong in property under the lex Ordinary, Aquilia. Thus this statute in its first chapter used the term occidere, which means killing by a physical act of violence (poison, &c.), but to mean murder by omission (e.g., by poison) the praetors simply substituted the words mortis causam, praestare for occidere in the formulæ. As illustrations of an ordinary actio utilis with subjective transposition of names, we may mention the adaption of the regular formulæ to the case of a bankrupt estate of a living debtor, the action by an assignee of a debt against the debtor, and the action of a procurator suing for his principal. In these names of the bankrupt, cedent and procurator were transposed, and the plaintiff’s name was inserted in the condiciæ.

Resort to a fiction is sometimes said to be a confession of weakness, and adversely criticized accordingly. But every amendment on the model of a fiction is made by a law, and it is in sympathy with the spirit of Roman jurisprudence, when it found an action too narrow in its definition, to include some new case that ought to fall within it, and to extend it to cover it. It was therefore not at all unusual to bring it within the scope of the existing and familiar action, than to cause disturbance by either altering the definition of the latter or introducing an entirely new remedy. A bonorum possessor may not be able to secure his estate by the tribunus, and therefore entitled offo to employ the actions competent to an heir, either for recovering the property of the defunct or proceeding against his debtors. The praetor could have had no difficulty in devising new actions to meet his case; but he preferred the simpler expedient of inventing the new action out of the old, introducing into the formulæ a fiction of civil heirship; so he did with the bonorum emporum or purchaser of a deceased bankrupt’s estate at the sale of it in his by his creditor. A peregrin could not sue or be sued for the restitution imposed for a culpable damage to property, for the XII. Tables and the Aquilian law applied only to citizens; but he could both sue and be sued under cover of a fiction of citizenship. A man who had acquired a res mancipii on the principle of quiet title, and with the sanction of an order of court, and who had surrendered in court, if he was dispossessed before he had completed his usucapion, could not sue a rei vindicatio for its recovery, for he was not in a position to assert that he was quiritian owner; and his name had been added to the case instead of the cives. But a sufficient title had acquired a title from one who was not in a position to alienate it. But in both cases the praetor granted him what was in effect a rei vindicatio proceeding on a fiction of completed conversion—the Praetorian law, as it was called, confining itself with the fiction. And in this way we have examples of actions fictilae—actions of the jus civilis adapted by this very simple expedient to cases to which otherwise they would have been inapplicable, and forming one of the most important variants of the actions utilis.

Quite different was the course of procedure in the actions in factum, whose number and variety were practically unlimited, although for the most part granted in pursuance of the praetor’s pronuntiation or the Edict, yet to which it ut the instances he might make a remit to a judex (judicium dabo),8 and formulated in accordance with the relative style of documents also published on the album. A great number of them came to be known by special names, as, the actio de dolo, actio negotiorum Quantum, actio hypothecaria, actio de pecunia constituta, actio vi honorum raptorum, actio de superficie, &c., the generic name actio in factum being confined to the innumerable ones. Their formulæ, unlike those in jus conceptae, submitted no question of legal right for the
consideration of the judge, but only a question of fact, proof of which was to be followed by a condemnation. That of the actio de dole, for example, ran thus: "Tibi sit jus, "Should it appear that, through the fraud of N. N., A. A. was induced to convey and of the sale of his property, N. N. has thereby damaged A. A.; if it shall not so appear, you will acquit him." Actions in rem might be uttered as well as direct; e.g., actio quasi-Serviana or necatarius was utile, being based on analogy to the actio Serviana.

Our limits do not admit of any explanation of the purpose, form, or effect of the prescriptions, exceptions, replications, &c., that were engraved on or cut into the public edicts. The" condemnation" was occasionally "taxed" by the praetor, so as to prevent the award of extravagant damages; or of the consequences of defects in the formula; or of the procedure in jure before it was adopted, or (1) judicia et (2) praetor et (3) stipula cases. The review of the judgment by a higher tribunal; or of execution (which was against the estate of the judgment-debtor, and took the form of incarceration only when his goods could not be attached). Our main object has been to show how elastic this was procedure, and how per formatum and in every case, with the relative announcements in the edict, supplied the vehicle for the introduction into the law of an immense amount of new doctrine. The system was fully developed before Julian's codification of the Edict of Carthage (Bekker, ed., i, pp. 1-230). Although it stopped the praetor's power of amending the law, did nothing to impair the efficiency of the existing procedure.

Procedura extra Ordinem. — The two-staged procedure, first in jure and secondly in ordine, seems to have been introduced into private law. Early in the Empire, however, it became the practice in certain cases to abstain from adjusting a formula and making a remit to a judge, and to leave the parties to the disposal of the public quaestor or praetor. In these cases, speaking generally, the magistrate acted as an administrative official. Such cases did not necessarily come before the ordinary judicial praetors; on the contrary, they were common to the praetors especially quaestores, who were appointed to decide them by the emperors. This kind of procedure was adopted sometimes because the claim was that was being made rested rather on moral than on legal right, and sometimes in order to remove the trial to a place which was more convenient. Thus, the earliest questions that were raised about testamentary trusts were sent for consideration and disposal to the quaestors, apparently because, in the existing state of jurisprudence, it was thought that the party involved was a benefactor to maintain his wishes that he was bound in law to pay him (dare oportere) his bequest. Had the difficulty arisen at an earlier period, and in the heyday of the constructive energy of the praetors, they would probably have solved it with an actio in factum. As it was, it fell to the emperors to deal with it, and they adopted the method of extraordinaria cognitio, the jurisdiction which they in the first instance allowed the quaestors to exercise, and the quaestors, magistrates specially designated for it, — the praetor facti commissarius. Questions between tutors and their pupil wards in like manner began to be dealt with extra ordinem, the cognizance being entrusted by the emperors to magistrates specially appointed for it, — the praetor facti. In a case in which a private party was interested went to a praetor facti, whose creation was due to Nerva. Claims for alimony between parent and child, or between foster-parent and foster-child, and freedom rested on natural duty rather than on legal right; they could not therefore be made the subject of a judicium, and consequently went for disposal to the consuls or to the city prefect, and in the provinces to the governor. Questions of status, especially of freedom or slavery, at least from the time of Marcus Aurelius, were also disposed of extra ordinem; and it was therefore that the praetors, in order to oblige them for their honoraria, and by officials for their salaries, the Romans refusing to admit that these could be recovered by an ordinary action of location. In all those extraordinary cognitions the praetors, in their capacity as praetores, derived much from the direct intervention of the praetors and other magistrates in certain cases in virtue of the imperium with which they were invested. This manifested itself principally in the formulae, and more particularly in the praetorium.

Jus Naturale

1. The interdicts have already been referred to as in use under the régime of the jus civile; but their number and scope were vastly increased. The characteristic of the developed procedure by interdict was that in it the praetor reversed the ordinary course of things, and, instead of waiting for an inquiry into the facts, he was expressly empowered to order the praetor to proceed to a determination of the facts true and pronounced an order upon the respondent, which he was bound either to obey or show to be unjustified. The order pronounced might be either restitutori, exhibitio (in both cases usually spoken of as "interdicts"), or go in forma ordinis, in which case, for example, the respondent was ordered to restore something he was alleged to have taken possession of by violent means, to remove impediments he had placed in the channel of a river, and the like; or he might be ordered to restate any estate, or unwarrantably detain or interfere with the body of a freedman of his slave, or a will in which the complainant alleged that he had an interest; or, finally, as for example, that he should not disturb the peace of the moinsing or having himself and his property, as he should not interfere with a highway. This provided the access to a sequestrum, and so forth. If the respondent obeyed the order pronounced in a restitutori or exhibitio decree, there was an end of the matter. But frequently, and perhaps more often than not, the praetor, when the interdict was finally pronounced, was facilitated by spoliations and restitutions, in which the questions had to be tried whether the interdict or injunction was justified, whether there had been breach of it, and (3) if so, what damages were to be indemnified or awarded. The procedure therefore was often anything but summary.

In the possessory interdicts uti possidetis and utribu in particular it was extremely involved, due to some extent to the fact that what was possessed was liable to be possessed by another, and to the fact that it was considered as belonging indisputably to both parties. Gaius says, but, as most modern writers think, erroneously, that they had been devised as ancillary to a litigation about ownership, and for the purpose of deciding whether the possessor's possession was or was not subject to standing on the defensive in the rei vindicatio. That they were so used in his time, as in that of Justinian, cannot be doubted. But it is amazing that they should have been, for they were much more complicated and involved than the rei vindicatio in the ordinary actions, and the rei vindicatio was an interdict uti possidetis, which applied to immovables, as utribu did to movables. Both parties being present, the praetor addressed them to this effect: I forbid that one of you two who does not possess the house in question to force the house that is otherwise in possession, provided he is so neither by clandestine or violent exclusion of the first, nor in virtue of a grant from him during pleasure, from continuing to possess as at present. It is manifest that this decision nothing; it was no more than a prohibition of disturbance of the status quo; it left the question entirely open as to which of the parties was in possession, and which was that was to be interfered with. The manner of its expiration was that the respondent had to effect his removal, or the praetor had

3. The object of the action system of the Romans in the period of the classical jurisprudence, one cannot, help wondering at a chaps. 16-18: Baron, vol. i, §§ 216-219. Procedure in these cases is also included in the civil code.

Keller-Wach, Röm. Civilprocess, §§ 75-80; Röm. Civilprocess, vol. ii, §§ 98, 119-121; Bekker, Akt. vol. (3) missio in possessionem; and (4) in integrum restitution. All these had been in common use during the Republic.

5. Interdicts.
procedure so cumbersome and complex as that of their possessory
interdicts.
2. A prætorian stipulation was a stipulatory engagement im-
posed upon a man by a magistrate or judge, in order to secure a
thing from the party, whether of loss or prejudice. It might be
some act or omission either of him from whom the engage-
ment was exacted or of some other person for whom he was
responsible. Although called prætorian, because the cases
in which they were procurable were set forth in the
Edict, there can be no question that they originated in the jus
civile; in fact, they were just a means of assuring a man in advance
the benefit of an action of the jus civile whereby he might obtain
reparation for any injury he had suffered through the wrongful
act of the other, for reparation contempomised as possible. They were enforced
nearly always by granting or refusing an action or by missio in
possessionem. Ulpian classifies them (rather illogically) as cautenary
(cautenaires), judicial and common. They were purposely
cautious, with the most stringent condition of any action already in
dependence between the party moving the magistrate to exact the stipula-

tion and him on whom it was desired to impose it. There were
many varieties of them, agreed with all branches of the law—for
example, the actio in praecogitatione, against a man who,
by a man's property in consequence, say, of the ruinous condition of his
neighbour's house, the cautio usurphiaria that property ascribed
should revert unimpaired to the owner on the expiry of the usu-
fructuary, etc. When judicial, according to Ulpian's classification, were those imposed by a
judge in the course of and with reference to an action in dependence before
him, as, for example, the cautio judicatam solvi (that the defendant
would pay), the cautio ad causam que statuit (that a cause in
the action would not be fraudulently impeded in the meantime)
and many others. Common were such as might either be imposed
by a magistrate apart from any depending action or by a judge in
the course of an action, as a caution for a tutor or curateur that
his faithful administration of his office, or from a procurator that his
principal would ratify what he did.
3. Missio in possessionem was the putting of a person in possession
provisionally, in the first instance, of the whole estate of
another (missio in bona) or of some particular thing belong-
ing to him (missio in rem). The former was by far the more
important. It was resorted to as a means of execution
not against a judgment-debtor but also against a man
Who fraudulently kept out of the way and thus avoided summing
in an action, or who, having been duly summoned, would not do what
was expected on the part of a defendant; or to seize the estate of a
person deceased to which no heir would enter, thus leaving creditors
without redress, and the creditors themselves resorted to cautio
damni infect; the applicant was then put in possession of
the ruinous property for his own protection.
4. In integram restitutio, a restitution of an individual, on
grounds of the prejudice in the position before the occurrence
which had resulted to his prejudice and for which no other
legal remedy existed was one of the most remarkable
manifestations of the exercise of magisterial imperium.
It was not that the defendant himself was
or indirectly by exception, obtained a judgment that
whether had happened comparatively harmless or gave
him compensation in damages for the loss he had sustained from it,
but if a judge or other official had been

infringement at his own hand pronounced a decree that as far as possible restored
the status quo ante. It was not enough, however, to entitle a man to
this right; it was necessary that he should show that the defendant
had been guilty of some breach of his obligation in the case, or that it
was taken advantage of to his hurt, and that no other adequate means
of redress was open to him; he required in addition to be able to
found on some subjective ground of restitution, such as minority,
or, if a life of lability, insufficient, which could not be resisted,
instead of fact, fraud, injury, or the like. It required
applied for within a limited period—originally an annum utilis, but
under Justinian a quadruminium—counting from the time the
thing was in a position to make the application. So held
to be the jurisprudential ground of restitution, whether objective
or subjective, was at first left very much to the discretion of
the magistrate; but even here practice and jurisprudence in time
fixed the lines within which he ought to confine himself, and made
the principles of in integram restitutio as well settled almost as those
of the actio quod mutus causa or the actio de dolo.

V. THE PERIOD OF CODIFICATION
(Diocletian to Justinian.)

i. Historical Events that Influenced the Law.
Supremacy of the Emperors as Sole Legislators.—From
the time of Diocletian onwards the making of the law was exclusively
in the hands of the emperors. The senator still existed, but shorn of all its old functions alike of government
and legislation. The responses of patrician jurists were a thing of the past. It was to the imperial consistory
alone that men looked for interpretation of old law or promul-
gation of new.

In the reign of Diocletian rescripts were still abundant; but the
constitutions in the Theodosian and Justinianian Codex from the
time of Constantine downwards are mostly of a wider scope, and of
type known as general or edictal laws (leges edictales). It
would be wrong, however, to infer that rescripts had ceased;
for Justinian's Code contains various regulations as to their form,
and the matter is dealt with again in one of its Novels. The reason
why so few are preserved is that they were no longer authoritative
for the parties concerned. The judicial prerogative—where, as
expressly declared by the emperors Arcadius and Honorius in 398
in reference to those they issued in answer to applications for advice
from officials; and it is not unreasonable to assume that a limitation of the
scope which had been made by the latter had been in the
prejudice of those addressed to private parties. Puchta is of opinion that
the enactment of Honorius and Arcadius applied equally to decrete,
for the reason that during this period matters of litigation did not
come under the emperor. In 399 the emperors Theodosius and
Valentinian, who qualified it, however, to this extent—that, if
it contained any distinct indication that the doctrine it laid down
was meant to be of general application, then it was to be received as
an edict or lex generalis. So Justinian adhered in so far as
rescripts in the old sense of the word were concerned; but he
claimed that his judgments (decreta) should be received everywhere
as laws of general application, and so should any interpretation
of a leges edictales, or even of edictales. The imperial
edicts, adjusted in the consistory, were usuall} addressed to the people, the senate or some official,
civil, military or ecclesiastical, according to the nature of their
subject matter.

Influence of Christianity.—A disposition has sometimes been
manifested to credit nascent Christianity with the humaner
spirit which began to operate on some of the institutions of the
Empire which in the first centuries of the Christian
Empire, and in the previous section we have ascribed to the infiltration
of the jus civile doctores of the jus naturale, the product
of the philosophy of the Stoae. The teaching of Seneca
did quite as much—nay, far more—to influence it than the lessons
of Christianity. So far as we can judge, the Christian
belief in the immortality of the soul, which the
emperors of the 2nd and 3rd centuries had generally
sanctioned by Constantine, and more especially after Theodosius
declared it to be the religion of the state, we meet with incon-
testable records of its influence. We find them in enactments in
church, in the law by which concubines, in the
introduction of a mode of manumitting slaves in fact: ecclesiae.

nen (Greifswald, 1853); Keller-Wach, Civilprocess, § 77; Bekker, Aktionen, ii.
chap. 16.
3 There was a senate both at Constantinople and at Rome during the later Empire. In his History, Zosimus, i. 11, says: "[Teodosie seefirst thorlawoov 0 o (Kedia]n actinic (kadeinoow) Panagin, [Theodosio, the Emperor, the

Codification] RO 7369

ROMAN LAW

659
in the recognition of the efficacy of certain acts done in presence of two or three of the clergy and thereby recorded in the church registers; in the disabilities as to marriage and succession with which heretics and apostates were visited, and in a variety of minor matters. Of greater importance were the three features of the Papia-Poppaean law, which was directly responsible—the repeal of the caducious provisions of the Papia-Poppaean law, the penalties imposed upon divorce, and the institution of the episcopalis audientia.

The last of them was to discourage celibacy and encourage fruitful marriages; but legislation in such a spirit could not possibly be maintained when celibacy had come to be inculcated as a virtue, and as the peculiar characteristic of a holy life. The penalties which were imposed for the prohibition of divorce were abolished by Constantine in the year 326. The legislation about divorce, from the first, was a success, was a success, Constantine's enactments on the subject were those of Justinian, forms a miserable chapter in the history of the law. Not one of the emperors who busied himself with the matter, undoing the ill-advisement of his predecessors and substituting his own, was quite as complicated and futile, thought of interfering with the old principle that divorce ought to be as free as marriage and independent of the sanction or decree of a judicial tribunal. Justinian was the first who, because, was not, indeed, a divorce to the law; for to a divorce of common accord (communi consenso), namely, that they should both enter a convent, otherwise it should be null; but, so distasteful was this to popular feeling, and so little conducive to improvement of the tone of morals with which it was intended, as to the subject of religious marriage, was a marriage that it was repealed by his successor. The legislation of Justinian's predecessors and the bulk of his own were levied at one-sided repudiations, imposing penalties, personal and patrimonial (1) upon the act of separation on either party and (2) upon the respective party which was the aggressor. The result was to some extent as sufficient—and the lawful grounds varied almost from reign to reign—and (2) upon the party whose misconduct gave rise to a suit for a divorce. The bishop's court (episcopale judicium) and the ordinary courts were the ordinaries whose jurisdiction was limited to cases in which the parties were not married as primitive Christians, in accordance with the apostolic precept, of submitting their differences to one or two of their brethren in the faith, usually a presbyter or bishop, who acted as arbiter. On the state of things, according to the legislation of Justinian was decided, as to whether the divorce should be rendered by a sanction, Constantine giving the bishop's court concurrent jurisdiction with the ordinary civil courts where both parties appeared. The legislator, and by a later enactment (whose authenticity, however, is open to some doubts), the judge, as emperor, was empowered to allow one of the parties to proceed against the other to the ecclesiastical tribunals in order to remove it to the civil. In either case, it was of the right of the other. He also declared that the judgments were to be enforced by the civil courts. For various reasons, advantage was taken of this power of resorting to the bishop to an extent which seems to indicate that the religious courts were regarded as an ordinary judicial authority and placed next to the civil, which, be it remembered, was a form of legislation the civil, were the same. It is impossible to say with any approach to exactitude what effect this intervention of the clergy as judges in ordinary civil causes—for such and such matters as the civil courts, by express enactment of the law. But it can hardly have been without some influence in still further promoting the tendency to subordinate act and word to will and intention, to deal leniently with technicalities, and to be leniently with leniency of the jure cive with equity and considerations of natural right.

Abandonment of the Formular System of Procedure.—The formular system, with its remot from the praeclarum jure judicis who was allowed to the original party to make a defendant, was the judgment as a rule that a free and independent citizen, untrammeled by officialism, fresh from some centre of business, chosen by, and in full sympathy with, the court, decided the cause. But the new methods of procedure.

New methods of procedure.

1 The truth of this as well as the previous rule depends on the authenticity of a Simonian constitution. See Cuv. Inst. Jurid. ii. p. 686 n.

4 There is, however, a good deal of doubt as to what is meant by the words collatione codicis in this Edict. See Sohm as preceding note, and authorities cited by him.
This constitution has always been regarded as a signal proof of the lamentable condition into which jurisprudence had sunk in the beginning of the 5th century. Constantine, a hundred years earlier, had commanded the notes of Ulpian and Paul upon Papinian. His decrees, doubtless, were an attempt to lay down the principles of the law (jura condenda); and, if it was to be gathered from the writings of those who were dead, it was perhaps as well that the use of them should be regulated. The Valentinian law proceeded so far in the same direction. It made a selection of the jurisconsults of the past and present, and, as far as possible, the law of the empire was taken from earlier jurists whose dicta these five had accepted. But it went yet a step further, for it declared all of them, with the sole exception of Papinian, to be of the same authority, and degraded the function of the jurist to lay down the law of the empire, to the purely arithmetical task of counting up the names, which the industry of the advocates on either side had succeeded in adding in due respect of these respective contentions. It is probable that, from the days of Hadrian down to Severus Alexander, the emperor in his council had to frame a rescript or a decree, its tenor would be decided by the vote of the majority; but that was after argument and counter-argument, which must in many cases have modified first impressions. Taking the votes of dead men, who had not heard each other’s reasons for their opinions, was a very different process. It may have been necessary; but it can have been so only because a living jurisprudence had no existence,—because the constructive talent of the earlier Empire had entirely disappeared.

ii. Ante-Justinian Collections of Statutes and Jurisprudence.

Of cardinal importance for this period were the collections of imperial constitutions made prior to Justinian. There were two such collections, the Theodosian Codes, and the Theodosian Codes; the first two being the work of private hands, though they afterwards received statutory sanction from Theodosius II, the third being due to that emperor.

Codex Gregorianus.—This was a collection of imperial constitutions from Hadrian to Diocletian, made by a certain Gregorius about the end of the 3rd century (a. 295?); who, in Mommsen’s opinion was the author of the Code. Only fragments of it have come down to us, obtained chiefly from Alaric’s Breviary, the Lex Romana Burgundionum, the Consulatio, the Collatio, and the Vatican Fragments mentioned above; but they give us a substantial impression of the law of the eastern empire up to the end of the 3rd century.

Codex Hermogenianus.—This, like the Gregorian, was compiled in the Eastern Empire, apparently at the end of the 3rd century, but at no rate earlier than the year 324. As, however, it contains a considerable number of edicts of the 4th century, it may be assumed to have been added to it. Only fragmentary remains of it are extant, obtained from the same sources as the Gregorian. It is not clear whether the Hermogenianus (perhaps a jurist of that name cited in the Digest), and the work seems to have been a private compilation, or a public record of certain constitutions. It was a smaller work than the latter, being divided only into titles, and, unlike it, contains no pre-Diocletian constitutions. It has, however, a great number of contemporary issues, one issued by Diocletian expressly for the years 293 and 294. It was from this work that and of Gregorius that Justinian obtained the constitutions contained in his Code for the period prior to Constantinople, and from the language he uses about the two Codes it would seem that they had only been arranged in the courts before his time as the only authoritative record of constitutions during the period covered by them.

Codex Theodosianus.—In the year 429 the emperor Theodosius nominated a commission of nine persons to collect the constitutions in existence, to collate the constitutions (conscripta) and the constitutions (in conscriptis). From the terms of the edict appointing them he seems to have intended to prepare the text of the body of law which, if his scheme had been carried into execution, would have rendered the constitutions so much more useful and reliable. Years later he explains the motives that had actuated him; that he saw with concern the poverty-stricken state of jurisprudence and how few men there were who, notwithstanding the prizes that awaited them, were able to make themselves familiar with the whole range of law; and that he attributed it very much to the multitude of books and the large mass of statutes through which the law was dispersed, and which it was next to impossible for any ordinary mortal to master. His scheme was eventually to compile one single code from materials derived alike from the writings of the jurists, the Gregorian and Hermogenianus, and the Theodosian Codes, and to dispose of the time of Constantine downwards. His language leaves little doubt that it was his intention to have this general code carefully prepared, so as to make it a complete exposition of the existing law, which should take the place of all other constitutions. To this end he directed his commissioners to prepare a code, and which was to contain all those that were merely of historical interest (provided only it was made clear how later enactments had affected the ideas of the jurists and the code so established), and which was the result of some reason or other nothing followed upon this enactment, and in 354 a new collection of sixteen persons was nominated to collect the consti- tutions, but nothing was said in their instructions about the actual preparation of a code. The collection was directed to bring together all materials in a systematic way, as by arranging the constitutions chronologically under definite titles, separating, where necessary, any constitutions dealing with more than one matter into parts, so as to bring each matter under its proper title, and to add otherwise to make such omissions, additions and alterations as seemed good to them. The work was completed in less than three years and published at Constantinople early in the year 438, with the declaration that it should take effect from the 1st of January following, and a copy was sent to Valentinian, who notified it to the senate at Rome and ordained that it should come into force in the West from the 12th of January 439. The arrangement of the code has been divided into sixteen books with rubrics in which the constitutions are as a rule (though not consistently) placed in chronological order. They cover the whole field of law, private and public, civil and criminal, fiscal and administrative, military and ecclesiastical. The private law is contained in the first books; the civil law in the second. The third book deals with the "Theodossianus," without codex adjectus. All constitutions since Constantine not contained in it were abrogated. The manuscripts in which it has come down to us are very defective, but many have been formed on the basis of other sources, especially from Alaric’s Breviary. Unfortunately the lacunae are principally in the books relating to the private law.

Novellae Post Theodosianae.—The imperial constitutions subsequent to the Year 438, with the declaration that they would take effect from the 1st of January in each year. The fourth collection of the constitutions of Theodosian III. in 447, was published by the latter emperor in the following year. The second collection contained in addition to constitutions of Theodosius some edicts of Marcellinus and other emperors of the 4th century, with the declaration that it would take effect from the 1st of January in each year. The third collection was published in the following year, the 35th and 45th constitutions being added to it. The third collection was published in the abridgment form in Alaric’s Breviary. These collections are not extant, but from Alaric’s Breviary, with additions from manuscript sources, modern editions of the Novellae have been prepared. The fourth collection contains a number of constitutions between the years 331 and 425, all relating to church matters, first published by T. Sirmidus in 1631, and now known as the Sirmidian Constitutions.

Besides the collections of statutes just mentioned there were a number of juristic works of this period, containing both statutes law (leges) and common law (ius) in combination, made by private individuals. Of these the following, which have come down to us in a more or less imperfect condition, are the most important:

The Collatio Legum Moscitarum et Romanorum—"or, as its title bears, Lex Dei quam praecepti Dominus ad Moneyn—is a parallel of divine and human law, especially in the matter of delicts and punishments, the former drawn from the Pentateuch, the latter from the works of Gais, Papinian, Paul, Ulpian, and

The Codex Gregorianorum—contains the works of Gregory of Nazianzus and others.

These are contained in the Mommsen-Meyer edition of the Theodosian Code.

The Collectio Juris Ante Justinianorum—contains the works of Gais, Papinian, Paul, Ulpian, and

These are contained in the Mommsen-Meyer edition of the Theodosian Code.

The Collectio Juris Ante Justinianorum—contains the works of Gais, Papinian, Paul, Ulpian, and

These are contained in the Mommsen-Meyer edition of the Theodosian Code.

These are contained in the Mommsen-Meyer edition of the Theodosian Code.
Modestiae, rescripts from the Gregorian and Hermogenian Codes, and one later general enactment. Its date is probably soon after the year 390, but its authorship is unknown.1

**Fragmenta Vatikanica.**—These fragments, discovered by Cardinal Angelus von Galen in the Vatican in 1824, form a part of a book of practice, compiled in the Western Empire and of considerable dimensions. The extant fragments of the titles into which it was divided deal with sale, usufruct, dowries, and testamentary provisions in the last resort, and are of great antiquity. Agrippa, and, according to Papinian, the Edict of the Ulpinian, an unknown work on interdicts, and the imperial constitutions prior to Theodosius, the latest of which is of the year 372. Its antiquity is therefore probably about the same as that of the Old Testament.

The *Consultatio.*—The so-called *Veteris cujusdam Jurisconsulti Consulatia* was first published in 1577 by Cujas, from whom it got its name. It is a collection of answers by an advocate, probably of the legal school of theSCR. Papinian, to questions of law submitted for his opinion by a solicitor, and is of value for the extracts it contains from Paul’s Sentences and the three above-mentioned codes. It is thought to have been written in Gaul in the end of the 5th or beginning of the 6th century.

**Syro-Roman Law-Book.**—This was a sort of manual of Roman law drawn up in the East, apparently in the Greek language, at an unknown date, but some time between Theodosius and Justinian. Translations of it into Syriac, Arabic and Armenian have come down to us, and it would seem that the work in these translations was greatly made use of in legal practice in the East (especially in the ecclesiastical courts) for several centuries, and much more authority attached to it than had the Digest and Code of Justinian. As a repertory of Roman law it is of little value, as it misconstrues or varies from that law in many respects, but it is of importance as showing how the earlier sources were used by the authorities who maintained themselves in the East during the decay of the Empire.

Light has also been thrown upon the ante-Justinian law by the numerous papyri documents, mostly in Greek, that have been in recent years recovered in Egypt (especially by Grenfell and Hunt) and elsewhere.2 Mitteis, Graevenitz and others have done much to elucidate these, by numerous publications. But to give anything like a consecutive account of them would occupy much space and extend the work far beyond its present limits.

**Romano-Barbarian Codes.**—Besides the collections of statutes and juristic law mentioned in this section, there were several official collections made prior to Justinian. One, the so-called *Code* of the Ostrogoths, after it had fallen under German influence, of Gothic and other kings. There are three of these, which require special notice—each of them compiled from documentary sources of ante-Justinian law. Though of considerable use in explicating difficult points in the earlier laws, they must be used with caution for that purpose, as they contain not a few corrections of the original texts. They are:

1. Edictum Theoderici.10—This was compiled at the instance of Theodoric, king of the Ostrogoths, not long after the year 500 (not 509, as some have supposed), and was desired to be representative of the emperor and always acknowledged his suzerainty. He did not aim at being an independent legislator, and his Edict is therefore of limited scope and in no proper sense a code. Its materials were

4 E.g. the *Amberth Papyri,* by Grenfell and Hunt. See *Archiv für Philologie,* iii. pp. 150 (1906).

5 For an account of the papyri found at Sinai, containing parts of a commentary on Ulpius, *ad Sabinium,* supposed to have been written after A.D. 438, see Muirhead, *Hist. Introd.* pp. 374, and *Grenfell and Hunt’s Textes,* p. 578. For other papyri, see *Collectio Jur. Ante.* pp. 838-44.

7 In a palimpsest *Monumenta Germaniae,* Leges, v. pp. 145 seq. (Hanover, 1875); see Savy, *Gesch. d. r. R.* ii. pp. 172 seq.; Gaudenzi in *Z. d. Sav. Stift.* (Ger. Arch.), 1886, vii. pp. 29 seq. mainly drawn, without however indication given, from the writings of Paul, the Gregorian, Hermogenian, and Theodosian Codes, and the post-Theodosian Novels. Divided into 155 chapters, with no systematic arrangement, it touches upon all branches of the law, and treats of all cases, but especially criminal law, and procedure.

Though it contains a certain confusion of Gothic law and was, in fact, the work of a learned and eccentric lawyer, in whose case there is no indication of an intention to compile a law code, it was a work which must have been much used, and many of the existing Gothic customs must have continued to prevail for Gothic subjects.

2 The *Lex Romana Wigiliorum* or *Breviarium Alarici* or *Alaricorum* (both of these titles are modern) was a much more ambitious and important collection than the one last mentioned. It was compiled by a commission of lawyers appointed by Alaric II, king of the Western Goths, with the aid of the Breviary (salaire responsum), and the Gregorian and Hermogenian Collections (both of which it reproduces, with the exception of a few passages from the latter), and translated into Gothic (for the mentioned purpose), were accompanied by *interpretationes* (i.e. for the most part explanatory adaptations of the passages to the existing practice) which were largely borrowed from books in current use, the most important of which is the *Interpretation of the XII. Tables* in that they are often not so much explanatory of the text as qualitative or corrective. The Breviary exercised great influence in western Europe; and there is no question that the rise of the Bolognian school in the end of the 12th century, it was from it more than from the books of Justinian that western Europe, other than Italy, acquired its scanty knowledge of Roman Law.

3 The *Lex Romana Burgundiana,* to which erroneously, about the 9th century, owing to a mistake of a MS. transcriber, the name *Papinianus* (a contraction of *Papinianus* was given. It is a collection which King Gundobaud, when publishing in因地, the new code of the Franks, which we shall call the *jurisprudentiae* of the Gothic and other kings. There are three of these, which require special notice—each of them compiled from documentary sources of ante-Justinian law. Though of considerable use in explicating difficult points in the earlier laws, they must be used with caution for that purpose, as they contain not a few corrections of the original texts. They are:

DOMINATION

ROMAN LAW

573

heirs when the marriage was dissolved. Between the time of Constantine and that of Theodosius and Valentine a new form of matrimonial settlement became established. It became apparent that legally sanctioned practice for a man to make (apart from ordinary marriage presents) a settlement on his intended wife either by actual transfer or by retaining his property (though without the power of alienation) during the marriage, but to pass to her on his predecease or on divorce by his fault. This got the name of *donatio ante nuptias*, or sometimes, as being more of a settlement of costs, *donatio post nuptias*. There was some important legislation, about it by the two last-mentioned emperors; Leo and Justin, followed suit; and Justinian, in his Code and Novels, published five or six enactments for its regulation. The first was *abolishing* that if, on the part of the husband, there was a *donatio* of equal amount to be constituted on the part of the husband; that, if one was given during the marriage, a corresponding increase was to be made to the other; that it might be constituted or increased after the marriage without infringing the rule prohibiting donations between husband and wife, which caused Justinian to change its name to *donatio proper nuptias*; that the wife might demand its transfer to her (to the same extent as she could that of the *dos*) on her husband's intestacy, but under obligation to apply its income to the maintenance of the family; and that on the dissolution of the marriage by her husband's death or by a divorce for which he was in fault, she had an hypothec and other ample remedies for reducing it into possession.

The change in the complexion of the relations between husband and wife under the Christian emperors, however, was insignificant when compared with that which had overtaken the relation between parent and child. Justinian in his Institutes reproduces the boast of an early church father: that the child, in his every birth and in the inheritance of his father, was in a sort of the paternal family and that we detect traces of servitude to the imperious will of his consort; but in the main his legislation was dictated by what he was pleased to call *humanitas* so far as the law of persons was concerned, and by naturalis ratio and public utility so far as concerned that of things. The result was the eradication of almost every trace of the old *jus Quiritium*, and the substitution for it, under the name of *jus Romanum*, of that cosmopolitan body of law which has contributed so largely to almost every modern system.

Changes in the Law of the Family.—With the Christian emperors, from Constantine downwards, almost the last traces disappeared of the old conception of the *familia* as an aggregate of persons and estate subject absolutely to the power and dominion of its head. *Manus*, the power in a husband over his wife and her belongings, was a thing of the past; both stood now on a footing of equality before the law; perhaps it might even be more accurate to say, at least with reference to the legislation, that the wife was the more privileged of the two in respect both of the protection and the indulgence the law accorded her. With *manus* the old confarreation and coemption had ceased, marriage no longer needing more than simple interchange of consent, except as between persons of rank (illustres) or when the intention was to legitimate previous issue; in the latter case a written marriage settlement (instrumentum dotale) was required, and in the former both such a settlement and a marriage in church before the bishop and at least three clerical witnesses, who granted the certificate of the completed union. The legislation of the Christian emperors on the subject of divorce, largely contributed to by Justinian in his Novels, has already been referred to. In regard to the disabilities of illegitimate children under the old legislation, it was little more than would be sanctioned in most modern systems as natural emanations of the paternal relationship. Thus he had right of moderate chastisement for offences (for the infant) and of complete separation and alienation of property (for the child). The writ of testamentary nomination of guardians, of pupillar substitution (enlarged by Justinian), and of withholding consent from the marriage of a child, but subject in this last case to magisterial demonstration in insolvency cases. How the right of the *pater familius* over the earnings and acquisitions of his children was modified by the recognition of the peculium castrense has been shown in a previous page. But the modification was carried to such an extent by the Christian emperors as finally to neutralize the father's ownership altogether, except as regarded acquisitions that were the outcome of funds advanced by him to his child for his separate use (peculium propterfectum). Of some of the child's acquisitions a *bona adventicia* his father had, down to the death of the *pater familius*, to the child by order of testamentary nomination of guardians, of pupillar substitution (enlarged by Justinian), and of withholding consent from the marriage of a child, but subject in this last case to magisterial demonstration in insolvency cases. How the classificatory radical right in his son's *peculium castrense* revived on the latter's death; for if he died intestate the former appropriated it not as his son's heir, but as an owner whose powers as such had been merely temporarily suspended. But by the 18th chapters of the famous 118th Novel on the law of intestate succession the privileges of the *pater familius* were abolished, and all a child's belongings except his *peculium propterfectum* were recognized as his own in death as well as in life, so that if any of them should pass to his parent on his intestacy it should only be by title of inheritance, and not by forcible condemnation. In every other branch of the law of the family the same reformatory spirit was manifested. Adoption of *filiusfamilias* was no longer followed in all cases by a change of family for the adoptee, but only when either the adopter was in fact one of his ancestors in whose

1 The best edition is that of Krüger, which is prefixed to the stereotype edition of the Corpus Juris by Mommsen, Krüger and Schoell, vol. i., and also published separately.

2 The best edition is that of Mommsen, Digesta Justiniani (2 vols., Berlin, 1866-70), the printed text of the revised editions of Corpus Juris mentioned in preceding note. A new and handy edition, however, based upon that of Mommsen, by Bonfante and several other Italian professors, is now in course of publication, Books I. and II. (1880), and Book III. (1880) and Book IV. (1890). A collotype facsimile of the Florentine MS. of the Digest is published by the Reale Accademia della Crusca in Italy. Fascicoli 1.-VI. have already (1890) appeared (Rome, 1902-7).

3 The current edition is that of Krüger, forming vol. ii. of the Corpus Juris last mentioned.

4 The best edition is that of Schoell, completed by Kroll in 1895, and forming vol. iii. of the Corpus Juris last mentioned. It contains the Greek texts, Latin Vulgate and a Latin translation more correct than the Vulgate.

5 See Eusein, Milesians, pp. 58-70; Mitteins, Reisrecht und Volksrecht in d. Ost. Provinz., deals with its history, pp. 256-312. Though beneficial on the whole, the regulations of Justinian on this matter seem rather too great an interference with the freedom of marriage settlements.
potesas he had never been, such as a paternal or maternal grandfather, when there was a natural potesas to underlie and justify the civil one—or when an ancestor gave in adoption a grandchild who was in his potesas but would not become sui juris by his death. The potesas was thus very flexible, not only in its capacity to be multiplied, or appeared to have been simplified, or the like, an offspring or child of his, or the child’s grandmother, might be allowed, under certain conditions, to act as its guardian. Slavery was often converted into the milder condition of colonate; but even here this did not happen without risk or anxiety. The freedmen were permitted to claim the protection of the magistrate, and cruelty by a master might result in his being deprived of his human property. Kinship that had arisen between two persons when one or both was a freedman was recognized also as the civil one, if any of the disabilities of birth. The modes of manusmation were multiplied, and the restriction of the legislation of the early empire abolished; and a freeman invariably became a citizen, Junian Latinity and servile servility no longer recognized.

Law of property. The principal changes of the Christian Empire were the simplification of the forms of conveyance, the extension of the colonate, the introduction and regulation of movable property, and the abolition of the necessity of manuscript for the conveyance of land and houses. Simplification of the forms of conveyance was necessary only in the case of res mancipi, for res nec mancipi had always passed by delivery. From the Theodosian Code it is apparent that movable res mancipi, usually by what may be called “the old way” for the conveyance of land and houses—for in jure cessio had disappeared with the formal system—a solemnis traditio, i.e., a written instrument and delivery following thereon, and both before witnesses, had been gradually substituted. Of this there is no trace in the Justinianian Code. For Justian abolished all remains of the distinction between res mancipi and res nec mancipi, between full ownership, bonitarii ownership, andimus jus quititum, placing majority of age and marriage on a level, and required, for the conveyance of land and houses, only the notarized signature of the testator and subscription by the witnesses, thereby becoming what Justinian calls the tripartite testament. There was much hesitating legislation on the subject before the law was finally established as it stands in the Justinianian books; and even at the last we find it encumbered with many exceptions and reservations in favour of testaments that were merely deeds of division by a parent among his children, testaments made in time of plague, testamentary provision by a public servant, and testaments entrusted to the safe keeping of the emperor, and so forth. Codicils had become deeds of such importance as, in the absence of a testament, to be dealt with as imposing a trust on the heir, and forming a kind of will, with many provisos, to prevent them unless attested by at least five witnesses. And a most important step in advance was taken by Justinian in the recognition of the validity of an oral moris cassa trust; for he declared that, if his death-bed had by word of mouth directed his heir to give something to the complainant, the heir should be required either on his oath to deny the averment or to give or pay what was claimed.

Emphyteusis (usu). The Eastern provinces when independent, and which came to be utilized first by the emperors, then by the church, and afterwards by municipalities and private landowners, were occupied by brachydrus, a foreigner or colonist to whom land belonging to them which were unproductive and unprofitable through want of supervision on the spot. Its nature and conditions (which bore a certain similarity to the earlier jus in agro vectigal of the Western Empire, with which it was ultimately merged) and the arrangements of the Eastern leases sometimes granted in the early Empire) were carefully defined by Zeno and amended by Justinian. The emphyteusis, as the grantee of the right was ultimately called, did not have to undertake to cultivate the land, nor was laborious agriculture his duty; the grantee enjoyed being a jus in re aliena, but so extensive as hardly to be distinguishable from ownership. It conferred upon him and his heirs a perpetual right in the lands included in the grant, in consideration of a fixed annual payment to the lord (canon) and due observance of conventional and statutory conditions; but he was not entitled to abandon it, nor able to free himself of the obligations he had undertaken, without the lord’s consent. The latter was especially imposed on the tenant to make due payments into arrear for three years (in church lands for two), or if the land was tenanted in arrear for the same period, or if the emphyteusis allowed the lands to deteriorate, or if he attempted to alienate them (alienare meliora).

1 Dig. xlv. 3. 9.
2 See Elia Lattes, Studi storici sopra il Contratto d’Emphyteusi nelle sue relazioni col Colonato (Turin, 1868), chap. 1 and 3; and Francois, De l’emphyteuse (Paris, 1883); Beaudouin in Nouv. rev. hist. (1898), pp. 545 sq.; Karlowa, Rom. R. G. lii. pp. 1268 seq. The name comes from the obligation imposed upon the grantee to make plantations (lupovrae).

1 Inst. ii. 23, § 12.

Testamentary succession. The changes made in the law of succession by Justinian’s Christian predecessors, especially those of Theodoricus II. and other laws, were such that a new law was necessary, and we should carry us into details which would here be out of place.

Changes in the Law of Succession.—The changes made in the law of succession by Justinian’s Christian predecessors, especially Theodoricus II. and other laws, were such that a new law was necessary, and we should carry us into details which would here be out of place.
but among those the nearest in degree excluded the more remote, and when all were of the same degree they took per capita.

A reform effected by Justinian by his 11th Novel ought not to be passed unnoticed; for it rendered superfluous all the old rules about intestate inheritance. The earlier procurators were chiefly concerned with the legitimate heir's claim to a right of succession, and that a parent had the same right in the succession of his child if the latter had died without issue. The enactment enumerated certain grounds upon which alone it should be lawful for a parent to inherit a grandchild, and this his child, declaring that in every case of disherison the reason of it should be stated in the testament, but giving leave to the person disinherited to dispute and disprove the facts when the testament was opened. If a child was the legitimate heir, and it was eventually in the same position—as not instituted to some share, however small, of his parent's hereditas, he was entitled to have the testament declared null in so far as the institutions in it were concerned, thus opening the succession to himself and the other heirs-at-law, but without affecting accessory provisions, such as bequests, nominations of tutors, &c.; and if the share to which he was instituted was less than his legitimate (legitima de delebita portio) he was entitled to an annual sum of the same amount. As a general rule, the practice of the courts was that the under the practice of the theretribution court of the local tribunal court, a different share to which the child would have been entitled ad intestatum, had been raised by Justinian (by Novel 18) as a substitute for the customary payments of the forerunners of the intestate. He did not allow challenge of the will to be excluded, as in the earlier querela inqisitio testamenti, because the testator had made advances to his child during his life or left him a legacy which qualified him for inheritance as a legitimate heir. What he inserted was entitled to recognition by his parent as one of his heirs, and that to deny him that position without statutory grounds was to put upon him an indignity which the law would not permit.

In legal points of detail, by Justinian may be mentioned the assimilation so far as possible of hereditas and other changes.

Their Use in the Courts and in the Schools.—Although the Institutes were primarily intended to serve as a textbook in the schools, it was expressly declared that it and the Digest and the Codex were to be regarded as just one part of a general piece of legislation and all of equal authority; and that, although Digest and Code were but collections of common law and legislation that had proceeded originally from many diverse hands, yet they were to be treated with the same reverence as if they had been the work of Justinian himself. But while everything within them was to be held as law, nothing outside them was to be looked at, not even the volumes from which they had been compiled. Still the application of the provisions in the Codex of the revised Code, neither the first edition of it nor the Fifty Decisions were allowed to be referred to. If a case arose for which no precedent was to be found, the emperor was to be referred to for his commands. The principle was that only the emperor could make a new law. To preserve the purity of the texts Justinian forbade the use of conventional abbreviations (sigla) in making transcripts, visiting an offender with the penalties of falsification (crimen falsi). Literal transcriptions of the text were forbidden, and the codifications were to be used only to facilitate investigation. This was for many of his subjects: so were indexes and παραλήματα, i.e. summaries of parallel passages, texts or individual titles. Commentaries and general summaries were forbidden under heavy penalties. Justinian's example was not followed with the same preceptation. But these prohibitions do not seem to have been enforced, as we have accounts and remains not only of translations but of commentaries, notes, abridgments, excerpts and general summaries. Justinian's edicts were, at least, by his contemporaries, and their productions were intended primarily for educational purposes; but they soon passed into the hands of the practitioners and were used without scruple in the courts. A Greek Paraphrase of the Institutes, usually attributed to Theophilus, a professor in Constantinople and one of Justinian's commissioners, has been supposed to have been used by him in his prelections. It embodies much more historical matter than is to be found in the Institutes; but it contains a good many inaccuracies, and its authorship has been very differently rated by different critics. Its latest editor, Ferrini, who puts a high estimate on it, is of opinion that the original of it was a recreation in Greek of Gaian, drawn up at Beirut, which was remodelled after the plan of the Institutes. It was afterwards revised, either in a general way or by the Burgundian, and was subsequently incorporated in order to adapt it to the altered conditions; but he denies that there is any sufficient authority for ascribing it to Theophilus. If he be right in assuming that it was really based on a redaction of Gaian, its historical explanations will be received with all the more confidence.

Pala of the Justinianian Books in the East.—The literary work indicated in the preceding section was continued throughout the 6th century, but the result was not an homogeneous work. So the only thing worth noting being the Ενέλθο οι νόμοι των της συνοτορογραφίας (Cod. Theo in 740, professedly the only work of the Justinianian law amended and rearranged; but it was rejected by Basilian, and with reason on account of its imperfections and its audacious departure from the law it pretended to summarize. The last-named emperor, followed by his son Leo the Philosopher, set themselves in the end of the 9th and beginning of the 10th century to the production of an autographic Greek version of the whole of the Justinianian collections and legislation, omitting what had since become obsolete, excising redundancies, and introducing such of the post-Justinianian legislation as was considered worth retaining. The result was the Theodosian Law-Books. The Basilica (Τα Βασιλικα, κα. νόμων), which was completed and published in the reign of Leo, though begun in the reign of Basil, which also published a sort of institutional work, entitled Προβοσμα, which was found in the libraries of the 11th century. The Basilica consists of sixty books, subdivided into titles, following generally the plan of the Justinianian Code, but with the whole law on any particular subject arranged consecutively, whether from right to left, and in Japanese style. The Law-Books, Constantine Porphyrogenitus, made an addition to it in the shape of an official commentary collected from the writings of the 6th-century jurists, the so-called Παραγραφαι των πολιων, which is not the same as the Law-Books, but is a later work; and it was finally received in the 11th century. Its place was taken by epitomes and commentaries, the last being the Exsedem of Constantine the Durable, which is in the form of a commentary on the Law-Books, and which is the work known as the Digest. The Digest itself found its way in all directions in France and Germany, penetrating even into England, mainly through the agency of the church. There must, however, have been other repertories of Roman law in Italy and at Constantinople (and among others probably either Gaian's Commentaries or Ulpian's Rules), as witness a testament made in Paris in the end of the 7th century, mentioned by Saligny as preserved by a certain manuscript in which the testator uses the old formula of the jus civile,—Isum legem, i.e. legem inlaw, heribote, words that are not to be found either in the Visigothic or the Justinianian collections. We know that in this practioner of the year 534, Justinian anew accorded his imperial sanction to the juris de legibus, i.e the Digest and Code, which he says he had long before transmitted to Italy, at the same time declaring that his Novels were to be of the same authority there as in the East. Two years after this came Julian's Latin epitome of the Novels (a private edition of a private edition, and professedly on the command of the emperor himself. That Justinian's works soon came

1 Const. Deo Autore, § 2; Tand., § 21.
3 Byretz, Dei etiuris Graeco-Romani (1839); Morrell, Histoire du droit byzantin (3 vols., 1843-46).
4 Editions by Retz, 1751, and Ferrini, 1844-97.
5 Their Fate in the West.—Before the rise of the Bologna school it was to a much greater extent from the Romano-Barbarian codes than from the books of Justinian that central and western Europe, and most of all Italy, derived the law. Theoderic's Edict can have had little influence after Justinian's recovery of Italy, and the Romano-Burgundian law no doubt gradually displaced Alaric's Breviaire after the death of the king (Eucheoma, a Deutikon etiuris, by Ferrini, 1844 and 1845), and then itself found its way in all directions in France and Germany, propagating even into England, mainly through the agency of the church. There must, however, have been other repertories of Roman law in Italy and at Constantinople (and among others probably either Gaian's Commentaries or Ulpian's Rules), as witness a testament made in Paris in the end of the 7th century, mentioned by Saligny as preserved by a certain manuscript in which the testator uses the old formula of the jus civile,—Isum legem, i.e. legem inlaw, heribote, words that are not to be found either in the Visigothic or the Justinianian collections. We know that in this practioner of the year 534, Justinian anew accorded his imperial sanction to the juris de legibus, i.e the Digest and Code, which he says he had long before transmitted to Italy, at the same time declaring that his Novels were to be of the same authority there as in the East. Two years after this came Julian's Latin epitome of the Novels (a private edition of a private edition, and professedly on the command of the emperor himself. That Justinian's works soon came

1 Constit. Deo Autore, § 12; Tand., § 21.
to some extent into use in Italy is beyond question; for there is preserved in Marini's collection the testament of one Mannes, executed at Ravenna in the reign of Justinian's immediate successor Justin II., in which the requirements of both Code and Novels are scrupulously observed. Of other monuments of the same period nothing is known. If we prove their currency in Italy several are referred to by Savigny in the second volume of his History of the Roman Law in the Middle Ages, among which may be mentioned the Turin gloss of the Institutes, which, though more prominent, was only a little known as the Dictum de consiliariis and the Collectio de tutoribus. The invasion of the Lombards, the disturbance they caused in Italy for two centuries, and the barrier they formed between it and the rest of Europe militated against the spread of the Roman law, at least during the 6th century. In the 11th century, however, without much interruption at law schools in Rome, and also at Ravenna, the seat of the exarchs, to which (but which is doubtful) is a schola (studium) of Rome, revived by Justinian, is said to have been transferred in the 12th century. By the Lombards, as their savagery toned down, the Roman law was so far recognized that they allowed it to be applied to the Romans living within their territory, and it is said even to have been taught in Paris in the 13th century. There is evidence that in the 9th century Justinian's works, or some of them, were already circulating in the hands of the clergy in various parts of Europe. Partly through ignorance and partly through the action of the clergy, the parts of the Justinianian legislation that had hitherto been in ordinary use were the Institutes, the Code and the Novels. The Code and the Novels, however, with their modicum of wheat concealed in a great quantity of chaff, offered little attraction to laymen of intelligent, and, when the charters of Justinian's successors, now concentrated on the Digest, it must have come to them as a sort of revelation. Dogmatic and exegetic teaching of the Corpus Juris in all its parts was actively begun, and a new school arose called the Glossators (glossae). Of this school the work of the glossators is the Corpus Juris, which was indeed regarded as the founder. This great man, who is said to have been trained both in logic and rhetoric and to have afterwards studied and taught Latin at Rome before coming to Bologna, was more than a grammatical and less than a legal genius. He was the first to class the glosses scientifically, and to make a list of them in full. In his Summa Codicis (a work attributed to him by Fitting on evidence which seems almost conclusive), he produced for his contemporaries and successors an incomparably planned and so far systematic manual of the subject-matter of the Code, which is still in use. In his glossators the works of the three above-mentioned men are represented. The glossators got their name from the glossae, i.e., marginal and interlinear annotations (grammatical and doctrinal) with which they furnished the texts of the

Corpus Juris which were in their hands. They also wrote summæ, cases, brochures, &c., for use both in the courts and the schools, and occasionally special treatises. They confined their work entirely to the Corpus Juris, being almost wholly ignorant of the Justinianian, which was afterwards studied for about a century and a half, and ended with Fabricius Accursius, who died in 1260 after having made a systematic but summarized collection of the glosses of his predecessors, which was afterwards called Digesta Justiniani Augusti (books 1-24, tit. 2, Infinitium (books 24, tit. 3), and Digestum (books 3-4)). The manuscripts of these works, used by the glossators, are called the Vulgate (lectio Vulgata), to distinguish them from the Florentine Manuscript (lectio Pisana), on which, indeed (or on the same original source as it), they were probably all primarily based, but from which, on the left side is, as by numerous readings. The historical explanation of the cause of this just-mentioned threefold division is given by Mommsen in the preface to his larger edition of the Digest, to which it will be sufficient to refer. The whole Corpus Juris was by the glossators divided into three. The division made by the glossators contained the first nine books of the Code, and the third, called solu-

men partum legum, containing the Institutes; 134 of the Novels in Latin (known as the Autheneticum); and the last three books of the Digest.

The success of the Accursian gloss was rather detrimental to scientific development of the law. It became a sort of code in itself which both in the schools and the courts tended to supersede the texts of the Institutes. The Justinianian was neglected while lawyers devotes themselves to subtle distinctions and useless divisions of subject-matter. It led to the application during the 14th and 15th centuries of the methods of scholasticism to the law. The codification of the Justinianian, which prevailed during the greater part of these centuries, have been called post-glossators and scribentia or commentators. Their most noted representative was Bartolus (1314-1357), after whom that period is called the Bartolusian. Bartolus, mainly Italian, did much towards developing a definite system of common law in Italy based on the Roman, and thereby facilitated the reception of Roman law in Germany and other countries.

In the 16th century a new start was made in this scholastic jurisprudence, and the Roman law was given to the Roman law. The study of classical antiquities, so active on the side of literature, extended to jurisprudence also. The juridical writings which had been handed down from the Romans ceased to be regarded purely as positive law, binding according to the letter, but as a part of ancient tradition whose spirit as well as form must be examined by the light of the past. Among the pioneers in this new method, to whom the name of Humanists has been given, was the Italian cardinal, Marcellus (1454-1540), of the humanists Lazzaro Canarii (1522-1550) and Donelli (1527-1591). Medieval law passed, and with these jurists began what has been called the modern Roman law, to describe which, however, is entirely beyond the province of this article.

2 Conrat, op. cit., pp. 137-140.

3 Brachylogus totius juris civilis is a fuller title given to it. It has also been called Corpus legum. It first got the name Brachylogus in the 16th century, and the name was perpetuated in the glosses of the three above-mentioned men.

4 See Summa Codicis of Foerster by Fitting (Berlin, 1894). Two other works attributed to Irnerius, called respectively Quaestiones de Substitutibus Juris and a treatise De Aquae, have been edited by the same author. See also Fitting, d. d. S. Stift. xvi. p. 1 seq.

6 See Summa Codicis of Foerster by Fitting (Berlin, 1894). Two other works attributed to Irnerius, called respectively Quaestiones de Substitutibus Juris and a treatise De Aquae, have been edited by the same author. See also Fitting, d. d. S. Stift. xvi. p. 1 seq.
Stylistes; paschal and pentecostal hymns. The MS. of the
hymns, written by his own hand, was said to have been
preserved in the church of Coimbra, in which he was buried and celebrated
as a saint on the 1st of October. Prof. C. Krumbacher, who has
edited the works of Romanos from the best (the Patmos MSS.), regards him as the greatest poet of the
Byzantine age, and perhaps the greatest ecclesiastical poet of
any age.

Editions: J. B. Pitra, Analecta Sacra, i. (1876), containing
29 poems, and Sanctus Romanus Veterum Melodorum Principes
(1888), with three additional hymns from the monastery of St John
in Patmos. See also Pitra’s Hymnographie de l’Eglise grecque (1867);
C. Krumbacher, Geschichte der byzantinischen Litteratur (1897);
and Hymns.

ROMANOV, the name of the Russian Imperial dynasty,
regnant in the male line from 1613 to 1730, and thenceforward
in the female line. The Romanovs descended from Andrei,
surnamed Kolyba, who is said to have come to Moscow from
Prussia about 1341 to enter the service of the grand-duke
Semen (d. 1353). His son Feodor, surnamed Koschka, was
an ancestor of the families of Suchovo-Kobylin, Kalytschev
and Scheremetjev, as well as of the Romanovs. Feodor’s
grandson, Sakhariya Ivanovich, was a boyar of Vasili V.,
grand-duke of Moscow at intervals between 1425 and 1462,
and the family took its name from his grandson Roman, whose
daughter Anastasia Romanovna married the tsar Ivan the
Terrible. Her brother Nikita Romanovich married the princess
Eudoxia Alexandrovna, a descendant of Andrei Jaroslavich,
grand-duke of Suzdal-Vladimir (d. 1524), and in this way the
Romanovs were linked up with the ancient royal house of
Rurik from whom the Romanovs claim descent, the distant
ancestors of the tsars Ivan the Terrible. Some were executed and others
exiled. Nikita’s son Feodor (the archimandrite Philaret)
was banished, but was recalled by the false Demetrius. In
1610 he was imprisoned by the King of Poland, but his piety
and virtues led to the election of his son, Mikhail Fedorovitch
Romanov, to the throne of the tsars in 1613. Philaret became
patriarch of Moscow in 1619, and supported his son’s govern-
ment until his death in 1634. Mikhail was seventeen when he
began his reign, and died in 1645. He was succeeded by his
son Alexis, whose three sons, Feodor III., Ivan IV. and Peter I. (the Great), inherited the throne. After the two years’ reign of
Peter’s widow, Ekaterina Alekseyevna Skavronskaya (Catherine I.), his grandson, Peter Alekseevich (Peter II.), succeeded.
He died in 1730, and the succession devolved on the family of
Ivan IV., on his daughter Anna (1730-40) and his great-grand-
son Ivan III., and in 1741 on Elizabeth, daughter of Peter the
GREAT. Peter the elder daughter, Anna, had married Charles
Frederick of Holstein-Gottorp, and with the accession of her
son, Peter III., in 1762 begins the present reigning dynasty of
Holstein-Gottorp or Oldenburg-Romanov.

kov, Notice sur les principales familles de la Russie (2nd ed., Berlin,
1858).

ROMAN RELIGION. In tracing the history of the religion of
the Roman people we are not, as in the case of Greece, dealing
with separate, though interacting, developments in a number of
independent communities, but with a single community
which won its way to the headship first of Latium, then of Italy
and finally of a European empire. But this very fact of its
ever-extending influence, coupled with an absence of dogmatism
in belief, which made it at times ready and even anxious to
adopt foreign customs and ideas, gave its religion a constantly
shifting and broadening character, so that it is difficult to
determine the original essentials. By the time when Latin
literature begins, the genuine Roman religion had already
been overlaid by foreign cults and modes of thought, by the
classical period it was—except in formal observance—practically
buried and to a large extent fossilized. But the comparative
study of religions has suggested the lines of reconstitution
and the careful analysis of survivals enshrined in literature and
the evidence of monumental remains, and in particular

of the old calendars, has enabled modern scholars to make good
progress in the task of separating the elements due to different
periods and influences.

The Roman people were of Aryan stock, a section of a host
of invaders from the north, who overran and settled in the Italian
peninsula. They preserved traces of their original nationality
not merely in the general cast of their religious thought, but
in certain common features such as the worship of the hearth
(Vesta) and of the sky-divinity (Jupiter) (see GREEK RELIGION).
But the development of their religion was arrested at an earlier
stage than that of the Greeks: with them—at any rate in the
genuine Roman period—Animism never passed into Anthropo-
morphism; they stopped at the conception of the “spirit”
without reaching that of the “god.” Their belief might be
described as a polydemonism rather than a polytheism, and
more correctly, to avoid altogether the intrusion of foreign
notions, as a “multinominism.”

In the cult and ritual of Rome there are enshrined many sur-
vivals from a very early form of religious thought prior to the
development of the characteristic Roman attitude of mind.

**Fetishism.** The belief in the magic or divine power of
inanimate objects—is seen in the cult of stones, such as
the *silex* of Jupiter (Tuppiter), which plays a prominent part
in the ceremonial of treaty-making, and the *lapis* used in the
ritual of the *aqaelicum*, a process, probably magic in origin,
designed to produce rain after a long drought. The boundary-
stones between properties (termini) were also the objects of cult
at the annual festival of the Terminalia, and the god *Terminus*,
the symbolic boundary-stone, shares with Jupiter the great
temple on the Capitol. Tree-worship (q.v.) is again a constantly
recurring feature, seen, for instance, in the permanently sacred
character of the *focus Ruminatis* and the *capiticius* of the
Campus Martius, and above all in the oak of *Tuppiter Feronra*,
on which the *spolia opima* were hung after a victory. Nor did
Roman fetishism stop short at natural objects. The household
objects of the shrine of the family cult, and certain objects in
the house—the door, the hearth, the store-cupboard (penus)—
seem always to have had a sacred significance, and so became
the objects and later the sites of the domestic worship. Of the
cult of animals there is just sufficient trace to show that it must
formerly have had its place in religious rite; the animals, once
the objects of worship, appear in later times as the attributes
of divinities, for instance, the sacred wolf and woodpecker of
Mars.

But Fetishism must very early have developed into Animism,
the feeling of the sacredness of the object into the sense of an
indwelling spirit. In the animistic attitude we have indi-
cated the true background of the genuine Roman religion;
but its characteristic and peculiar development is a kind of
“higher Animism,” which can associate the “spirit” not
merely with visible and tangible objects, but with states and
actions in the life of the individual and the community. No
doubt the later “indologi” (hiding) Peter V., which gives
us detailed lists of the spirits which preside over the various
actions of the infant, or the stages in the marriage ceremony,
or the agricultural operations of the farmer, are due in a large
measure to deliberate pontifical elaboration, but they are a
true indication of the Roman attitude of mind, which reveals
itself continually in the analysis of the cults of the household
or the festivals of the agricultural year.

The “powers” (*numina*, *not deis*), which thus become the objects
of worship, are spirits specialized in function and limited in sphere.
They are not conceived of in any anthropomorphic form, their sex
even may often be indeterminate (*sive mas, sive femina* is the
continually recurring formula of prayer), but the sphere of action
of each is clearly marked and an appeal to a spirit outside his own
special sphere would never be thought of. Locality thus
becomes an important point in the conception of the *numina*;
the household spirits must be approached through the hearth,
the field-spirits through the store-cupboard, and the external spirits of the fields and countryside
have their sacred hill-tops or groves. But the *numina* has no form of
sensuous representation, nor does he need a house to dwell in:
statue and temple are alien to the spirit of Roman religion.
Nor are the *numina*, not being anthropomorphic, capable of relation

xxiii. 19
to one another: hence there is no Roman mythology. Yet, all-powerful in their individual spheres of action, they can influence the fortunes of men and can enter into relations with them. The primary attitude of man to the *numina* seems clearly to be one of fear, which survives prominently in the "faminish" character of the certain of the "faminish" inhabitants of the countryside, such as Faunus and Innuus, and is always seen in the underlying conception of religion, a sense of awe in the presence of a superhuman power. But the practical mind of the Roman gives this relation a legal turn: the *tus sacrum*, which is the dwellings of men with the divine powers, is an inseparable part of *tus publicum*, the body of civil law, and the various acts of worship, prayer and thanksgiving are conceived of under the legal aspect of a contract. The base-notion is that the deity, if they are given their due, will make a return to man: the object of the recurring annual festivals is to propitiate them and forestall any hostile intention by putting them, as it were, in debt to man—more rarely to express gratitude for benefits received.

In such a religion exactness of ritual must play a large part—so large, indeed, that many modern critics have misled into regarding the Roman religion as a mere network of formalities without any background of genuine religious feeling. This formalism shows itself in many ways. It is necessary in the first place to make quite certain that the right deity is being addressed: hence it is well to invoke all the spirits who might be concerned, and even to add a general formula to cover omissions: here we have the ritual specified, that is to say: *in familia* or *in urbe*. Place, again, as we have seen, was an essential element, even in the conception of the *numen*, and is therefore all-important in ritual. So, too, is the character of the offering: male victims must be sacrificed to male deities; female victims to goddesses: white animals are the due of the *di superi*, the gods of the upper world, black animals of the gods below. Special deities, moreover, will demand special victims, while the more rustic *numina*, such as Pales (q.v.), should be given milk and millet cakes rather than a blood-offering. All-important, too, is the order of ceremonial and the formula of prayer: a mistake or omission or an unpitiable interruption may vitiate the whole ritual, and though such misfortunes may occasionally be expiated by the additional offering of a *piaculum*, in more serious cases the whole ceremony must be recommenced *ab initio*. Herein lies the importance of the priesthood: the priest is not, as in other religions, the mediator between god and man, but on the one hand for the purpose of state-worship the chosen representative of the whole people, on the other the repository of tradition and ritual lore.

This conception of the nature of the *numina* and man's relation to them is the root notion of the old Roman religion, and the fully-formed state cult of the *di indigentes* even at its historical inception has been the result of long and gradual development, of which we can to a certain extent trace the stages. The original settlement on the Palatine, like its neighbour on the Quirinal, was an agricultural community, whose unit both from the legal and religious point of view was not the individual but the household. The household is thus at once the logical starting-point of religious cult, and throughout Roman history the centre of its most real and vital activity. The head of the house (*pater familias*) is the natural priest and has control of the domestic worship: he is assisted by his sons as acolytes (*camilli*) and deputes certain portions of the ritual to his wife and daughters and even to his bailiff (*silicus*) and his bailiff's wife. The worship centres round certain *numina*, the spirits indwelling in the sacred places of the original hut in which the family lived. Janus, the god of the door, comes undoubtedly first, though unfortunately we know but little of his worship in the household, except that it was the concern of the men. To the women is committed the worship of the "blazing hearth," *Vesta*, the natural centre of the family life, and it is noticeable that even to Ovid (*Fast.* vi. 291-92) the conception of *Vesta* was still material and not anthropomorphic. The Penates (q.v.) were the *numina* of the store-cupboard, at first vague and animistic, but later on, as the definite deus-notion was developed, identified with certain of the other divinities of household or state religion.

To these *numina* of the sacred places must be added two other important conceptions, that of the *lar familiaris* and the *Genius*. The *lar familiaris* has been regarded as the embodiment of all the family dead and his cult as a consummation of ancestor-worship, but a more probable explanation regards *lar* as the genius of the *familia* (q.v.), and not of the *family*: it is the "household-lar," the "numen which is attached to every man and represents the sum total of his powers and faculties as the *Junone* doves of the woman: each individual worship his own *Genius* on his birthday, and in the *Genius* of the household-congregations the *pater familias*. The established worship of the household then represents the various members of the family and the central points of the domestic activity; but we find also in the ordinary religious life of the family a more direct connexion with morality and a greater religious sense than in any other part of the Roman cult. The family meal is sanctified by the offering of a portion of the food to the household *numina*: the chief events in the individual life, birth, infancy, puberty, marriage, are all marked by religious ceremonials, in some cases of a distinctly primitive character. The dead, too, though it is doubtful whether in early times they were actually worshipped, at any rate has a religious commemoration as in some sense still members of the family.

The next stage in the logical development of the state religion should naturally be found in the worship of the *gens*, the aggregate of households belonging to one clan. *Gens* was the collective name for the household family or a group of families: the word has a sense of community and certainty and a trace of the word in the modern word "genius" indicates that on the whole it was a stricter and less capricious deity than that which we have in the word *numen*. The next stage in the logical development of the state religion should naturally be found in the worship of the *gens*, the aggregate of households belonging to one clan. *Gens* was the collective name for the household family or a group of families: the word has a sense of community and certainty and a trace of the word in the modern word "genius" indicates that on the whole it was a stricter and less capricious deity than that which we have in the word *numen*. This conception of the nature of the *numina* and man's relation to them is the root notion of the old Roman religion, and the fully-formed state cult of the *di indigentes* even at its historical inception has been the result of long and gradual development, of which we can to a certain extent trace the stages. The original settlement on the Palatine, like its neighbour on the Quirinal, was an agricultural community, whose unit both from the legal and religious point of view was not the individual but the household. The household is thus at once the logical starting-point of religious cult, and throughout Roman history the centre of its most real and vital activity. The head of the house (*pater familias*) is the natural priest and has control of the domestic worship: he is assisted by his sons as acolytes (*camilli*) and deputes certain portions of the ritual to his wife and daughters and even to his bailiff (*silicus*) and his bailiff's wife. The worship centres round certain *numina*, the spirits indwelling in the sacred places of the original hut in which the family lived. Janus, the god of the door, comes undoubtedly first, though unfortunately we know but little of his worship in the household, except that it was the concern of the men. To the women is committed the worship of the "blazing hearth," *Vesta*, the natural centre of the family life, and it is noticeable that even to Ovid (*Fast.* vi. 291-92) the conception of *Vesta* was still material and not anthropomorphic. The Penates (q.v.) were the *numina* of the store-cupboard, at first vague and animistic, but later on, as the definite deus-notion was developed, identified with certain of the other divinities of household or state religion.
In passing to the religion of the state we are clearly entering on a later period and a more developed form of society. The loose aggregation of agricultural households gives place to the organized community with new needs and new ideals, and at the same time in religious thought this old vague notion of the *numen* is almost universally superseded by the more definite conception of the *deus*—not even now quite anthropomorphic, but with a much more clearly realized personality. We find then two prominent notes of the state influence, firstly, the adaptation of the old ideas of the household and agricultural cults to the broader needs of the community, especially to the new necessities of internal justice between citizens and war against external enemies, and secondly the organization of more or less casual worship into something like a consistent system. Adaptation proceeds at first naturally enough on the lines of analogy. As Janus is in the household the *numen* of the door, so in the state he is the god associated with the great gate near the corner of the forum: the Penates have their analogy in the *Di Penates populii Romani Quiritium* by whom the magistrates take their oath on entering office, the *Lar familiaris* in the *Lares Praestites* of the community, and the *genius* in the new notion of the *Genius populi Romani* or *Genius urbis Romae*. But the closest and most curious analogy is seen in the case of *Vesta*—the *Vestal Virgins* to the god of the women, whose fire is in part, at least, the *sanctum* in close connexion with the *Regia*, the king's palace; the Vestal Virgins, who have charge of the sacred fire, are the "king's daughters," and as such even in republican times were in the manus of the *pontifex maximus*, who was the successor of the king on the legal side of his religious duties, as the *rex sacrorum* was on the sacrificial side. But adaptation meant also reflection and the widening of old conceptions under the influence of thought and even of abstract ideas. Thus, the simple reflection that the door is used for the double purpose of entrance and exit leads to the notion of the Janus of the state as *bifrons* ("two-faced"): the thought of the door as the first part of the house to which one comes, produces the more abstract idea of Janus as the "god of beginning," in which character he has special charge of the first beginnings of human life (*Consuevus*), the first hour of the day, the Calends of the month and the first month of the year in the later calendar: for the same reason his name takes the first place in the *indulgences*. But development proceeds also on broader and more important lines. Jupiter in the rustic-cult was a sky-god concerned mainly with wine and the vine and dwelt with the same gods on the Capitoline. Now he develops a twofold character: as the receiver of the *spolia opima* he becomes associated with war, especially in the double character of the stayer of rout (*Stator*) and the giver of victory (*Victor*), in which last capacity he later gives birth to an offshoot in the abstract conception of the goddess Victoria. As the sky-god again he is appealed to as the witness of oaths in the special capacity of the *Dios Fidius*, producing once more an abstract offshoot in the goddess Fides. In these two conceptions, justice and war, lie the germs of the later idea of Jupiter as the embodiment of the life of the Roman people both in their internal organization and in their external relations. In much the same manner Mars takes on in addition to his agricultural character the functions of war-god, which in time completely superseded the earlier idea. Finally, we must notice, as the sign of the synoecism of the two settlements, the inclusion of the Colline deity, Quirinus, apparently the Mars of the originally rival community. In these three deities, Jupiter, Mars, Quirinus, we have the great triad of the earliest stage of the state religion.

Organization showed itself in the fixing of the annual calendar and the development of the character and functions of the priesthood, and as we should expect, in a new conception of the legal relation of the gods to the state. In the earlier stage—whose notions of course still persist alongside of the state religion—each household has its own relations to its *numina*: now the state approaches the gods through its duly appointed representatives, the magistrates and priests. Their presence is typical of that of the whole people, and the private citizen is required to do no more on festival days than a ceremonial abstention from work. It is obvious that the state religion has a less direct connexion with morality and the religion of the household, but it has its ethical value in a sense of discipline and a consecration of the spirit of patriotism.

The later stages represent not the spontaneous development of the genuine Roman religion, but its alteration and supersession by new cults and ideas introduced from foreign sources. Authorities are generally agreed in recognizing three periods:—(1) from the end of the Regal epoch to the second Punic War, when Rome was influenced by other peoples in Italy, with whom she was brought into contact by commerce or war; (2) from the second Punic War to the end of the Republic, when contact with Greek and oriental sources and the growth of literature revolutionized religious notions and led to a philosophic scepticism; (3) the Imperial epoch, opening with a revival of old religious notions and later marked by the official worship of the deified emperors and the wide influence of oriental cults.

(1) By the end of the regal period Rome had ceased to be a mere agricultural community and had developed into a city-state. There had consequently grown up within the state a large artisan class, excluded from the old patrician *gentes* and therefore from the state cults they had grown up on, but opened to them by the law of the *dia novenundecim* to form new religious conceptions. But this was certainly not the case in Italy, as, through the mediation of Falerii, a Latin town on the Etruscan border, was due the introduction of Minerva, who, as the goddess of handicraft and protector of the artisan guilds, was established in a temple on the Aventine. Soon, however, she found her way to Rome and, as the temple of Jupiter on the Janiculum, Juno and Minerva, possibly going back from Etruria to Greece, was enshrined in a magnificent new temple built by Etruscan workmen and decorated in the Etruscan manner. In this temple the deities were represented by images, and on its dedication day, September 13th, at the novel festival of the *epulum Jovis*, the images were adored and set out as partakers of the feast, a proceeding wholly foreign to the native Roman religion (see further *Etruria*, § Religion). (2) Secondly, in war and peace Rome formed relations of friendship or enmity with her neighbours of Latium, and, as a sign of the Latin league which resulted, the cult of Diana was brought from Arcia and established on the Aventine in the commune Latinorum *Dianarum Templum*. The same time was built the temple of Jupiter Latiiaria on the Alban mount, its resemblance in style to the new Capitoline temple pointing to Rome's hegemony. So great was Rome's sense of kinship to the Latin confederacy that we are told of the *sacer pictor cohors* that her altar and *pomoerium* the worship of Hercules, which came from Tibur in connexion with commerce, was established at the ara *maxima* in the forum boarium, and the Tuscan cult of Castor as the patron of cavalry found a home close to the forum Romanum: it is a strange thing to note how, as between them and the Etruscans in their origin Greek. Other Italian cults introduced at this period were those of Juno Sospes and Juno Regina, Venus and Fortuna Primigenia, a goddess of childbirth who came from Prænestes. (3) Later on in the first century B.C., a cult was imported from Syria about the wide-reaching introduction of the Sibylline books. Whatever may be their origin—and they came from Cumae—they were placed in the Capitoline temple under the care of a *sacred commission* with annual attributed (January 24th, June 25th, December 14th and Quinquagesima), and their "oracles," which were referred to in times of great national stress, recommended the introduction of foreign cults. In 493 B.C., at a time of serious foreign war, a movement for the introduction of Syrian and Phrygian religions was brought from Epidaurus to the Tiber island in 293 B.C., and Isis and Proserpina, with their strange chthonic associations and night ritual, probably from Tarentum in 293 B.C. With new deities came new modes of worship; the *graece ritus*, in which, contrary to Roman usage, the worshipper's head was unveiled, and the *lectisternium* (*i.e.*), an elaborate form of the "banquet of the gods." In this period, then, we find first a legitimate extension of cults corresponding to the needs of the growing community, and secondly a tendency to more dramatic forms of worship.
(2) The two chief notes of the next period are superstition and secticism: both the populace and the educated classes lose faith in the old religion, but they supply its place in different ways. The disasters of the early part of the second century B.C. were taken by the populace as an omen of the anger of the gods, and the traditional assertion that the Sibyl had foretold the fall of the Julian family led to a revival of the Sibyline books, the last and most celebrated of the oracles at Cumae, to which the name of the ver sacrum and the elaborate Greek lexicosternion after Trasimene in 217 B.C., and the human sacrifice in the forum after Cannae in the following year. The same spirit continues to show itself in the almost wholesale introduction of Greek deities even within the walls of the pomoerium and their ready identification with gods of the old religion, whose cults they in reality superseded. Thus we hear of temples dedicated to Juventas = Hebe (101 B.C.), Diana = Artemis (179 B.C.), Mars = Ares (138 B.C.), and first even then the popular worship in honor of the gods of drink and revelry, a cult of Bacchus, which grew to such proportions in private worship that it had to be suppressed by decree of the Senate in 186 B.C., and later on were established the cults of 3 Phrygia, introduced by Sulla and identified with Bellona, the Egyptian Roman known as Janus Pompilius, and even the Persian Mithras (q.v.). In all these more emotional rituals, the populace sought expression for the religious emotions which were not satisfied by the cold worship of the old deities.

Mighty indeed was the appeal which religious teaching made in the attitude of the educated classes owing to the spread of Greek literature. The knowledge of Greek mythology, to which they were thus introduced, set poets and antiquarians at work in a field wholly foreign to them. They are guilty of creating a Roman anthropomorphic mythology. This they accomplished partly by the popular process of adoption and identification, partly by imitation. In this way grew up the "religion of the poets," whose followers were even more impassioned by their beliefs than by theirs.

Scepticism.

It is a remarkable fact that the two later Greek schools of Epicureanism and Stoicism held aloft on Roman society. The influence of Epicureanism was wholly destructive to religion, but not perhaps more so than that of Stoicism, which also produced attempts, notably those of Scaevola and Varro, at a reconciliation of philosophy and popular religion, in which it was maintained that the latter was in itself untrue, but a presentation of a higher truth suited to the capacity of the popular mind. Such a theory was bound to be fatal, as it makes religion at once a mere instrument of statecraft.

The result on the old religion was twofold. On the one hand, worshipers of the old cults passed away altogether, others survived in name and form, but were so wholly devoid of inner meaning that even the learning of a Varro could not tell their intention or the character of the deity with whom they were concerned. The old priesthood, and in particular the Arval festivals, disappeared, and all religious innovations on political life and were neglected: from 87 to 11 B.C. the office of flamen Dialis was vacant. On the other hand, the result in part of the theory of Stoicism, religion passed into the hands of the philosophian cults formalized or simplified and dressed up in political motives, the membership of the colleges of pontifices and augurs, now conferred by popular vote, was sought for its social and political advantages, and augury was deserted till it became the meanest tool of the state. But this in no way touched the old religion, little survived but the household cult, protected by its secret and vitality.

(3) The revival of Augustus, which marks the opening of the last stage, is the deliberate phenomenon in the whole story. It was no doubt very large, political, and religious for the general renaissance of Roman life, which was to centre no longer round the abstract notion of the state, but round the persons of an imperial house. But it was genuinely religious, in that he saw that no revival could be effective which did not appeal to the deeper sentiments of the populace. It was thus his business to revitalize the old forms with a new and more vigorous content. His new palace on the Palatine he intended to be primarily the seat of the Julian family and the cults associated with it, and secondarily the centre of the new popular religion. With this object he consecrated there his new temple of Apollo (28 B.C.), associated for long with the Julia, and used by Augustus as his special patron at Actium, and transferred to it the keeping of the Sibyline books, thus marking the new headquarters of the Greco-Roman religion. Similar in purpose was his institution of the ludi sacrae in 17 B.C., in which a day celebration was added. The cults of Apollo and Diana, which had been set up as a counterpart to the Capitoline Jupiter and Juno: Horace's hymn written for the festival is a good epitome of Augustus's religious intentions. In the same spirit he established a new shrine of Venus Genitrix in the Alban Hills, and set up a new temple as the avenger of Caesar's murderers. Nor did he hesitate to avail himself of the popular outburst, which immediately after the murder had consecrated the site of Caesar's cremation with a bustum, to erect on the spot a permanent temple to his adopted father, under the dedicatory religious title of deus Julius. No doubt he also did much generally to revive the ancient cults: he rebuilt, as he tells us himself, eighty-two temples which had fallen into disrepair, he re-established the old priesthhoods, filling once more the office of flamen Dialis and reviving such bodies as the Sodales Titii (see Titus Tatius) and the Arval Brothers (q.v.); but the new revival was attached itself primarily to these four cults, and their tendency was unmistakable. Originally, no doubt, Augustus designed to attract religious to the imperial cults, but he soon saw that the chief tendency of the more personal note should be given to it. The dedication of Julius Caesar was one important step: another was the natural prominence in the palace of the cult of the Genius of the emperor himself. As the power of the cult of the imperial Genius was bound to spread, and ultimately Augustus sanctioned its celebration at the compito together with the worship of the old Lares. But here he and the wiser of his successors drew the line, and though under oriental influence divine honours were paid to the living emperor outside Italy, they were never permitted officially in Rome. In the succeeding centuries Augustus's intentions were realized with a fullness which he would hardly have wished, and the cult of the imperial house practically superseded the state religion as the official form of worship.

With this last period the story of Roman religion draws to a close. For, though the form of the old cults was long preserved and even Antoninus Pius was honoured in an inscription for his care of the ancient rites of religion, the vital spirit was almost gone. In the popular mind the gods had become a mere ritual of statecraft. In the 3rd and 4th centuries the Empire filled Rome with the new cults of the Sun, of Mithras, and of the Diana of Pauvre, the worship of which was with the emperor, held undisputed sway; and with the more educated a revived philosophy, less accurate perhaps in thought, but more satisfying to the religious conscience, gave men a clearer monotheistic conception, and a notion of individual relations with the divine in prayer and even of consecration. It was with these elements—fiercely antagonistic because so closely allied in character—that the battle of Christianity was really fought, and though, after its official adoption, the old religion lingered on as "paganism" and died hard at the end, it was really doomed from the moment when the Augustan revival had taken its irrecoverable bias in the direction of the emperor-worship.

ROMANS, a town of south-eastern France, in the department of Drôme, 125 m. N.E. of Valence on the railway to Grenoble. Pop. (1906) town, 13,304; commune, 17,622. Romans stands on an eminence on the right bank of the Isère, a fine stone
bridge uniting it with Bourg-de-Peage (pop. 4668) on the other side of the river. Both towns owe their prosperity to their situation in the most fertile part of the valley of the Isère. The present parish church belongs to the religious house of St Bernard, bishop of Vienne. The principal portal is a fine specimen of 12th-century Romanesque, and the lower part of the nave is of the same period; the choir and the transept are striking examples of the style of the 13th century.

Romans has a tribunal of commerce and a communal college. Its industries include tanning, leather-dressing and shoe-making, silk-spinning, hat-making, absinthe-distilling and oil-refining. There is trade in walnuts, walnut-oil, silk, cattle, &c.

**ROMANS, EPISTLE TO THE.** In this book of the New Testament, the apostle Paul begins, after a brief pregnant introduction (i. 1-7), by explaining that he had hitherto been prevented from carrying out his cherished project of visiting the church of Rome, whose faith was world-wide (i. 8 f.). Meanwhile, he outlines the gospel which he preached as an exhibition of God's righteousness, *ex pietate et pietur.* This forms the leading theme of the epistle.

Both Gentile (i. 18-32) and Jew (ii. 1, 2) alike have missed this righteousness up till now, but the revelation of God in Jesus Christ (iii. 21-31) has brought the divine boon within reach of all. The salient feature of this righteousness is the grace which, as Paul stops for a moment to argue (iv. 1-25), the Jewish cannot claim any preference; Abraham himself, before circumcision and the law came into force, was a man of faith, and consequently all believers (not Jews only) are regarded by Paul (v. 6) as his spiritual offspring. Returning to the blissful results of this *Frömmigkeit* revealed in Jesus Christ (v. 1-11), Paul proceeds to contrast these with the sombre effects produced in humanity by the fall of Adam. Life now triumphs over death (v. 22, 24). But the kingdom of death, which was bound up with the regime of sin and death, does not mean the relaxation of the moral bond. On the contrary (vi. 1 f.), the reception of God's grace and spirit implies the death of the believing man to sin. The struggle of the Jew, however, between law and spirit, between the demands of the law (vii. 1 f.) cannot be ended happily save by the intervention of Jesus Christ, whose Spirit guarantees a sound life in this world and life eternal in the world to come (viii. 12 f.).

The splendid and unfeigned prospect here, which thus break on the apostle's vision, only serve to deepen his distress in one direction. As a theologian and as a patriot, he is confronted with the problem of Israel's collective repudiation of a boon to which their forefathers had professed to be attached, and: it clearly pointed. Reverting to the thought of ii. 17 f. and iv. 1, Paul now essay, in ix.-xi., to show how this unbelief of Israel is to be reconciled with the justice and the promises of God. He begins by showing, as in Gal. iv. 7 f. (cf. Rom. ii. 28-29), that mere physical descent could not entitle a Jew to the promises made to Abraham, for it was to challenge God's sovereign freedom. If God determines to extend the promise of faith to the Gentiles, who shall accuse him of injustice? The rejection of the Jews is their own fault, due to their obstinacy and unbelief; they shall perish (x. 13-21). Finally, Paul tries to see this fact of Israel's unbelief in the light of a wide religious philosophy of history: it (xi. 1-10) cannot be anything but a temporary and partial (xi. 11-24) phase; the future will clear up the present; the final result will be the inclusion of all Israel in the heritage of the messianic kingdom of Christ. The prospect of this consummation stirs him to an outburst of admiration, with which the whole section ends (xi. 33-36).

Applying the thought of God's mercy to the obligations of believing masters and servants (i. 8-20), Paul proceeds now to sketch the ethical duties of Christians in the church (xii. 1-21), in society, and in the state (xii. 1-7): love is the supreme law (xii. 8-10), and the nearness of the end the supreme motive to morality (xii. 11-14). These ethical obligations are summed up in God's standard for Christian character and conduct (xv. 1-6), and for Christian forbearance. Finally, he exalts all, Gentile and Jewish Christians alike (xv. 8-13), to unite in thanksgiving for God's mercy to them in Christ.

The chief problem of the epistle arises here, for it has been thus addressed the Roman Christians. He argues (xiv. 1 f.) his apostolic vocation and informs them of his future movements. With an appeal for their prayers and a brief benediction, the epistle then closes (xv. 30-33). It ends as it began (i. 8 f.) with the apostle's hope and plan of visiting Rome on a subsequent missionary tour.

Rom. xvi. contains a separate note (i. 23-23), together with a doxology (24-25). The former came from Paul's pen, but it did not belong originally to this epistle. In all likelihood it is a letter of commendation for Barnabas, which includes vers. 1-23 and e.g. Weitzsacker, McGeiiffert and Jullicher, though most break it off at vers. 20 (so Eichhorn, Ewald, Schuppe Renan, Weiss, Lipsius, von Soden, &c.), while others do not begin it until vers. 3 (so e.g. Ewald, Schurter, Reuss and Mangold; Der Romerbrief, pp. 136 f.). Vers. 21-23 might indeed follow xvi. 33, but it is not Paul's way to add salutations after a final Amen, and the passage connects as well with xvi. 20, though it may have lain originally (Jülicher) between 16 and 17. The main reasons for conjecturing that this section was addressed separately, not to Rome but to a city like Ephesus, lie in its contents. Paul was as yet a stranger to Rome, and it is extremely difficult to suppose that he already knew so many individuals there. The earlier tone of Romans shows that he was writing as a comparative stranger to strangers. Any tactualities of his life with the familiar circumstances of Rome (as in xiv.-xv.) are no more than might have percolated to him through having been botanically in his vocabulary. For a defence of his accuracy, see W. M. Ramsay's *Pauline and other Studies* (1907), 210 f.

On the method of dialectic in this section, see Bishop Gore's paper in *Studia Biblica* (vol. iii.). The literature up to 1907 is represented by H. J. Stübel, *Der Romanbrief* (1904, pp. 671 f.), one of the most significant essays being that of Beelitz on *Die paulin. Theodisce* (1886). Wernle (Beginnings of Christianity, i. pp. 315 f.) sums up his discussion by pointing out that "the Jesus of history is simply non-existent for St Paul when he treats apologetics problems of this nature." No modern writer has made of him the three chapters of Romans which treat of Israel's fate. The literal text of the Septuagint seems to be the only decisive authority, and that is so sacred and almighty, that, whenever it comes into collision with human conscience, the latter is silenced when the voice of revelation speaks.

The weaker minority probably were a Jewish-Christian circle (cf. Riegenbach in *Studien und Kritiken*, 1903, pp. 649-678). For the attacks on the church, see von Dobschütz's *Christian Life in the Primitive Church* (1904), pp. 125 f., 396 f.

It was a sufficient reason for writing to the Romans that Paul was under the necessity of postponing an event to which he had long looked forward. There was nothing in the circumstances of the church that required his intervention, and, as he was therefore free to choose his subject, he chose the question of the fullness of his heart that grand defence of the gospel which, though engendered by the conditions of the times, is animated by the timeless Spirit, and has proved to be a possession for ever (Drummond, p. 246).

For the literature, cf. the press's Historical New Testament,, pp. 266-267, by W. H. Schaff. All the hypotheses have won very wide acceptance, but several editors and critics (including Harnack, Zahn, and Clemen) remain unconvinced. Also Waebz in *Revue de théologie et des études religieuses* (1906), 461-469.

On her functions, see Zehnack's *Die Dienst-und Frau in den ersten Jahrhunderten der christlichen Kirche* (1902), pp. 45 f.

1 Cf. Lucht *Über die beiden letzten Kapitel des Römerbriefes*, 1901, pp. 126 f., with Weitzsacker's brilliant pages in his *Apostolic Age*, i. pp. 379 f.)
report; they do not imply the presence of friends upon the spot who kept him supplied with information. On the other hand, the circle of people addressed in xvi. 1–23, with a notion of individual colour and personal relations, forms a sphere where Paul had worked for long. He can appeal to these Christians. He can speak sharply with authority to them. Now, as he wrote from Corinth, the only other city which answers to this description is Ephesus, the centre of Paul's long Asiatic mission. With that city and district several of the names in xvi. 1–23 are more or less directly connected, e.g. Epenetus (5), Aquila, and Priscilla (3), who were at Ephesus immediately before Romans was written (Acts xviii. 18, 26; cf. 1 Cor. xvi. 19), and apparently were there (cf. 2 Tim. iv. 19) not long afterwards. These are the first people mentioned in the note, nor is there any likelihood that they or the rest of Paul's friends1 had made a sudden migration to the capital. Doubtless, there was fairly constant communication between Rome and the provinces, and in the course of time these friends may have gradually followed the apostle thither. Hence it is not remarkable that almost all the names mentioned in this note have been found by archaeologists (cf. Lightfoot's Philippian, pp. 171 f.) within the Roman Corpus Inscriptionum. Most of them, anyhow, are fairly common throughout the Roman world (cf. Lietzmann, p. 73). There is still another centre in the Greek Minor, and in the Greek Corpus Inscriptionum for Asia Minor (e.g. Epenetus, Hermes, Hermas).2 Furthermore, the sharp warning against errorists and heretics (xvi. 17–20) suits Rome at this period much less aptly than Ephesus (cf. 1 Cor. xvi. 8–9; Acts xx. 29 f.; Rev. ii. 2 f.), where trouble of this kind was in the air. Controversy against false teachers is conspicuously absent from Romans. Nor is it possible to regard (with Zahn) such counsels as merely prophylactic; they are too definite and pointed. They imply the existence of a community with which Paul was personally acquainted, and to which he felt himself bound and free to address keen, authoritative reproaches.

The textual phenomena of the doxology (xvi. 25–27), which occurs in some MSS, after xiv. 23, are sufficiently strange; they suggest that the epistle must have passed through a certain process of editing, during the 2nd century, previous to its final incorporation in the canon of the epistles.3 It may further be conjectured that the epistle does not lie before the modern reader in the precise shape in which it left Paul and his contemporaries. Opinions, misunderstandings, misapprehensions, have kept the last and least essential parts of this epistle whole, and so it is by 25–27 that the reader is introduced to the bearers of the larger epistle. The point of such hypotheses is to explain how the note came to be attached to Romans, but this theory is no improvement upon that of Semler. Since xvi. 23 is one of the last chapters written by Paul, and not before, it is a point in favor of the hypothesis that the whole xvi. 25–27 has been added by Paul as a postscript, or it is unauthentic.4 Due to some copyist who added it as

1 Erbes (Zeitschrift für Kirchengeschichte, 1901, 234–231) makes xvi. 1–20 a note forwarded by Paul to Rome during his last voyage thither, in order to advise some of the local Christians of his arrival (Acts xxvii. 13), but this theory is no improvement upon that of Semler. Since xvi. 23 is one of the last chapters written by Paul, and not before, it is a point in favor of the hypothesis that the whole xvi. 25–27 has been added by Paul as a postscript, or it is unauthentic.5 Due to some copyist who added it at

2 The uncertainty as to the literary structure of the epistle naturally renders it hazardous to infer the character of the Christians who are addressed, but it may be said that the results of the long debate on this point are converging upon the belief that the predominant class in the local church or churches were Gentile Christians, while proselytes must have swelled the ranks to an inconsiderable degree. Since Weizäcker wrote, the older view of Baur (cf. his Paul, Eng. tr. i. pp. 321 f.) has steadily lost ground. Zahn is now its main supporter, and his contentions are not convincing. Even were ix.–xi. taken as the kernel of the epistle, its obvious motive is to be found in the need of explaining to Gentile Christians the reasons for Israel's apparent rejection, and passages like i. 5 f., 13, xi. 13, xv. 15 f., are, if not decisive, at any rate superior to any references which can be urged fairly on the opposite side. To a church of this kind, in the capital of the Empire, Paul writes on his gospel more fully than in any other of his extant writings. There is the same essential difference between the gospel that he treats, and that is the revelation of God's righteousness to man by faith in Jesus Christ. Neither sacraments nor organization come within his purview. Even eschatology lies quite in the background. Paul writes of the inspired " (Denney, p. 582). Proofs of his Pauline authorship are led fully by Zahn (Einleitung in das N.T. § 21 f.) and Jacquier (Histoire des livres du N.T., 1903, 271 f.): cf. also Bacon in Journal of Biblical Literature (1899), pp. 184 f. The entire data of xv.–xvi. are discussed fully by Lightfoot and Hort, in the former's Biblical Essays (pp. 285 f.) and in the latter's admirable volume (Romans and Ephesians), as well as in Scandinavia and Helm's edition (pp. lxxxv. f.).

3 Journal of Biblical Literature, 1898, pp. 184 f.) suggests that xv.–xvi. 24 form a letter or part of a letter written not by Paul but by his amanuensis, Tertius, to his friends at Rome, c. A.D. 64, previous to the Neronian persecution.

4 Weizäcker, Weitere Untersuchungen über den Paulusbriefe (1897, pp. 182 f.), as well as those who, like Renan (p. Paul, late 18–20) failing in their interpretation, have held that the spirit of this epistle is the same as that of the Roman one (xvi. 23), the latter being, like Ephesians, a circular epistle.

5 The epistle was so systematic in treatment and wide in scope that it lent itself readily to this catholicizing "manipulation; that is to say, it was possible to arrange the arguments and materials, without any great introduction, into a series of chapters, of which the particular points may be found in their original order. The same tradition may be due to their fullness of local detail, which would have less interest for the later church. But the question of course arises, May not the epistle, in whole or in part, have originally been more of a treatise in epistolary form than it appears? For various suggestions as to the problems set by this letter: it is possible that the question of i. 7 see in Harnack in Zeitschrift für die neutest. Wissenschaft (1902), 83–86; R. Steinmetz (ibid., 1905, 177 f.); and Schmiedel in Hibbert Journal (1903), pp. 537 f.
heart of the gospel with all his heart, and while a certain controversial element inevitably enters into his exposition—since he is writing with his eye on the Roman Church—any such considerations are quite subordinate to his dominative aim.

The epistle dates itself. Paul is on his way to Jerusalem with the moneys collected from the Macedonian and Achaian churches (xv. 19–32), and, after his visit to the Jewish capital, he proposes to visit the church of Rome on route for a mission in Spain. The situation corresponds to that outlined in Acts xx. 2–3. Paul probably despatched the epistle from Corinth. This conclusion would be put almost beyond doubt were Rom. xvi. regarded as an integral part of the original epistle, since in that case Timothy and Sosipater (xvi. 21) would be with Paul as in Acts xx. 4, like Gaius (xvi. 23) and Erastus, both of whom were Corinthians (1 Cor. i. 24; 2 Tim. iv. 20). Pheobe of Cenchreae, the seaport of Corinth, would also be the bearer of the epistle (xvi. 1). But even apart from the nature of ch. xvi. the tone of the epistle (especially of xv. 19 f.) indicates that Paul regards his work in the eastern provinces as done, and now turns to the West.

It is just possible, of course, that the epistle was written from some other town, perhaps in Illyricum (so H. E. G. Paulus), but the facilities of communication point to Corinth.

**LITERATURE.**—The ablest recent editions of the Greek text have been those of B. Weiss (in Meyer’s commentary, 9th ed. 1899, thorough and all-round), R. A. Lipsius (Hand-Commentar, 2nd ed. 1892), H. Oltramare (Paris, 1881–82), Sanday and Headlam (in Westcott and Hort’s Text, critical and external criticism), and Denney (Espositoro’s Greek Testament, 1901, a masterpiece of theological exposition), to which the Roman Catholic commentators of A. Schäfer (Münster, 1891) and Cornely (Paris, 1898) may be added. The paternal and devotional commentary is summarized by Sanday and Headlam (op. cit. pp. xxviii.), and a conspectus of the last vast work may be found in W. F. Dickson’s translation of Meyer (Edinburgh, 1873–74). The edition of G. H. A. Plummer’s, 3rd ed. of Graf’s (1879–80, Eng. trans. 1888), E. H. Gifford (Speaker’s Commentary, 1889) and Philippi (4th ed. Frankfort, 1896) are of special theological value, Gifford’s for its delicate exegesis and Gifford’s for its adequate location of the passage from its context. From the text, the 9th ed. of Delitzsch’s Brief an die Römer aus dem griech. Utext in das Hebräische übersetzt, and aus Talmod und Midrasch erlautert (1870), with which may be classed the earlier works of Reiche (Versuch einer ausführlichen Erklärung, 4 vols., 1863–73) and C. F. A. Fritzsche (1864–65). Since Dearborn (1852), the freshest English editors have been Dr David Brown (Glasgow, 1860), Moule (Cambridge Bible, 1879), C. J. Vaughan (7th ed. 1880), B. Jowett (3rd ed. 1894), J. Agar Beet (9th ed. 1901), and Delitzsch’s Des Römerbriefs in Des Schriften des N. T. (1897), though written from a different standpoint, resemble Delannoy’s in their conciseness and penetration. Lietzmann’s edition, again, is slight and philological (Handbuch zum Neuen Testament, 3 vols., 1902–07). Lightfoot’s works on Epistles of St Paul, 1895, pp. 257–302 unfortunately breaks off at vii. 25. In addition to the special monographs already noted in the course of this article, the essays of H. E. G. Paulus (De originebus Pauli epist. ad Rom., Jena, 1801), Lorenz (Der Römerbrief, 1884), Grafe (Über Veranlassung und Zweck des R., 1881), G. B. Stevens (The Pauline Theology, 1894), Feine (Der Römerbrief, 1903) and A. Robertson (Hastings’s Dict. of Bible, iv. 356–360) may be consulted. The most remarkable monograph of recent years is Semer’s monograph, Il pensiero di S. Paolo nella lettera ai Romani (Rome, 1903). Holsten’s position is stated in a series of articles in the Jahrbuch für protest. Theologie (1879, pp. 95 f., 314 f., 680 f., Pfleiderer in Das Urchristentum (and ed. i. 149 f., Eng. tr. Primitive Christianity, i. pp. 211 f.) and Hilgenfeld’s in his own Zeitschrift für die wissenschaft. Theologie (1892), pp. 296–347. The recent literary and historical discussions are chronicled in C. Clemen’s Paulus, i. 86 f., ii. 286 f., in which the English reader may compare R. L. Hind’s The Testimony of St Paul to Christ (1905), pp. 60 f.

---

**ROMANSHORN—ROMANUS**

**ROMANSHORN,** an important commercial town in the Swiss canton of Thurgau. It is situated on the west shore of the lake of Constance, and by rail is 513 m. N.E. of Zürich, 124 m. S.E. of Constance, and 10 m. N.W. of Rorschach. In 1900 its population was 4577, mostly German-speaking, while there were 3093 Protestants to 1478 Romanists. Originally a small fishing village, it belonged to the abbot of St. Gall from 1212 to 1429, when it became part of the canton of Thurgau. In 1856 the railway from Romanshorn to Zürich was opened, and this vastly increased the commercial importance of Romanshorn. Nowadays it is the centre of a great transit trade, as it communicates, by means of the lake, with the principal towns on its shores. The corn trade and that in timber are among the most important, while there are many industrial establishments. It is essentially a modern commercial centre.

**ROMANUS,** the name of four East Roman emperors.

1. Romanus I. (Lecapenus), who shared the imperial throne with Constantine VII. (967–976) and exercised all the real power from 919 to 944, was admiral of the Byzantine fleet on the Danube when, hearing of the defeat of the army at Aheoules (917), he resolved to sail for Constantinople. After the marriage of his daughter Helena to Constantine he was first proclaimed basileus (919) and then, after crowned colleague of his son-in-law, his reign, which was uneventful, except for an attempt to check the accumulation of landed property, was terminated by his own sons, Stephen and Constantine, who in 944 carried him off to the island of Prote and compelled him to become a monk. He died in 948.

2. Romanus II. succeeded his father Constantine VII. in 959 at the age of twenty-one, and died—poisoned, it was believed, by his wife, Theophano—in 963. He was a pleasure-loving sovereign, but showed judgment in the selection of his ministers. The great event of his reign was the conquest of Crete by Nicophilos Phocas.

3. Romanus III. (Argyurus), emperor 1028–1034, was an undistinguished Byzantine patrician, who was compelled by the dying emperor Constantine IX. to marry his daughter Zoe and to become his successor. He showed great eagerness to make his mark as a ruler, but was mostly unfortunate in his attempts to become a great Roman emperor. He was the last of the emperors to use the title of basileus, and the last to style himself a Romanus. His reign was marked by serious financial difficulties, which in his endeavor to relieve the pressure of taxation disorganized the finances of the state. In 1030 he resolved to retaliate upon the incursions of the Moslems on the eastern frontier by leading a large army in person against Aleppo, but by allowing himself to be surprised on the march sustained a serious defeat at Azaz near Antioch. Though this disaster was retrieved by the successful defence of Edessa by George Maniates and by the defeat of a Saracen fleet in the Adriatic, Romanus never recovered his popularity. His early death was supposed to have been due to poison administered by his wife.

4. Romanus IV. (Diogenes), emperor 1068–1071, was a member of a distinguished Cappadocian family, and had risen to distinction in the army, when he was convicted of treason against the sons of Constantine X. While waiting execution he was summoned into the presence of the empress regent, Eudocia Macrembolitissa, whom he so fascinated that she granted him a free pardon and shortly afterwards married him. After his coronation he carried on three successful campaigns against the Saracens and Seljuk Turks, whom he drove beyond the Euphrates; in a fourth he was disastrously defeated by Alp Arslan on the banks of the Araxes and taken prisoner. After releasing himself by the promise of a large ransom and the conclusion of a peace, he turned his arms against the
prentier Michael VII., but was compelled after a defeat to resign the empire and retire to the island of Proje, where he soon died in great misery. It was during this reign that, by the surrender of Bar (1071), the Byzantine empire lost its last hold upon Italy.

ROME (Roma), the capital of the modern kingdom of Italy, in the province of Rome, on the river Tiber, 17 miles N.E. from its mouth on the Mediterranean. As formerly the centre of the ancient Roman republic and of the Roman empire, and the headquarters of the Christian Church, Rome is unique among historical cities, and its antiquarian interest far surpasses that of any other locality in the world. In the following account the general subject of Rome is treated broadly under two aspects, themselves subdivided. These are:—(1) the topography and growth of the city of Rome, the evolution of which is traced from the earliest times to the present, and (2) Roman history, i.e. the political and social history of the Roman republic, empire and medieval commune.

The nine or ten hills and ridges on which the city stands are formed of masses of tufa or conglomerated sand and ashes thrown out by neighbouring volcanoes now extinct, but active down to a very recent period. One group of these volcanoes is that around Lago Bracciano, while another, still nearer to Rome, forms the Alban Hills. That some at least of these craters have been in a state of activity at no very distant period has been shown by the discovery at many places of broken pottery and bronze implements below the strata of tufa or other volcanic deposits. Tracks of human life have even been found below that great flood of lava which, issuing from the Alban Hills, flowed towards the site of Rome, only stopping about 3 miles short, by the tomb of Cecilia Metella.

The superficial strata on which Rome is built are of three main kinds: (1) the plains and valleys on the left bank of the Tiber are covered, as it were, by a sea of alluvial débris, in the midst of which (2) the hills of volcanic origin rise like so many islands, and (3) on the right bank of the Tiber, around the Janiculan and Vatican Hills, are extensive remains of an ancient seashore, conspicuous in some places by its fine golden sand and its deposits of broken white pottery's. Clay. From its yellow sand the Janiculan has been sometimes known as the Golden Hill, a name which survives in the church on its summit called S. Pietro in Montorio (Monte d'Oro). In addition to these three chief deposits, at a few places, especially in the Aventine and Pincian Hills, under-strata of travertine crop out—a hard limestone rock, once in solution in running water, and deposited gradually as the water lost its carbonic-acid solvent, a process still rapidly going on at Terni, Tivoli and other places in the neighbourhood. The conditions under which the tufa hills were formed have been very various, as is clearly seen by an examination of the rock at different places. The volcanic ashes and sand of which the tufa is composed appear in parts to lie just as they were showered down from the crater; in that case it shows but little sign of stratification, and consists wholly of igneous products. In parts time and pressure have bound together these scoriae into a soft and friable rock; in other places they still lie in loose sandy beds and can be dug out with the spade. Other masses of tufa again show signs either of having been deposited in water, or else of having been buried by their first resting-place and redeposited with visible stratifications; this is shown by the water-worn pebbles and chips of limestone rock, which form a conglomerate bound together by the volcanic ashes into a sort of natural cement. A third variety is that which exists on the Palatine Hill. Here the shower of red-hot ashes has evidently fallen on a thickly growing forest, and the burning wood, partly smothered by the ashes, has been converted into charcoal, large masses of which are embedded in the tufa rock. In some places charred branches of trees, their form well preserved, can be easily distinguished. The so-called "wall of Romulus" is built of this conglomerate of tufa and charred wood; a very perfect section of the branch of a tree is visible on one of the blocks by the Scala Cael.

So great have been the physical changes in the site of Rome since the first dawn of the historic period that it is difficult now to realize what its aspect once was. The Forum Romanum, the Velabrum, the great Campus Martius (now the most crowded part of modern Rome), and other valleys were once almost impassable marshes or pools of water (Ov. Fasti, vi. 401; Dionys. li. 50). The drainage of these valleys was effected by means of the great cloaca, which were among the earliest important architectural works of Rome (Varro, Ling. Lat. iv. 149). Again, the various hills and ridges were once more numerous and very much more abrupt than they are now. At an early period, when each hill was crowned by a separate village fort, the great object of the inhabitants was to increase the steepness of its cliffs and render access difficult. At a later time, when Rome was united under one government, the very physical peculiarities which had originally made its hills so populous, through their natural adaptability for defence, became extremely inconvenient in a united city, where architectural symmetry and splendour were above all things aimed at. Hence the most gigantic engineering works were undertaken: tops of hills were levelled, whole ridges were cut away and gentle slopes formed in the place of abrupt cliffs. The levelling of the Velian and the excavation of the site for Trajan's forum are instances of this. The same works were continued in the middle ages, as when in the 14th century an access was made to the Capitoline Arx from the side of the Campus Martius; up to that time a steep cliff had prevented all approach except from the side of the Forum.

Finally, after Rome had become the capital of united Italy, in the last quarter of the 10th century, an extensive government plan (piano regolatore) was gradually carried out, with the object of reducing hills and valley to a uniform level and constructing wide boulevards on the chessboard method of a modern American city. The constant fires which have at times devastated Rome have been a powerful agent in obliterating the natural contour of the ground; and the accumulated rubbish from this and other causes has in some places overlaid the ground to a depth of 40 ft., notably in the valleys.

THE ANCIENT CITY

The chief building materials used in ancient Rome may be enumerated as follows: (1) Tufa, the "ruber et nitrogen tepheus" of Vitruvius (li. 7), varying in colour from warm brown to yellow or greyish green (called copelaccio). The Aventine, Palatine and Capitoline Hills contained quarries of the tufa, much worked at an early period (see Liv. xxvi. 27, xxxix. 44, and Varro, L.L. iv. 151). It is a very bad "weather-stone," but stands well if protected with stucco (Plin. H.N. xxxvi. 166). (2) Lapis Albanus, from Alba Longa, of volcanic origin, a conglomerate of ashes, gravel and fragments of stone; its quarries are still worked at Albano and Marino. This is now called peperino, from the black scoriae, like peppercorns, with which the brown conglomerate mass is studded. (3) Lapis Gabinus, from Gabii, very similar to the last, but harder and a better weather-stone; it contains large lumps of broken lava, products of an earlier eruption, and small pieces of limestone. According to Tacitus (Ann. xv. 43), it is fire-proof, and this is also the case with the Alban stone. Lapis Gabinus is now called silex. (4) Siles (mod. silex), a lava from the now extinct volcanoes in the Alban Hills, used for paving roads; when broken into small pieces and mixed with lime and pozzolana it formed an immensely durable concrete. It is dark grey, very hard and breaks with a slightly conchoidal fracture (Plin. H.N. xxxvi. 135; Vitr. ii. 7), but does not resemble what is now called silex or flint. (5) Lapis Tiburtinus (travertine), the chief quarries of which are at Tibur (Tivoli) and other places along the river Anio; a hard pure carbonate of lime, of a creamy white colour, deposited from running or dripping water in a highly

1 By the great flight of marble steps up to S. Maria in Ara Coeli.
stratified form, with frequent cavities and fissures lined with crystals. As Vitruvius (ii. 5) says, it is a good weather-stone, but is soon calcined by fire. If laid horizontally it is very strong, but if set on end its crystalline structure is a great source of weakness, and it splits from end to end. Neglect on the part of Roman builders of this important precaution in many cases caused a complete failure in the structure. This was notably the case in the rostra. (6) Pulvis Puteolanus (pozzolana), so called from extensive beds of it at Puteoli—a volcanic product, which looks like red sandy earth, and lies in enormous beds under and round the city of Rome. When mixed with lime it forms a very strong hydraulic cement, of equal use in concrete, mortar or undercoats of stucco. It is to this material that the concrete walls of Rome owe their enormous strength and durability, in many cases far exceeding those of the most massive stone masonry. Vitruvius devotes a chapter (bk. ii. ch. 6) to this very important material.

Bricks were either sun-dried (latere crudit) or kiln-baked (latere cotit, testae). The remarks of Vitruvius (ii. 3) seem to wholly to sun-dried bricks, of which no examples now exist in Rome. It is important for the student of Roman brickwork to know that the existing ancient buildings of Rome there is no such thing as a brick wall or a brick arch in the true sense of the word; bricks were merely used as a facing to concrete walls and arches and have no constructional importance. Concrete (opus caementicium, Vitri. ii. 4, 6, 8), the most important of all the materials used, is made of rough pieces of stone, or of fragments of marble, brick, &c., averaging from about the size of a man's fist and embedded in cement made of lime and pozzolana—forming one solid mass of enormous strength and coherence. Stucco, cement and mortar (lectorium, opus albarium and other names) are of many kinds; the ancient Romans especially excelled in their manufacture. The cement used for lining the channels of aqueducts (opus signarium) was made of lime mixed with pounded brick or potsherd and pozzolana; the same mixture was used for floors under the "nucleus" or finer cement on which the mosaic or marble paving-slabs were bedded, and was called caementum ex testis linis. For walls, three or four courses of such stucco were used, often as much as 5 in. thick altogether; the lower coats were of lime and pozzolana, the finishing coats of powdered white marble (opus albarium) suitable to receive painting. Even marble buildings were usually coated with a thin layer of this fine white stucco, nearly as hard and durable as the marble itself—a practice also employed in the finest buildings of the Greeks—probably because it formed a more absorbent ground for coloured decoration; stone columns coated in this way were called "columnae dealbatae" (Cic. In Verr. ii. 1, 52 seq.). For the kinds of sand used in mortar and stucco, Vitruvius (ii. 4) mentions sea, pit and river sand, saying that pit sand is to be preferred.

Marble appears to have come into use about the beginning of the 1st century B.C. Its introduction was at first viewed with great jealousy, as savouring of Greek luxury. The orator Crassus was the first to use it in his house on the Palatine, (Cic. H.L. xxxvi. 7). The temporary wooden theatre of Agrippa, the theatre of Marcellus, built in 38 B.C., appears to have been the first building in which marble was more largely used; its 360 columns and the lower order of its seats were of Greek marble (see Plin. H.N. xxxvi. 5, 50). In a very few years, marble became very common.

Of white marble four principal varieties were used. (1) Marmor Lunense, from Luna, near the modern Carrara (Strabo, v. p. 222), is of many qualities, from the purest creamy white and the finest grain to the corner sorts disfigured with bluish grey streaks.

1 In less solid constructions than those which have survived until modern times bricks were doubtless used by themselves.

2 The oft-quoted boast of Augustus (Suet. Aug. 29) that he "found Rome of brick and left it of marble" has probably much truth in it, if for "brick" we read "peperino and tufa." In the time of Augustus burnt brick was very little used, the usual wall-facings being opus quadratum of tufa or peperino, and opus reticulatum of tufa only.

3 These Nile marbles were worked during the 19th century, and many blocks were imported into Rome for the rebuilding of S. Paolo fuori le Mura.

4 On the subject of Roman marbles, see Cori, Delles piu notabili (ed. 3, 1845), and Pullen, Handbook of Roman Marbles (London, 1894); and Brindley in Transactions of the Royal Institute of British Architects (1887). A collection of 1000 specimens, originally formed by Cori, is preserved in the museum at Oxford.
of the surface only) appear to be a principal item in the construction. The walls of the Pantheon, for example, are covered with tiers of brick arches, and many theories have been invented as to their use in distributing the weight of the walls. But a recognition of the fact that these walls are of concrete about 20 ft. thick, while the brick facings average scarcely 6 in. in thickness, clearly shows that these "relieving arches" have no more constructional use as far as concerns the pressure than if they were painted on the surface of the walls. The same applies to the superficial use of brick in all arches and vaults. Although, however, the setting of the concrete rendered the brick facing superfluous, it played its part in sustaining the fluid mass on its centring during the process of solidification.

At first tufa only was used in opus quadratum, as we see in the so-called wall of Romulus. Next the harder peperino began to be used, though sparingly, in the "Servian" wall, and during the later Republic appears to have been largely employed for exterior walls or points where there was heavy pressure, while other parts were built of tufa. Travertine appears to have been introduced about the 2nd century B.C., but was used at first merely for ornamental purposes very much as marble was under the Empire; after about the middle of the 1st century A.D. travertine began to be largely used for the main walls, as in the temple of Vesta and the Colosseum. The tufa or peperino blocks were roughly 2 (Roman) ft. thick in regular courses (the "iadomum" of Vitruvius) by 2 ft. across the end, and under the Republic often exactly 4 ft. long, so that two blocks set endways ranged with one set lengthways. They were arranged in alternate courses of headers and stretchers, so as to make a good bond; this is the "emplétion" of Vitruvius (ii. 8). The so-called Tabularium of the Capitol is a good example of this. The harder and more valuable travertine was not cut in this regular way, but pieces of all sizes were used, just as they happened to come from the quarry, in order to avoid waste: blocks as much as 15 by 8 ft. were and the courses varied in thickness—the "pseudoadomum" of Vitruvius. When tufa or peperino was mixed with the travertine, it was cut so as to range with the irregular courses of the latter.

It is interesting to note the manner in which the Roman builders mixed their material, according to the weight they had to carry. While tufa and travertine were kept separate for the main walls, peperino (e.g. in the "Servian" wall on the west front, and travertine (e.g. in the forum of Augustus and the temple of Fortuna Virilis, so called) was inserted at points of special pressure, such as piers or arches (see fig.). The Colosseum is a particularly elaborate example of this mixed construction with three degrees of pressure supported by three different materials.
Fig. 7.—PLAN OF ANCIENT ROME.
The Ancient City

Rome

The use of mortar with opus quadratum is a sign of a comparatively early date. It occurs, e.g. in the "Servian" wall on the Aventine and in the Tabularium. Under the Empire massive blocks, whether of tufa, travertine or marble, are set without any mortar. It must, however, be observed that in these early instances the "mortar" is but a thin stratum of lime, little thicker than stout paper, used not as a cement to bind the blocks together, but simply to give the joints a smoothly fitting surface. The actual bedding together was done by clamps and dowels, as well as by the mass and weight of the great blocks used. Except in the earliest masonry, each block was very carefully fastened, not only to the next blocks on the same course, which was done with double dowel-ended blocks of wood, but also to those above and below with stout iron clamps, run with lead (Vitr., ii. 8). 1 In some instances marble work bronze clamps were often used. Concrete is rarely found in connexion with opus quadratum; part of the "Servian" wall on the Aventine received a backing of concrete at a relatively late date, in the 1st century A.D. 2 2 By the 2nd century A.D. and in some cases even earlier, stamps impressed on bricks, and especially on the large tiles used for arches, gave clearer indications. The reason of the almost universal use of smooth facings either of opus reticulatum or of brick over concrete has been questioned; for concrete itself had an excellent ground for the stucco coating or backing to the marble slabs, while the stucco adheres with difficulty to a smooth facing, and is very liable to fall away. The modern practice of running out the joints for a key was not employed by the Romans, but before the mortar was hard they stamped the face of the wall with marble chips and iron or bronze nails driven into the joints, so as to give a hold for the stucco—a great waste both of labour and material. 4

The mortar varies both in quality of workmanship and size of the bricks often occur in work of the same date. In the remains of Nero's Golden House great varieties appear, and some of the walls in the interior rooms are faced with very irregular and careless brickwork. Special blocks were very rarely used in the rare cases when the wall was not to be covered with stucco, which in the absence of marble was usually spread over both inside and outside walls. All these circumstances make great caution necessary in judging of dates; fortunately the cast-work of walling is a very distinct feature of the 1st century, and in some cases even earlier, stamps impressed on bricks, and especially on the large tiles used for arches, gave clearer indications.

The quality of the mortar varies according to its date: during the 1st and 2nd centuries it is of remarkable hardness—made of lime with a mixture of coarse pozzolana of a bright red colour; in the 3rd century it began to be inferior in quality; and the pozzolana used under the later Empire is brown instead of red.

Concrete walls and vaults.

Concrete and brick faced walls were made of lumps of tufa; then travertine, lava, broken bricks and even marble were used, in fact all the chips and fragments of the mason's yard. Under the Empire the concrete used was made with travertine for foundations, and tufa and marble for walls, and with tufa or pumice-stone (for the sake of lightness) for vaults. Massive walls were cast in a mould; upright timbers, about 6 by 7 in. thick and 10 to 14 ft. long, were set in future wall; planks 9 to 10 in. wide were nailed to them, so as to form a core into which the liquid mass of stones, lime and pozzolana was poured. When this was set the timbers were removed and the wall was cast in this way and the brick facing omitted. In strength and durability timbers in the foundations of large buildings were lime or hard mortar, as the tufa and marble used were often hard from the quarry and the top of the concrete wall; then fresh concrete was poured in; and this process was repeated until the wall was raised to the required height. Usually such cast-work was only used for foundations. In the house at Liviae, the cella walls, the upper parts being faced with brick; but in some cases the whole wall to the top of the roof was cast in this way and the brick facing omitted. In strength and durability timbers in the foundations of large buildings were lime or hard mortar, as the tufa and marble used were often hard from the quarry and the top of the concrete wall; then fresh concrete was poured in; and this process was repeated until the wall was raised to the required height. Usually such cast-work was only used for foundations. In the house at Liviae, the wall faced with opus reticulatum must have been supported temporarily in the same way.

The character of the brick facing is a great help towards determining the date of Roman buildings. In early work the bricks are thick and the joints thin, with the result that the brickwork of the time of Severus and later has more bricks to the foot than that of the Flavian period. The length of the brick as it appears on the face is no guide to the date, since one or more of the sharp points of the brick triangles were frequently broken off before they were used. Moreover,

1 The expansion of the iron through rust, which caused the stone to split, has frequently been a great source of injury to Roman walls, as well as the practice, common in the middle ages, of breaking into the stones in order to extract the metal.

2 These two kinds of stone facings are mentioned thus by Vitruvius (ii. 8), "reticulatum, quo nunc [reign of Augustus] omnes utuntur, et antiquum, quod incertum dicitur."

3 Some of the bricks are as much as 23 in. thick, while 14 in. is the usual maximum for Roman bricks.

4 The Roman method of applying stucco to walls with a wooden float exactly as done now, is shown in a painting from Pompeii (see Ann., Inst., 1881, pl. H.).

Fig. 2.—Concrete Wall, faced with (A) opus reticulatum. C, C, the section, similar in both.

The character of the brick facing is a great help towards determining the date of Roman buildings. In early work the bricks are thick and the joints thin, with the result that the brickwork of the time of Severus and later has more bricks to the foot than that of the Flavian period.

The length of the brick as it appears on the face is no guide to the date, since one or more of the sharp points of the brick triangles were frequently broken off before they were used. Moreover,
building acts, not unlike those of modern London, were enacted by several of the emperors. These fixed the materials to be used, thickness of walls, minimum width of streets, maximum height allowed for houses, &c. After the great fire in Nero's reign, A.D. 64, an act was passed requiring the lower storeys of houses to be built with fire-proof materials, such as peperino or burnt brick.

Enormous accumulations of statues and pictures enriched Rome during its period of greatest splendour. In the first place, the numerous statues of the republican and even of the regal period were religiously preserved; but a time came when their archaic character, they must have been regarded rather as objects of sacred or archaeological interest than as works of art (Plin. H. N. xxxiv. 15 ff., xxxv. 19 ff.). Secondly came the large Graeco-Roman class, mostly copies of earlier works, executed in Rome by Greek artists. To this class belongs most of the finest existing sculpture preserved in the Vatican and other museums. Thirdly, countless statues and pictures were stolen from almost every important city in Greece, Magna Graecia, Sicily, and western Asia Minor. These robberies began early, and were carried on for many centuries. The importations included works of art by all the chief artists from the 5th century downwards. Long lists are given by Pliny (H. N. xxxii., xxxvi.), and pedestals exist with the names of Praxiteles, Timarchus, Polyclitus, Bryaxis, and others. These accumulated works of sculpture were of all materials—gold and ivory (Suet. Tit. 2), of which seventy-four are mentioned in the catalogue of the Breviariurn, many hundreds or even thousands of silver1 (Plin. H. N. xxxiv. 151). All of those of gilt bronze and marble must have existed in almost untold numbers (Paus. viii. 46). Nor were the accumulated stores of Greek paintings much inferior in number; not only were easel pictures by Zeuxis, Apelles, Timanthes and others (see n. 2 above) taken, but even mural paintings were carefully cut off their walls and brought to Rome secured in wooden frames (Plin. H. N. xxxv. 173, and compare ibid. 154).

The roads were made of polygonal blocks of lava (siles), neatly fitted together and laid on a carefully prepared bed, similar to that used for mosaic paving (see MOSAIC and ROADS). Roads thus made were called viae stratae. A good specimen of Roman road-making, in which the blocks were fitted together with the utmost accuracy, is to be seen in a portion of the Clivus Capitolinus in front of the temple of Saturn (see fig. 5, which also shows the massive travertine curb which bordered the road; sometimes the curb was of lava). In 1901 the late and badly laid pavement of the Sacra Via, on the ascent of the Velia was removed, and the earlier paving laid bare at a lower level. The original pavement of the Nova Via was exposed in 1904. Other well-preserved viae stratae are those leading up to the Palatine from the Summa Sacra Via and that which follows the curved line of shops in Trajan's forum.

The following is a list of the chief roads which radiated from Rome:—(1) Via Appia issued from the Servian Porta Capena and the Aurelian P. Appia; from it diverged (2) Via Latina, which issued from the Aurelian P. Appia and was cut off from the Servian P. Esquilia; (3) Via Praenestina at the double arch of the Claudian aqueduct, now P. Maggiore, while (4) passed through the Aurelian P. Tiburtina; (5) Via Nomentana and (7) Via Salaria issued from the Servian P. Coturn and passed respectively through the Aurelian P. Nomentana and P. Salaria; (8) Via Flaminia issued from the Servian P. Fontinalis, and was called Via Latina for the first half-mile or more, then passed through the Aurelian P. Flaminia; (9) Via Aurelia, from the Transtiberine P. Aurelia; (10) Via Portuensis, from the Transtiberine P. Portuensis; (11) Via Ostiensis, from the Servian P. Trigemina and the Aurelian P. Ostiensis; (12) Via Ardeatina, from the Servian P. Naevia and the Aurelian P. Ardeatina.

Remains of Prehistoric Rome.

It is evident from recent discoveries that the site of Rome was inhabited at a very early period.2 Flint implements and remains of the Bronze Age have been found on the Aventine and elsewhere; and from the Early Iron Age onwards we have a continuous archaeological record, owing to the discovery of ancient burial-places. In 1902 a very early necropolis was brought to light at the S.E. corner of the temple of Antoninus and Faustina, some 17 ft. below the level of the Forum. The graves contain either the ashes of cremated bodies placed in a large vessel (dolio), or skeletons buried either in a simple trench ( fossa), a tufa sarcophagus or a tree-trunk. The cremation graves are the earlier, and none are later than the 6th century, while the oldest may be of the 9th; the pottery and other objects placed in the graves belong to the Early Iron Age. It is clear that this cemetery is earlier than the union of the Palatine and Quirinal settlements in one city (see below, p. 759). Other early cemeteries have been discovered on the Quirinal and the Palatine, where a tumulus of the beginning of the Iron Age, down to the beginning of the historic period, the large necropolis on the Esquiline is cut in two by the "Servian" wall, which is evidently of later date. The later tombs contain objects of Etruscan, Phoenician and Greek manufacture.

There is no doubt that the earliest settlement bearing the name of Rome was on the Palatine hill,3 which was both easy of defence and possessed the means of communication with its neighbours in the proximity of the river Tiber. The name Roma is said to mean "river," but this is uncertain. The Palatine is roughly square in outline, and the Roman antiquarians sometimes applied the name Roma Quadrata to the earliest settlement; but the term seems more properly to have applied to a sanctuary connected with the foundation of the city. The ideal boundary of the city was formed by the Pomerium (see Varro, L.L. v. 143; Liv. i. 44; Dionys. i. 88), whose original course is traced by Tacitus (Ann. xii. 24). It passed along the foot of the hill (per imas montis Palatini), the angle-points being given by the Ara Curae and the confluence of the Aurelian and Tiburtina in the Circus Maximus, the Curiae Veteres (near the arch of Constantine) and the Sacellum Larum (at the N. angle). But this was of course not a defensible site, and the extent of the fortified city could only be determined by the traces of its early walls. These enabled us to fix its line along the whole valley of the Velabrum, on the west of the hill, and along the valley of the Circus Maximus as far as the so-called Paedagogium, about the south side.

Considerable remains of this fortification exist near the west angle of the hill. These show that the natural strength given by the cliff was increased by artificial means. The wall was set back at the top of the hill, a shoulder formed by cutting down more than half-way up, a level terrace or shelf all round being cut in the rock on which the base of the wall stood. Above that the hill was cut away into a cliff, not quite perpendicular but slightly battered on the side (this is not the case. Tufa does not split into rectangular masses, but...
would be shattered to pieces by a wedge; moreover, distinct tool-marks can be seen on all the blocks whose surface is well preserved and in the quarries themselves. Chisels from one-fourth to three-fourths of an inch in width were used, and also a sharp-pointed pick or hammer. The wall is about 10 ft. thick at the bottom, and increased in thickness as it ascended to the top. The vertical jointing is worked true and close like the beds. No mortar was used. At the base of the flutings of the wall, which was excavated in the tufa cliff, the entrance to which was once closed by the ancient wall. One of these in earlier times (before water was brought to the Palatine on aqueducts) was used as a reservoir to collect surface water, probably for use in case of siege; circumscribed in this fashion, in width than those of the main wall. A few courses have been preserved, owing to the fact that at the angle of the hill this wall was encased first of all by that described above and afterwards by concrete substructures of imperial date. The technique is peculiar—of great size and irregular in the open vertical joints found in some cases; but too much stress should not be laid on this feature. The western angle of the hill some remains of an earlier fortification, conjectured, is still seen. A line of buildings of the later years of the Republic and the early Empire, to make room for which the greater part of the then useless wall was pulled down, and only fragments left here and there, where they could be worked into the walls of the later house.

The age of the walls here described cannot be determined with certainty, but their resemblance to the remains of the "Servian" wall, especially in the system of "headers and stretchers" and the dimensions of the blocks, makes it certain that they do not differ greatly in age. Work in the open vertical joints found in some cases; but too much stress should not be laid on this feature. traversed by the fortification. Where the wall followed the face of the cliffs, as for instance on the Capitol and Quirinal, it was raised on an artificial shelf after the fashion employed on the Palatine (nida); in other places, where the slope was gentler, the wall was formed of rubble with revetment in front. The wall on the Aventine; finally, where the ground was flat, as on the plateau of the Esquiline, a ditch was dug and an embankment formed for the upper part of the wall, as it was called, was then faced with retaining walls of opus quadratum. The length of the Esquiline portion of the wall is put by Dionysius (ix. 68) at 7 stadia, which agrees, roughly speaking, with the discoveries made in 1876-1879, when the railway station and the Dogana a fane lofty piece of the front wall remains, with traces of the Porta Viminalis and of the lower back wall. Unfortunately the whole of the area under the agger proper has been removed, and the blocks of the great retaining wall exposed. Both tufa and peperino are used, the latter in restored parts; the blocks vary in length, but average in depth the usual 2 Roman ft. The railway cutting, which has destroyed a great part of the agger, shows clearly the layer of the whole work: the strata of different kinds of soil which appeared on the sides of the foss appeared again in the agger, as reversed they were in the cutting; and the agger being dug out and heaping up. Dionysius (ix. 68) states the length of the agger line was about 7 stadia—i.e., about 1400 yds.—which agrees (roughly speaking) with the actual discoveries. Originally one road ran along the bottom of the ditch, and another along its edge; the latter existed in 300 B.C. But the whole line of road was supposed to have been by 50 B.C. probably in the time of Augustus, and afterwards built up; houses of mixed brick and opus reticulatum still exist against the outer wall of the great wall, which was itself used as the back wall of these houses, as well as the agger. The 4th century walls of the agger itself have been. Hadrian covering parts of the wall of the kings. Another row of houses seems to have faced the road mentioned above as running along the upper edge of the foss, thus forming a long street. As early as the time of Dionysius (iv. 13) a very curious series marks of masons' marks is on stones of the agger wall (as well as on those of the Esquiline and the Quirinal), and it has been shown by Krahe (Studien zur romischen Architektur) that these marks are deep incised, usually on the ends of the blocks, back average from 10 to 14 in. in length; some are single letters or monograms; others are numbers, e.g., 1. The numeral 50. Fig. 6 shows the chief forms of masons' marks on the Esquiline and Esquiline.

There are also extensively remains of the Servian Wall on the Aventine, in the Via di Porta S. Paolo. Here the wall has a large arch, the lintel of which is the original, and the upper portion is built with blocks of peperino, set in a bed of tufa, and Hedrinus a wall of peperino, and is probably later than the rest of the fortification.

The age of this wall is uncertain, but it has been rendered exceedingly probable that it belongs to the 4th century B.C. The evidence for this is derived from the Servian Wall in central Italy, from the measurements of the Servian Wall in central Italy, which presuppose the latter Roman foot of 296 millimetres, and from the character of the alphabet from which the masons' marks are taken. It is likely that this contract entered into by the Servian Wall was used as a model, prisoners being lowered through a hole in the wall for the first time. The present stairs are modern. The two chambers are vividly described by Sallust (Cat. xxv. The entrance to the upper prison from the stairs leading up from the Forum to the Clivus Argentarius, the roadway of the Porta Fontinalis in the Forum of Servian Wall on the Aventine.)

The Servian city did not include what is now the most crowded part of Rome, and which under the Empire was spectacu-
larly magnificent, namely, the Campus Martius, which was probably to a great extent a marsh. It was once called Agri Tarquinius, but the name of the street of the Tarquins was named Campus Martius from an altar to Mars, 1900, iv. 370, 380.

Of that wonderful system of massive arches sewers 4 which, as Dionysius (i. 68) says, every street of Rome was drained into the Tiber, considerable remains exist, especially of the Cloaca Maxima, which ran along the Forum road, under the Forum of Aug.

4 Great quay wall with arched cloacae in style to those in Rome, exists at the mouth of the river Marta near Tarquinii, and similar constructions are found in other Etruscan cities.

4 Livy (ii. 29) mentions the "media urbe immittens foro," and also speaks (xxvii. 64), of an "inferorem carcerem," and at xxii. 22 a criminal being put in the Tullianum.

5 Consules sufficii for A.D. 22.
the bodies of criminals were exposed; 1 Pliny (H. N. viii. 145) calls it the "stairs of sighs" (gradus gemitorum).

Forum Romanum and Adjacent Buildings.

The Forum Romanum or Magnum, as it was called in late times, to distinguish it from the imperial fora, occupies a valley which extends from the foot of the Capitoline hill to the north-west part of the Palatine. Till the construction of the great cloaca it was, at least in wet seasons, marshy ground, in which were several pools of water. In early times it was bounded on two sides by rows of shops and houses, dating from the time of the first Tarquin (Liv. i. 35). The shops on the south-west side facing the Sacra Via, where the Basilica Julia afterwards was built, were occupied by the Tabernae Veteres. 2 The shops on the northern side, being occupied by silversmiths, when rebuilt after a fire, were called Tabernae Novae (see Liv. xxvii. 27, xii. 51). An altar to Saturn (Dionys. i. 34, vi. 1), traditionally set up by the companions of Hercules, and an altar to Vulcan, both at the end towards the Capitol, with the temple of Vesta and the Regia at the opposite end, were among the earliest monuments grouped around the Forum. The Lacus Curtius vanished, as Varro says (L.L. v. 148-49), probably with other stagnant pools, when the cloaca were constructed (Liv. i. 38, 56). Another pool, the Lacus Servilius, near the Basilica Julia, was preserved in some form or other till the imperial times. Unfortuitously this place was, in the heyday of many senators murdered in his proscriptions (Cic. Rusc. Am. 32, 80; Seneca, De Prosp. 3, 7). The Volcanal was an open area, so called from the early altar to Vulcan, and was (like the Comitium) a place of public meeting, at least during the regal period. It was raised above the Comitium, and was a space levelled on the lower slope of the Capitoline hill behind the arch of Severus; the foundations of the altar were discovered in 1898. It was probably much encroached upon when the temple of Concord was enlarged in the reign of Augustus. Fig. 8 gives a carefully measured plan of the Forum, showing the most recent discoveries.

Unlike the fora of the emperors, each of which was surrounded by a lofty wall and built at one time from one design, the architectural form of the Forum Romanum was a slow growth. The marly battlements of the early inhabitants of the Capitol and Palatine became, when the ground was drained by the great cloaca, under a united rule the most convenient site for political meetings, for commercial transactions, and for the pageants of rich men's funerals, triumphs, and other gladiatorial spectacles. 3 For these purposes a central space, though but a small one, was kept clear of buildings; but it was gradually occupied in a somewhat inconvenient manner by an ever-improving crowd of statues and other honorary monuments. On three sides the limits of this open space are marked by paths leading to the stately buildings which encircled it; on the fourth side, the place of the simple wooden tabernae and porticus of early times. The Comitium 4 was a level space in front of the Curia; the construction of both is ascribed to Tullus Hostilius. For the position of the Comitium and the Curia 5 see plan of Forum (fig. 8). Varro (L.L. v. 155-56) gives the following account of the buildings which were grouped along the northern angle of the Forum:

"Comitium ab eo quod cobant eo comitis curialis et litium causa. Curiae duorum generum, nam et ubi curarent sacerdotes ros divinas, ut Curiae Veteres, et ubi senatorius humanas, ut Curia Hostilia, quod primum aedificavit Hostilius rex. Ante hanc Rostra; quoios loci id vocabulum, quo ex hostibus capita fixa sunt rostra. Sub dextra hujus a Comitio locus substructus, ubi nationum subsisterent leges, sed per saecula in senatus constituunt; illa est a parte utra. Semucalum supra Graecostasim, ubi Aeides Concordiae et Basilica Opimia. Semucalum vocatum, ubi senatorius, aut seniores consistentiae.

The curia or senate house passed through many vicissitudes. At first called Curia Hostilia, from its founder Tullus Hostilius (Liv. i. 30), it lasted till 32 B.C., when it was burnt at the funeral of Cilius, and was then rebuilt by Faustus Sulla, and from his gens called Curia Cornelia (Dio Cass. xi. 50). It was again rebuilt by Julius Caesar, and dedicated by Augustus (29 B.C.) under the name of the Curia Julia, as recorded in the inscription of Ancyr (q.v.— CIVRIAM, ET, CONTINENS, EJ, CHALCIDICVM... FECl. Little is known about the adjoining buildings called the Ad Latinae Curiae, with the lower story of a temple and the upper with the Curia Julia. In the reign of Domitian the Curia Julia was restored (Prop. Auct. p. 571), and it was finally rebuilt by Diocletian. The existing church of S. Adria is the Curia of Diocletian, though of course much altered, and with its roof raised about 20 ft. above the level. The present building, the church of S. Adrian, was the work of Pope Honorius I. (A.D. 625-38) who consecrated it as the church of S. Adrian.

From the Curia a flight of steps led down to the Comitium (Liv. i. 36) and the meeting place connected with the sanctuary of asury (Cic. De Or. iii. 3) and used for the meetings of the Comitia Curiata, and for certain religious ceremonies performed, after the fall of the monarchy, by the rex sacrificus. It contained ancient monuments, relics, such as the jactae muralis, and the sacred bosom of the god. The shaded enclosure was divided into laterites by a "black stone" (lapis niger). Facing the Curia stood the platform from which speakers addressed the people, adorned in 335 B.C. with the beaks of the ships captured from the Latins at the naval victory of Tarentum; the arch of Hadrian, which now adorned the rostra. Caesar determined to remove the rostra from the Comitium to the Forum, and this plan was carried out after his murder. From the original Curia Cicero delivered his Second and Third Catilina Orations, and they were the scene of the scenes of the parliaments of Rome, such as the enunciation of their laws by the Gracchi. Beside the Comitium another monument was erected, also adorned with beaks of ships, to commemorate the same victory at Antium. This is the Columna Maeniana, called in (Plin. H. N. xvi. 212). The Columna Dulia was a similar monument, erected in honour of the victory of C. Dullius over the Punic fleet in 260 B.C.; a fragment of it with its inscription (restored in imperial times) is preserved in the Capitoline Museum. Monuments such as these were called columnae rostratae.

In 1899-1900 the site of the Comitium—which was considerably reduced in extent by the building of the later Curia—was excavated by Commendatore Boni, in some parts as far as the virgin soil. Remains of walls and pavements of various periods (some very early) were discovered; some of the walls, there is no doubt, supported the platform of the early rostra, which appears to have been at first rectangular and at a later time curved. Opposite to the Curia was a square, bounded with black marble slabs, which it is quite possible is natural to identify with the lapis niger of tradition. Beneath this pavement was found a group of early monuments, which were at some time destroyed and afterwards covered over. We are told on the authority of Varro that Romulus was buried in the site of (or near) the Curia Julia, and was provided as guardian of his tomb; and we find in fact a foundation (D. f. 9) from which projected two moulded bases of tufa (A, B) on which the lions may well have stood, on either side of a block (C) which might have held the statue of Romulus. The true diameter of a tufa column (E) and a rectangular stile (F) which bears on all its faces an inscription written alternately upwards and downwards, so that only the ends of the lines can be read. That it is the earliest spectator of the Augustan paintings is certainly discussed.

In 1899 the expulsion of the kings the res in

1 On the Curia and its vicissitudes see Lanciani, L'Aula e gli Uffici del Senato Romano (1883).

2 The column itself is a copy made by Michelangelo, but it is at the foot of the stairs of the Palazzo dei Conservatori.

3 The discoveries of Comm. Boni have given rise to much discussion. Of the numerous articles, &c., which have appeared it will suffice to name Petersen, Comitium, Rostra, Grab des Romulus (1904), and Pliny, History of Rome repubblicana (1905); see Hueslen, The Roman Forum, pp. 110 ff.
sacrificulus performed his functions in the Comitium, and the inscription may refer to him. This may be the stele to which Dionysius of Halicarnassus refers as marking the tomb of Hostus Hostilius (father of Tullus Hostilius) whose site (according to those who believed in the translation of Romulus to heaven) was marked by the lapis niger.

The Senaculum appears to have been a place of preliminary meeting for the senate before entering the Curia (Liv. xli. 27; Val. Max. ii. 2, 6); it adjoined the temple of Concord, and when this was rebuilt on an enlarged scale in the reign of Augustus it appears probable that its large projecting portico became the Senaculum.

A great part of the north-east side of the Forum was occupied by two basilicas, which were more than once rebuilt under different names. The first of these appears to have been adjacent to the Curia, on its west side; it was called the Basilica Forcia, and was founded by the elder Cato in 188 B.C. (see Liv. xxxix. 44, and Plut. Cat. Maj. 19); it was burnt with the Curia at Clodius's funeral. On the north side of the Forum another basilica, called Aemilia et Fulvia (Varro vi. 4), was built in 179 B.C. by the censors M. Fulvius and M. Aemilius Lepidus; it stood, according to Livy (xli. 51), "post argentarias novas;" the line of silversmiths' shops along the north-east side of the Forum. In 50 B.C. it was rebuilt by L. Aemilius Paulus with Caesar's money (Plut. Cæs. 29; Appian, Bell. Civ. ii. 26), and was more than once restored within the few subsequent years by members of the same family. Its later name was the Basilica Pauli, and it was remarkable for its magnificent columns of Phrygian marble (Plin. H. N. xxxvi. 102) or pavonazzetto. Part of the western end was still standing in the 16th century, and was drawn by Giuliano da Sangallo (Huelsen, The Roman Forum, fig. 61). Recent excavations have shown that it was approached from the Forum by a flight of steps leading to a two-storied colonnade. Behind this was a row of tabernae in the middle of which was the entrance to the main hall, consisting in a nave and three aisles (two on the north side).

Near the middle of the north-east side of the Forum stood also the small bronze temple of Janus; the doors of which were shut on those rare occasions when Rome was at peace. A first brass of Nero shows it as a small cella, with richly ornamented frieze and cornice. Another aedicula near that of Janus was the shrine of Venus Cloacina (or the Purifier), on the line of the cloaca which runs under the Basilica Aemilia;

1 The Forum Piscatorium or fish-market appears to have been at the back of this basilica (see Liv. xli. 51).

2 The original temple was one of the prehistoric buildings attributed to Romulus and Tattius (Serv. Ad Aen. i. 291), or by Livy (i. 19) to Numa.

3 See Mon. Anc. 2, 42; Procop. Bell. Goth. i. 25; Liv. i. 19; Suet. Aug. 22.
and the Sacra Via.

its foundations and plinth were brought to light in 1899 (Liv. iii. 48; Plin. H. N. xxv. 119).

Fig. 1. Plan of the rostra as they existed under the Empire. We see an oblong platform about 78 ft. long and 11 ft. high above the level of the Forum; its ground floor, paved with herring-bone bricks, is 2 ft. 6 in. below the Forum paving. Its end and side walls are of five bricks, 2 ft. thick and 2 ft. wide, each carefully clamped to the next with wooden dovetail dowels. Its floor was supported by a series of travertine piers, carrying travertine lintels, on which the floor slabs rested. Outside it was faced with marble, and its plinth and cornice; the front wall was restored in 1904, and the fragments of the cornice replaced. A groove cut in the top of the cornice shows where marble cancelli were fixed; one of the cornice blocks is partly without this groove, showing that the screen did not extend along the whole front of the rostra. This agrees with a relief on the arch of Constantine, representing the emperor making an oration from the rostra, with other buildings at this end of the Forum shown behind. In this relief the screen is shown with a break in the middle, so that the orator, standing in the centre, was visible from head to foot. Two tiers of large holes to hold the bronze rostra are drilled right through the tufa wall, and even through the travertine pilasters where one happens to come in the way; these holes show that there were nineteen rostra in the lower tier, and twenty above set over the intermediate spaces of the lower row. The back wall of the rostra is of concrete faced with brick. The inside space, under the main floor of the rostra, is coated thickly with stucco—the brick wall being studied in the usual way with iron nails to form a key for the plaster.

Immediately behind the rostra is a curved platform approached by steps from the side facing the Capitol. It has been much disputed whether this platform is earlier or later than the rostra, but the evidence of the construction at the point of juncture seems to show that the hemicycle is the earlier. When the arch of Severus was built, part of the platform of the rostra was cut away and a court of irregular shape was thus formed, from which the rostra was approached by steps. The front wall of the hemicycle was now exposed in its eastern half; this was faced with slabs of para santa marble, pilasters of africanos, and a moulded plinth of white marble, whose blocks bear the Greek characters T, α, E, Z, Ὁ, Ξ; the omissions make it clear that the blocks were removed from some other building. A number of holes in the marble, some of which contain fragments of metal pins, show that bronze ornaments were at one time attached to the facing. The hemicycle has been identified (without sufficient reason) with the Lactaion, a platform near the rostra reserved for foreign embassies (Varro, L.L. v. 155; Cic. Q.F. ii. 1), which continued to exist throughout the imperial period and was restored by Antoninus Pius (Vita 9, 2). It is, however, far more likely that it represents the reliefs and the rostra were removed to the Forum according to Caesar's design. 1 When the oblong platform was built (perhaps by Trajan) it was approached from the back by the hemicycle. The bronze rostra on the imperial structure were believed to be the original from Antium, moved from the old rostra (Florus, i. 11). On its marble platform stood many statues, 2 e.g. of Sulla, Pompey, two of Julius Caesar, and others (Dio Cass. xiii. 18 and xlv. 4); these are represented on a bas-relief from the arch of Constantine. It is further commonly believed that the marble pilasters which now stand in the centre of the Forum once decorated the rostra. Owing probably to the weight of the many statues proving too much for the travertine piers, which are not set on their natural beds but endways, and therefore are very weak, the structure seems to have given way at more than one time, and the floor has been supported by piers and arches of brick-faced concrete.

1 See Mau in Röm. Mitt. 1906, pp. 230 ff.
2 The original rostra had specially honorary statues to those Roman ambassadors who had been killed while on foreign service (Liv. iv. 17); these were probably removed during Cicero's lifetime (Cic. P. J. iv. 2, 4; see also Dio Cass. liv. 13, H.N. xvi. 23, 24). Ghastly ornaments fixed to these rostra in the year 43 B.C., shortly after they were built, were the head and hands of the murdered Cicero (Appian, Bell. Civ. iv. 20; Dio Cass. xii. 8; Juv. x. 120), as on the original rostra had been fixed many heads of the chief rostra of the proscriptions of Marius and Sulla (see Appian, Bell. Civ. i. 71, 94; Florus iii. 21). The denarius of the gens Lollia with the legend PALIKANVS represents the rostra of the late republican period.
inserted either in place of or at the sides of the shattered piers. These later additions, apparently of the 3rd and 4th centuries, are omitted in fig. 8 for the sake of clearness. In or about A.D. 470 the façade of the rostra was prolonged northwards by an addition in very poor brickwork. A small part of this wall has since been removed, and is not earlier than the 3rd or 4th century. 1 At this end of the Forum the arch of Tiberius was built beside the Sacra Via. It was erected in A.D. 17, to commemorate the recovery of the standards lost by Varus. 2

The Basilica Julia 3 occupies a great part of the south-west side of the Forum, along the line of the Sacra Via; its ends are bounded by the Vicus Jugarius and the Vicus Tuscus. It was begun by Julius Caesar, who dedicated it when still unfinished, on the 26th of September 46 B.C., completed by Augustus, and again rebuilt by him after a fire, as is recorded in Mon. Anc. 4. 13, in an important passage which gives its complete early history. It consisted of a central hall with aisles, galleries and clerestory, surrounded on three sides by colonnades in two stories, and was built at the foot of the Capitoline hill, the whole taken up the place of the colonnade. The central nave was paved with richly coloured oriental marbles, namely pavonazzetto, cipollino, giallo and acriano. The covered aisles are paved with large slabs of white marble. Many tabulae iuristic, or gambling boards, are scattered among the marble pilasters, and the porticoes are sheathed with moulded plinth, closed the otherwise open arches of the basilica; many fragments exist, and one piece of the subplanth is still in situ. This basilica held four law-courts, which in important cases passed judgment. It was held that the basilicaes were courts (Dio Cass. lxxviii. 10). An inscription found near it (C.I.L. vi. 1658) records its restoration by Septimius Severus in A.D. 199, after a fire; it was again burnt in 283 and restored by Diocletian in 295. In 602 the eastern arches of Augustus; and Diocletian rebuilt it mostly with brick or travertine piers, portions of which remain. 9 A final restoration is recorded in inscriptions discovered at various times from the 16th century onwards, as being carried out by Galbaus Vettius Furianus, prefect of the city in 371; one of these is a pediment which stands in the Vicus Jugarius. Suetoian (Cal. 37) mentions that it was one of Caligula’s amusements to throw money to the people below from the roof of this basilica, which formed a link in the bridge by which the Roman Forum - became continuous with the Capitoline hill.

The Vicus Tuscus passes from the Sacra Via beneath the Basilica Julia and the temple of Castor to the Velabrum and Circus Maximus; its basin paving has been exposed at many points along its whole line. A very early statue of Vortumnus was recorded in this street, a little to the south-west of the Basilica Julia, where part of its pedestal was found in 1549 inscribed VORTVMVM TNPORIUS IOCLBTIANI ET MAXIMIANI . (Cass. Dio 176). The Vicus Tuscus was also called Thurius, from shops of perfume-sellers (see Schol. ad Hor. Sat. ii. 3, 228, and Ep. i. 1, 265). It is the street along which processions passed, mentioned by Cicero (Vat. i. 42) as finishing a signa Vesta, and by Livy (49). The temple of Castor or Pollux stood in this street, a little to the south-west of the Basilica Julia, where part of its pedestal was found in 1549 inscribed VORTVMVM TNPORIUS IOCLBTIANI ET MAXIMIANI . (Cass. Dio 176).

The Basilica Julia 3 occupies a great part of the south-west side of the Forum, along the line of the Sacra Via; its ends are bounded by the Vicus Jugarius and the Vicus Tuscus. It was begun by Julius Caesar, who dedicated it when still unfinished, on the 26th of September 46 B.C., completed

1 Below the temple of Saturn the Clivus Capitolineus is on an unarched structure of somewhat irregular opus reticulatum. This has been described (but without much probability) as the rostra of Caesar.

2 A portion of these streets with part of the temple of Saturn and the Basilica Julia is shown on fragments of the marble plan (see Plate VIII).

3 One side of this wall was built against one of the marble piers of the Basilica Julia, a perfect print of which still exists in the connecting wall of the rostra, though the marble pier itself has disappeared. The other side of the rostra abutted against the marble-lined podium of the temple of Saturn.

5 See Tac. Ann. ii. 41, who says it was propser aedem Saturni.

6 See S. Aug. 29, Gotthard, Bas. Giulia, &c. (1823); and Visconti, Esposizione della Bas. Giulia (1852).
a few remains of the earliest temple, built of blocks of grey-green tufa. Two fragments of mosaic, with simple lozenge pattern in white marble and basalt, still exist in the cela of this temple. The level of the mosaic, which probably belongs to the rebuilding of Tiberius, is considerably below that of the lower floor, which seems to date from Hadrian’s reign. It has all the characteristics of early mosaic—very small tesserae fitted with great accuracy, like the early mosaic in the Regia. The temple of Castor was often used as a meeting-place for the senate, and its lofty podium formed a tribunal for orations. The Fons or Lucus Juturnae (see Ov. Fast. i. 705, and Dionys. v. 13), at which the Dioscuri were fabled to have watered their horses, was beside their temple; the precinct was 400 ft. square, and enclosed a basin 163 ft. in diameter, and 64 ft. deep, is immediately opposite the three standing columns of the temple; in the centre is a base of opus reticulatum, which supported statues of the Dioscuri; an altar with reliefs, together with this base, still remains, and has been left alone. A few yards off is a small chapel or aedicula, intended for a statue of Juturna, and in front of it a well-curtained (pudicium) of white marble, set up by the aedile M. Barbatus Pollio in the reign of Augustus.

On the other side of the Sacra Via stand the remains of the temple of Divus Julius, erected by Augustus. Though little beyond its circular form is left, its foundations, supported as it was built from the voids in the concrete, which show the position of the tufa foundations, as well as the walls and columns (as in the temple of Castor). The temple itself, a hexastyle prostyle building, was 120 ft. square on a lofty podium with a curved recess in the front between two flights of stairs (see Plate VIII.). The wall which now fills up the recess is a late addition. In 1898 the base of a large altar was discovered in the temple just behind the podium, and has been preserved in the Louvre. In 1908, when the excavations were completed, it was built again by Appian (Bell. Civ. ii. 138). The podium, which projects in front of the temple itself, was adorned with beaks from the ships taken at Actium (Dio Cass. ii. 19), and hence it was called the Rostra. Two fluted Corinthian columns, nearly 45 ft. high, were also found at the temple of Castor, and these were probably some of those which stood in front of the temple of Divus Julius. Other fragments and a large number of tufa have been discovered in this temple, and it was restored or enlarged several times—by the Flavian emperors, who added the colonnade; Hadrian, who built the tablinum and other rooms at the end; the Antonines, and Septimius Severus, who built the tablinum, as well as other buildings on the site. It consists of a large atrium or quadripartite with columns of cippolino. At one end is the tablinum, with three small rooms on each side of it—probably for the six vestals. A bathroom, back-house, servants’ quarters, and a number of other buildings were added to the south-west side. This extensive building was set against the side of the Palatine, which is cut away to admit the lower storey. Thus the level of the first upper floor is nearly the same as that of the Nova Via, on which it stands, about 23 ft. above the ground floor. The upper floor is in part well preserved; it contains a large suite of bath and other rooms, which were probably the sleeping apartments of the vestals. All the other rooms and the baths are lined with tufa, and the walls of the tablinum are covered with a partly mosaic of tessellated work. The paving of the tablinum was a beautiful specimen of inlay in porphyry and marble. In many places alterations and clumsy patchings of the 4th and 5th centuries A.D. are to be seen; the marble was incised with the name of Severus, of Maximianus, of Constantine, and of Licinius, in which the vestalis maxima, with inscribed pedestals, was found in the atrium, mostly of the 3rd century, though a few are earlier; these are of especial interest as illustrating the sacerdotal dress of the vestals.

Nothing but the Nova via separates the Atrium Vestae from the imperial palace (see Plin. Ep. vii. 19; Aul. Gell. i. 12), which extends over the site of the Lucus Vestae—qui aristocratica radice in Novam Viam deversus est (Cic. De Div. i. 45). A curious oval structure in the middle of the atrium looks very much like a border for flower-beds; and it is possible that this miniature garden was made by the vestals when the Lucus Vestae ceased to exist. By the main entrance from the Forum stood a small aedicula—a large pedestal, at the angles of which were columns supporting an entablature. It no doubt contained a statue of Vesta, being none within the temple. It is of the time of Hadrian. Grattan confiscated the house and endowments of the vestals in A.D. 382, and added the property of the vestals to the corn-distribution for the city by order of the emperor, and the headship of them by imperial or papal officials. In September 1884 a road was

The columns were crimson, the travertine rain-water gutter bright blue, and the inner walls had simple designs in panels of leaf ornament and wreaths.

1 See Delbrück, Das Capitolium von Sestia (1903), p. 22; Der Apollotempel auf dem Marsfeld (1903), p. 14; van Buren in Corpus Inscriptionum Latinarum.

2 The front of the podium was decorated with ships’ beaks. One of the mad acts of Caligula was to make the temple of Castor into the vestibule of his palace by breaking through the back of the temple.

3 Another legend attributes its founding to Romulus.

4 On the coins see Dressel, Zeitschr. für Numismatik (1899), 20 ff.

6 See Her. iii. 27, Rome, Carst. 1912, p. 307, fig. 108.

7 See Jordan, Vesta und die Laren (Berlin, 1865); and Auer in the Denkschriften der Wiener Akademie (1888), ii. 209 ff.

8 The excavations of December 1883 a pot was found in the north corner containing 330 silver pennies of English kings of the 12th and 13th centuries—Alfred the Great, Edward I., and others. A list of these is given by De Rossi in Lanciani’s work, L’Atrio di Vesta (Rome, 1884). None are later
discovered leading up past the tablinum end of the atrium from the Porticus Variae to the Forum. In about the 4th century this road had been blocked up at the Nova Via end by a building which adjoined the Atrium Vestae.

At the north-east corner of the Forum stood the arch of Q. Fabius Maximus, consul, who Allobroges from his victory over the Allobroges (Schoel. On Cis., In Verr., Act. i. 7). This arch were dug up and mostly destroyed in 1546, near the temple of Faustina; on one of the fragments then discovered was inscribed Q. FABIVS Q. F. MAXVMSVS, AED. CVR. REST. (Dias, Inscr. ii. 43). About twenty-five other fragments were found in 1852.

The temple of Faustina the elder stands at the east angle of the Forum, facing the later line of the Sacra Via. It is prostyle hexastyle, and has monolithic columns of cipollino and a rich cornice of Pentelic marble, with 7 in. entablature of travertine. The entablature is covered with griffins and candelabra on the frieze. The walls are of massive peperino, once lined with marble. On the front is inscribed DIVO. ANTONINO. ET. DIVAE. FVASTINAE. EX. S. C.

This temple, built by Antoninus Pius in memory of his wife, who died in 141, was after his death dedicated also to him, and the first line was then added (Vita Ant. Pii, 6). In the Middle Ages it was consecrated as the church of S. Lorenzo in Miranda, and a great part of its cella has been destroyed. The front is now excavated to the original level. The only remains of several coins of Antoninus Pius; some have the legend Dedicatio. Aedes.

The space between the north-west end of the Forum and the Tabularium is occupied by a range of important buildings (see Plate VIII.). The chief of these is the temple of Concord.

Cam. 42), (S. P. Q. R. AEDEM, CONCORDIAE, VETSTATE. CEI PLAPAM. IMPERATORIVM. SCR. CVST. TVL. SPLENIDIORE. RESTITVVERVT (C.I.L. vi. 89).

The temple of Vespasian stands to the right of that on the temple of Apollo at Miletus.

The size of the earlier and smaller temple is indicated by the rotunda or cella of the Tabularium, close against which the temple stands. When the Tabularium was built it was not thought wise to press down to a smooth face that part of its wall which was concealed by the then existing temple of Concord.

Little is known of this temple, which probably adjoins the earlier temple of Concord, and the existing building appears also to have occupied the site of the Scenacum (see Festus, ed. Muller, p. 347). For various interesting scenes which took place in the temple of Concord and on its steps, see Cic. Phil. vi. 71; C. I. L. 619. Another temple of Concord, built in 216 B.C., stood on the Capitoline Arx (Liv. xii. 33, xxi. 21); and a bronze sculpture of Concord in the Area Vulcani, which must have been close by the great temple. This was dedicated by Cn. Flavius, 305 B.C. (see Liv. ix. 46); according to Pliny (H. N. xiii. 19) it stood in 1882. 1882.
fig-tree and the statue of Marsyas are repeated. Other explanations of these reliefs have been given, but the above appears the most probable. Towards the other end of the Forum are remains of a large concrete pedestal. It may possibly have supported an equus, a statue of an equus seen in the Forum of Augustus in the 8th century. A smaller foundation, laid bare by Comm. Boni's excavations in 1905, is thought by him to have supported the equestrian statue of Q. Marcus Tremenius, the conqueror of the Hernici, set up before the temple of Castor in n.c. 305 (Liv. ix. 43). The base of this pedestal stood on a pavement of brick with marble, which line the Sacra Via are not earlier than the time of Diocletian. They are probably the pedestals of honorary columns such as those shown in the relief on Constantine's arch, mentioned in the first century. They were excavated in 1877, but Smaragdus in the eleventh year of his exarchate (608) is still standing. It is a fine marble Corinthian column, stolen from some earlier building; it stands on rude steps of marble and tufa. The name of Palatine Hill or Palatium is sometimes referred to as the meniotis, an honorific epithet that was used for a temple. It is clear that the two columns—one of pavonazzetto, the other of grey granite—were set up on two of the brick bases in 1899.

In 1902 a network of passages (cuniculi) was discovered about 3 ft. beneath the pavement of the Forum. These have tufa walls and marble floors and are cut into large square blocks that were among the intersections of the passages are square chambers, in the centre of which are travertine blocks with sockets for windlasses. The construction of the passages seems to date from the time of Julius Caesar and might have been used for scenic purposes when games were given in the Forum. In 1903 a large concrete foundation was found, partly blocking the E. end of one of the cuniculi. There can be no doubt that this once supported a large colossal equestrian statue of Domitian described by Statius (Silv. i. 1. 21 ff.) which was destroyed after his murder. Embedded in the concrete was a cast of massive travertine blocks which was found to contain five archaic vases similar to those from the earlier foundations above, as inl. One held a nugget of quartz containing pure gold. It is uncertain whether these were buried here for ritual purposes or were the contents of an early tomb found in digging the foundations. Near this monument there were found in 1904 remains of an eagle that perched on the top of the column of an ancient statue. This must have been the altar which in imperial times represented the Lacinus Curtius (Ov. Fast. vi. 403). Beside this were found some remains of a structure of imperial date which Comm. Boni identified with the Tribunum at which justice was administered by the emperors.

Palatine Hill or Palatium.

In addition to the early walls described above, only a few remains now exist earlier in date than the later years of the republic; these are mostly grouped near the Scala Caci (see fig. 10, in Plan), and consist of small cellae and other structures of unknown use. They are partly built of the soft tufa used in the "wall of Romulus," and partly of hard granulated tufa so called. Various names, such as the "hut of Faustulus" and the "Auguratorium," have been given to these very ancient remains, but with little reason. On thing is certain, that the buildings were respected and preserved even under the empire, and were probably regarded as sacred relics of the earliest times.

1 Authorities on the Forum: For the earlier literature of the subject it will suffice to refer to Jordan, Topographie der Stad Rom, i. 2, 195-429, and, in English, to Nichols, The Roman Forum (1877). By far the best account based on the recent discoveries of Comm. Boni, is his book known as the "Plan" (Karl der Erlaute Berlin, 1900), in which full references are given. The official reports of excavations by Comm. Boni appear in intervals in the Notizie degli Scavi, and are largely concerned with the ancient necropolis. Huelot publishes reports in the Romanische Mitteilungen which are of great value.

2 Our knowledge of these remains has been considerably increased by excavations in this region begun in 1907, which form the subject of a series of reports by Prof. W. Woringer. The official report is in the Atti della Societa di Invent. ed archiiletali Italiani for that year, cf. Ashby in Classical Quarterly (1908), p. 145 ff. It is almost too much to hope that the difficult problems raised by these discoveries will ever be solved; meanwhile it is clear that there is a passage of a primitive age (pottery, foundations of huts, &c.) can come to light near the W. angle of the hill; (ii) that walls of various epochs have been found which may have belonged to a system of fortification, though this cannot be demonstrated; (iii) that some of the rectangles found with regularly laid tufa blocks was found (in a now-ground containing pottery of the 4th century B.C.

Remains of more than one temple of the republican period exist near this west angle of the Palatine. The larger of these (see Plan) has been called conjecturally the temple of Jupiter Victor (Liv. x. 29; Ov. Fast. iv. 621). It stands on a levelled platform tufa deck, the lower part of which is excavated into quarry chambers, used in later times as water reservoirs. Two ancient well-shafts lined with tufa communicate with these subterranean holes. Extensive foundations of hard tufa exist in the valley afterwards covered by the Flavian palace (see above), and excavated by Comm. Boni. It was probably one of the parts of republican date, and was used to support the Flavian palace. Not far from the top of the Scala Caci are the massive remains of a large cella, nothing of which now exists except the broken columns, portions of which were re-erected in the time of Constantine and remains of a Flavian temple, probably the temple of Jupiter Victrix. It was probably once lined with marble. By a noble colossal seated figure of a goddess was found, in Greek marble, well modelled, a work of the 1st century A.D. The heads of the Doors and is missing, but the figure is probably rightly called a statue of Cybele; and inscriptions dedicated to Magna Mater have been found close to the temple. Augustus in the Monumentum An cavumyrum (4, 8) records AEDEM. The large Flavian temple perhaps is the temple of Jupiter Victor, and the probably belongs to the Domus Tiberiana mentioned by Suetonius (Tit. 5; Tac. Hist. i. 27, iii. 71); this palace covered a great part of the area. The Flavian palace and temple was the same date is a very interesting and well-preserved private house of the time of the emperor Tiberius, and was surrounded by a great number of very small rooms, mostly bedrooms. The house is built in a sort of hole against the side of an elevation, so that the upper floor is in level with an ancient paved road. The ramp was caused by this is counteracted and kept off the paintings by a lining of flange-tiles over the external walls, under the stucco, thus forming an air-cavity all over the surface. From the back of the house, at the upper level, a long subterranean passage leads towards the Flavian palace, and then, turning right angles and passing over the foundations of the so-called temple of Jupiter Victor, and the ancient tufa building described above. Another crypto-porticus starts near this house and communicates with the long subterranean passage by which the palaces of Caligula and Domitian are connected. It is probable that the house extended far northwards under the gardens and the lower terrace, once painted and gilt. Some hold that the house was that of Germanicus, in which the soldiers who killed Caligula in the long crypto-porticus escaped, as described by Josephus (Ant. Jud. x. 11), see Suet. Cal. 54.

From the Summa Sacra Via a road led to the Area Palatina in the centre of the hill. Here was the sanctuary called Romana quadra, containing the mundus, a pit in which the instruments of the ancients were kept (see the following page). In the following page, on the west of the Area Apollinis, the entrance on the road by which led to lovely grove into a very extensive peristylic porticus, with columns of Numidian gilt; the temple was of white Luna marble. In the centre of the peristylic stood a statue of Apollo Palatinus. The splendidion and the countless works of art in gold,

It has recently been argued by Pinza that this is the temple of Apollo built by Augustus. See the Researches in Pls. xxii., xxiii.; Mau, Geschichte der Wandmalerl. pl. ix.; Renier, Les Peintures du Palatin (Paris, 1870).
silver, ivory, bronze and marble, mostly the production of the best Greek artists, which adorned this magnificent group of buildings, must have made it the chief glory of this splendid city. This temple was begun by Augustus in 36 B.C., after his Sicilian victory over Actaeon. Pompey, and dedicated on the 9th of October 28 B.C. A glowing account of the splendour of these buildings is given by Propertius (ii. 2, iii. 31). Inside the cella were statues of Apollo between Latona and Diana by Scopas, Cephisodotus and Timotheus respectively (Plin. H.N. xxxvi. 24, 25, 32); beneath the base of the monument was the shrine of the sacred well. Within the cella, the first frieze was a relief depicting the apotheosis of Apollo by Bupalus and Archermus of Chios (Plin. H.N. xxxvii. 13), and on the apex was Apollo in a quadriga of gilt bronze. The double door was covered with ivory reliefs of the death of the Niobids and Diana and Actaeon. At the back of the altar stood the Ancestral Image, consisting of records that Augustus melted down eighty silver statues of himself and with the money "offered golden gifts" to Apollo, dedicating them both in his own name and in the names of the original donors. One of the most important of the statues was of Apollo under the shade of Apollo (Suet. Aug. 31); and within the cella were vases, tripods and statues of gold and silver, with a collection of engraved gems dedicated by Marcellus (see Plin. H.N. xxxvii. 11, 14), 14.

In the porticus was a large library, with separate rooms for Latin and Greek literature, and a large hall where the senate occasionally met (Tac. Ann. ii. 37). Round the porticus, between the Numidian marble columns, were statues of the fifty Danaids, and opposite them their fifty bridgegrooms on horseback (see Plin. H.N. xxxvi. 13). The colonnade was the central feature of the temple, stood an altar surrounded by four oxen, the work of Myron (Prop. iii. 31, 5). In the centre of the Palatine stood the palace of Augustus, built in the years following 36 B.C., and renewed in the fire of Nero. It contained, on the western part of the palace, the C.I.L. (p. 317), dedicated on the 28th of April 12 B.C., when Augustus was elected pontifex maximus. Augustus's building was completely transformed by later emperors, but the name remains (see Plin. H.N. xxxvii. 3, 24). Whose house was afterwards bought by Cicero. Many other wealthy Romans had houses on this part of the Palatine. The part now existing is little more than the gigantic substructure built to raise the principal rooms to the level of the gardens. The enormous space in front of the Nova Via, opposite the Atrium Vestae, and many storeys of small vaulted rooms built in mixed brick and opus reticulatum rise one above the other to the higher levels. The palace extends over the Clivus Victorinus, supported on lofty arches so as to leave the road un-blocked; many travertine or marble stairs lead to the upper rooms, some starting from the Nova Via, others from the Clivus Victorinus. A large proportion of these substructures consist of dark rooms, with little or no lighting, others with scanty borrowed light. Many vaulted rooms and staircases were once richly decorated with marble linings, columns and mosaics; but little of these now remains. The upper part of the building contains the temple, and was found to have been decorated with brickwork, no opus reticulatum being used as in the lower portions of the Nova Via. This marks a difference of date, and this is confirmed by the occurrence of brick stamps of the 2nd century A.D.

The next great addition to the buildings of the Palatine was the magnificent suite of state apartments built by Domitian, over a deep natural valley running across the hill (see Plan). The valley was filled up and the level of the new palace raised to a considerable height above the natural surface. Remains of a house, decorated with painting and rich marbles, exist under Domitian's peristyly, partly destroyed by the foundations of cast concrete which cut right through it. The floor of this house shows the original level, far below that of the Roman palace. This is the Congress-Hotel, now a branch of the Big Hotel (see Plan). A subterranean passage leading into the earlier crypto-porticus. It consists of a block of state-rooms, in the centre of which is a large peristyly, with columns of oriental marble, at one end of which there was an entrance from the peristyle, while in the farther part of the building, which contains the Sibylline Hall, a large peristyly is a large throne-room, the walls of which were adorned with rows of pavonazzetto and giallo columns and large marble niches, in which were colossal statues of Phrygus and putti; to one of this is the basilica, with central nave and apse and narrow aisles, over which were galleries. The apse, in which was the emperor's throne, is screened off by open marble cancelli, a part of which still exists. It is of great interest as showing the origin of the Christian basilica (see BASILICA). On the other side of the peristyly was the vestibule of the basilica, with a door next to this is the grand staircase, which led to the upper rooms, now destroyed. The whole building, both floor, walls, and roof, was covered with the richest oriental marbles. Outside were colonnades and peristyles, and on the third floor of the palace, on the other side of the basilica, were small rooms, most of which are still preserved. A door in the centre of this floor led to the top of the hill, from which the Pantheon, which was used as a stage for performances of the Circus Maximus, could be seen. The northern part of the hill is covered with the remains of the circus, which is now a large open space, with a fine view of the Via Appia and the Colosseum. The passage was covered with mosaic of mixed marble and glass, a few fragments of which still remain; its walls were lined with rich marbles; it was lighted by a series of windows in the springing of the vaults, and by large lamps on the centre of the roof. It has suffered more than once from fire, and in many places important restorations of the time of Severus, and some as late as the 4th century, are evident. In 1720-28 extensive excavations were made here for the Farnese duke of Parma, and an immense number of courtiers and soldiers were discovered, many of which are now at Naples and elsewhere. Among them were sixteen beautiful fluted columns of pavonazzetto and giallo, fragments of the basalt statues, and an immense door-sill (see Plut. Poplic. 15, and Mart. viii. 36). Doors were arranged in the throne-room and basilica so that the emperor could slip out unobserved and reach by a staircase (g on Plan) the crypto-porticus and the papal apartments (see Plan). This part of the palace was called the Farnese, and was much admired by the Romans, and remained in use as a residence until the 16th century, when it was rebuilt for Cardinal Farnese, and in 1866. The building was taken down in 1866.
again partly laid bare in 1869 and the following years. This has often, but wrongly, been called the palace of Augustus; we should rather see in it the dwelling-rooms of the Flavian palace. Adjoining it is the so-called stadium of the Palatine ("Hippodromus" on Plan), begun by Domitian, enlarged by Hadrian, and much altered or restored by Severus. The greater part of the outer walls and the large exedra or apse at the side, with upper floor for the emperor's seat, are of the time of Hadrian, as is shown by the brick stamps, and the character of the brick facing, which much resembles that of the Flavian time (bricks 1½ in. and joints ½ in. thick). The stadium is surrounded with a colonnade of engaged shafts, forming a sort of aisle with gallery over it. Except those at the curved end, which are of Hadrian's time, these piers are of the time of Severus, as are also all the flat piers along the outer wall—ace opposite each of those in the inner line. Severus restored the galleries after the great fire of A.D. 191. This building was the hippodromus Palatii; the word here means, not a racecourse, but a garden (Plin. Ep. 5, 6, 19).

In addition to the stadium, Hadrian built a number of very handsome rooms, forming a palace on the south-east side and at the south-west end of the stadium. These rooms were partly destroyed and partly hidden by the later palace of Severus, the foundations of which in many places cut through and render useless the highly decorated rooms of Hadrian. The finest of these which is now visible is a room with a large window opening into the stadium near the south angle; it has intersecting barrel vaults, with deep coffers, richly ornamented in stucco. The oval structure shown in the plan (fig. 10), with other still later additions, belongs to the 6th century; in its walls, of opus mixtum, are found brick stamps of the reign of Theodoric, c. 500.

The palace of Septimius Severus was very extensive and of enormous height; it extends not only all over the south angle of the Palatine but also a long way into the valley of the Circus Maximus and towards the Coelian. This part (like Caligula's palace) is carried on very lofty arched sub-structures, so as to form a level, uniform with the top of the hill, on which the grand apartments stood. The whole height from the base of the Palatine to several storeys above its summit must have been enormous. Little now remains of the highest storeys, except part of a grand staircase which led to them. Extensive baths, originally decorated with marble linings and mosaics in glass and
marble, cover a great part of the top of the hill. These and other parts of the Palatine were supplied with water by an aqueduct built by Nero in continuation of the Claudian aqueduct, some arches of which still exist on the slope of the Palatine ("Aqua Claudia" on Plat. circles). In this same period, part of the main roads up to the Palatine passes under the arches substructures of Severus, and near this, at the foot of the hill, at the south angle, Septimius Severus built an outlying part of his palace, a building of great solemnity, and it is near this arch that the Via Velabrum enters. Part of the Septizodium existed as late as the reign of Titus V. (185-90), which destroyed it in order to use its marble decorations and columns in the new basilica of St Peter; drawings of it are in Pliny, Nat. Hist. v. 25. 

Velleia and Germahus. Palatine and the Esquiline on which the temple of Venus and Rome, and Rome and the arch of Titus now stand bore the name Velleia. It is evident that this was once higher than it is now; a great part of the noble palace of this emperor's subjugation of the Jews, but not completed until after his death, stands at the point where the Via Velabrum crosses the Via Velia; it is possible that it once stood farther to the east and was removed when the Via Velabrum was built. The temple of Venus and Rome was formed. The foundations of part of Nero's palace along the road between this temple and the Esquiline are exposed for about 20 to 30 ft. in height, showing a corresponding lowering of the Via Velabrum and the Via Velia rock, cut to a flat surface, is visible on the site of Hadrian's great temple; that the Via Velia was once much loftier is also indicated by the story of the removal of Valerius Publicola's dwelling.

IMPERIAL FORA

ROME

It appears that the figures given by Dionysius (iv. 61) for the area are slightly too large. The true measurements were 188 X 204 Roman ft.1 The temple is represented on many coins, both republican and imperial; these show that the central cella was that of Jupiter, that of Minerva on his right and of Juno on his left. The door was covered with gold reliefs, which were stolen by Stilicho (c. 400; Zosim. v. 38), and the gilt bronze tiles (cf. Plin. xxxii. 57) on the roof were partly stripped off by Geiseric in 453 (Procop. Bell. Vandal. i. 3), and the rest by Pope Honorius I. in 630 (Marliani, Topogr. ii. 1).2 Till 1348, when the steps up to Arn Coeli were built, there was no access to the Capitol from the back; hence the three ascents to it mentioned by Livy (iii. 7, v. 26-28) and Tacitus (Hist. iii. 71-72) were all from the inside of the Servian circuit. Even on this inner side it was defended by a wall, the gates in which are called "Capitoli forenses" by Tacitus. Part of the outer wall at the top of the tufa rock, which is cut into a smooth cliff, is visible from the modern Vicolo della Rupe Tarpeia; this is traditionally called the Tarpeian rock, but that must have been on the other side towards the Forum, from whence it was visible, as is clearly stated by Dionysius (vii. 35, viii. 78).3 Another piece of the ancient wall has been exposed, about half-way up the slope from the Forum to the Arx. It is built of soft yellow tufa blocks, five courses of which still remain in the existing fragment. The large temple of Juno Moneta ("the Adviser") on the Arx, built by Camillus in 384 B.C., was used as the mint; hence moneta = "money" (Liv. vi. 20).

A large number of other temples and smaller shrines stood on the Capitoline hill, a word used broadly to include both the Capitolium and the Arx.4 Among these were the temple of Honos and Virtus, built by Marius, and the temple of Fides, founded by Numa, and recently restored by Augustus. The walls of the temple of Vesta were used to hold meetings of the senate. The temples of Mars Ultor (Mon. Anc. 4, 5) and Jupiter Tonans (Suet. Aug. 29; Mon. Anc. 4, 3) were built by Augustus. Other shrines existed to Venus Victrix Octavia (i.e. the wife of Augustus), and to Concordia (Suet. Anc. 22; Liv. xxiii. 39)—and many others, as well as a triumphal arch in honour of Nero, and a crowd of statues and other works of art (see Plin. H.N. xxxii. 9, xxxiv. 38, 39, 40, 45, 44, 79, xxxv. 60, 100, 108, 157), so that the whole hill must have been a mass of architectural and artistic magnificence.

The so-called Tabularium5 occupies the central part of the side towards the Forum; it is set on the tufa rock, which is cut away to receive it. It derives its name from an inscription which remained in situ until the 15th century (C.I.L. vi. 1314); whilst all public departments had their tabularia, this was a central Record Office, where copies of laws and decrees were kept. This Tabularium was begun by Augustus, who was also the distributor of the great temple of Jupiter (Tac. Hist. iii. 72; Dio Cass. xliii. 14), consul in 78 B.C. Its outer walls are of tufa, its inner ones of marble; the Doric arcade has capitals, intercolumnia and string-courses; the walls are faced with peperino, or agglomerate, faced with a Corinthian colonnade, of which a few architectural members have been found. The columns appear to belong to the 1st century A.D. A road paved with basalt passes through the building along this arcade, entering and leaving the Clivus Capitolinus, and at the other probably from the Gradus Monetae, a flight of steps leading from the temple of Concord and the Forum up to the temple of Juno Moneta on the Arx. The entrance from the Clivus Capitolinus is by a wide flat and of open steps, but its enclosed story. It has been recently proved to have decorated the Forum of Trajan (Wace in Papers of the B.S.R. iv. p. 240, pl. xx). The front of the temple is shown on one of the reliefs of Marcus Aurelius now in the Palazzo dei Conservatori (Papers of the B.S.R. iii. pl. xxiv. 3).

2 The pediment is shown on a relief now lost, but extant in the 16th century at the City Museum, and found in that same relief that has recently been proved to have decorated the Forum of Trajan (Wace in Papers of the B.S.R. iv. p. 240, pl. xx). The front of the temple is shown on one of the reliefs of Marcus Aurelius now in the Palazzo dei Conservatori (Papers of the B.S.R. iii. pl. xxiv. 3).

3 See Rodocanachi, The Roman Capitol, p. 50. A graceful account of the legend of Tarpeia is given by Propertius, Eleg. iv. 4.

4 A structure of great sanctity, dating from prehistoric Etruscan times, the Clivus Capitolinus, an elevated platform upon the Arx, from which the signs in the heavens were observed by the augurs (see Festus, ed. Muller, p. 18).

5 On the Tabularium see Delbrück, Hellenistische Bauten in Latium, i. (1907), pp. 23-46.

or depression between the two peaks. From this higher level a long steep staircase of sixty-seven steps descends towards the Forum; the doorway at the foot of these stairs has a flat arch, with a circular relieving arch over it; it was blocked up by the temple of Vespasian. Great damage was done to this building by the additions of Boniface VIII. and Nicholas V., as well as by its being used as a salt store, by which the walls were much corroded.6

The Imperial Fora.

The Forum Julia (see fig. 11, Plan), with its central temple of Venus Genetrix, was begun, about 54 B.C., by Julius (who dedicated it in unfinished state in 46 B.C.) and completed by Augustus and Tiberius being added. From the top of the low wall which surrounds the low town, the most prominent feature is the wide avenue of cypresses leading from the Arch of Janus to the Temple of Minerva Medica, and passing through the Arch of Titus on its way to the Arch of Constantine near the entrance into the Forum from the south. Other roads linked the Forum with the city, the main one going westwards along the Via Sacra. One road was raised and carried over the Clivus Capitolinus by an aqueduct, with a bridge of stone, which is still visible.

1 See Suet. August. 20; cf. Plin. H.N. xxxiv. 103. 2 See Dio Cass. xliii. 22; Appian, Bell. Civ. ii. 102; Vitruv. iii. 3; Plut. Caes. 60. 3 See by Graecian inscriptions—In PRIVATO.SOLI.EMPETO. MARTIUS.TURIS.TEMPLVM.FORVM.MOVE.AUGVSTVM.EX. MANI.BISIT.FECI. See Suet. Aug. 29, 56; Dio Cass. lvi. 27; Plin. H.N. xxxiv. 102, 104, xxxv. 44, 47, 185, where many fine Greek works of art are mentioned as being in the forum of Augustus. 4 Those of Roman leaders and generals, from Aeneas and Romulus to Augustus. See Borsari, Foro d'Augusto, &c. (1884). 5 An interesting description of this discovery is given by Vacca, writing in 1594 (see Schreiber in Berichte der säch. Gesellsch. der Wissenschaften, 1881). The scale is roughly 1 to 250.
The Columna Cochlia (so called from its spiral stairs) is, including capital and base, 97 ft. 9 in. high, 24.6 i.e. 100 Roman ft.; its pedestal has reliefs of trophies of Dacian arms and trophies. Its column is made of white marble from Pentelic jasper. A rich frieze of twenty-three tiers scenes of Trajan's victories, containing about 2500 figures.

Trajan's forum consisted in 75, one of the most magnificent in Rome, which contained a very large collection of works of art.

The whole site of the forum was surrounded by a peperino wall, not only lined with marble but also decorated with rows of Corinthian columns supporting a rich entablature with sculptured frieze. The forum is 113 to 117, at least in size, the most magnificent of all; it was in progress from 60 B.C. to 113 A.D.

The forum of Trajan with its adjacent buildings was the last and, at least in size, the most magnificent of all, it was in progress from 60 B.C. to 113 A.D.

preserved. It may date from the 2nd century B.C. The neighbouring Ionic temple, popularly called of Fortuna Virilis, is of special interest from its early date, probably the end of the 3rd century B.C. The complete absence of marble and the very sparing use of travertine, combined with the simple purity of its design, indicate an early date. It has a prostylo tetraestyle portico of travertine, and a short cella of tufa with engaged columns; the bases of these and of the angle columns are of travertine. The frieze has reliefs of ox skulls. The cella was originally painted so that the different stones used would not show. Fig. 12 gives the plan, showing the hard travertine used at the points of greatest pressure, while the main walls with the hall columns are of the weaker and softer stone. The dedication of this temple is doubtful; it is probably an image of Ceres, of a shrine of Minerva, of the temple of Mater Matuta, both of which were destroyed in 183 B.C. and restored in the following year. The Porticus Octaviae in Cosmedin contains some remains of a temple (Plan, No. 4) which has been identified with that of Hercules built by Pompey ad Circum Maximum (Vitr. iii. 2, 5; Plin. H.N. xxxiv. 57). The Porticus Octaviae was destroyed by the destruction of the Capitol in the war with Sertorius, in the Forum Boarium. The columns built up in the church did not, however, belong to a temple, but to a porticus. Within the walls of S. Niccolò in Carcere in the Forum Holitorium (Plin. H.N. xxxiv. 57), three small hexastyle peripteral temples, two tufa and one Travertine, side by side. A fragment of the marble plan includes part of this group. The Tuscan temple is built of travertine, the others of tufa and porphyry, both travertine at the points of greatest pressure. They are probably those of the Temple of the Dioscuri dedicated by C. Duilius in the First Punic War (Tac. ann. ii. 49). Of Spes, built by A. Attilius Calatinus, of about the same date (Tac. Ann. ii. 49), and of Juno Sospita, dedicated by C. Cornelius Cethegus (Livy xiv. 53). The Porticus Octaviae are extensive remains of the large group of buildings included in the Porticus Octaviae (Plan, No. 16), two of which, dedicated to Juno Regina and Jupiter Stator, with part of the enclosing porticus and the adjoining temple of Jupiter in Tusculum, are shown on a fragment of the marble plan. The Porticus Octaviae, a large rectangular space enclosed by a double line of columns, was built in honour of Octavia by her brother Augustus. The temple of Venus in the space is shown on a fragment of the marble plan, and it was not confused with the neighbouring Porticus Octavia referred to by Cn. Octavius, the conqueror of Perseus (Livy xlv. 6, 42), in 168 B.C., and rebuilt under the same name by Augustus, as is recorded in the inscription on the altar of Augustus, the most magnificent in Rome, and contained a large number of works of art by Phidias and other Greek sculptors. The existing portico, which was the main entrance into the porticus, is a restoration of the 2nd century A.D. The church of S. Angelo in Pescheria and the houses behind it conceal extensive remains of the porticus and its temples (see Ann. Inst., 1861, p. 241, 1868, p. 108; and Conéjocht, I, Portici di Ostia, 1861).1

Recent excavations in the later peripteral Corinthian temple are built into the side of the Borsa (former of the Customs House). Eleven marble columns and their rich entablature are still in situ, with the corresponding part of the cella wall of peperino; in 1878 a piece of the end wall of the cella, which formed the part of the temple known as the peribolus wall, also of peperino, forming an enclosure with columns all round the temple nearly 330 ft. square (see Bull. Comm. Arch. Rom. vi. pl. iv., 1878). This temple has commonly been identified with the Temple of Fortuna Virilis (see Tac. Ann. ii. 49). It is surrounded by the Porticus Argonautarum (Dio Cass. iii. 27; Mart. iii. 20, 11); but it clearly dates, as at least in its present form, from the 2nd century A.D., and is not improbably the temple of Hadrian, 117-138 A.D., which was reconstructed in the time of Constantine. The temple of Venus and Rome on the Velia (see fig. 8) was the largest in Rome; it was pseudo-dipteral, with ten Corinthian columns of Greek marble at the ends, and probably twenty at the sides; it had an outer colonnade round the peribolus of about 180 columns of granite. Of these only a few fragments now exist; for several centuries the whole area of this building was used as a quarry, while the residue of the marble was burnt into lime on the spot in kilns built of broken fragments of the porphyry columns. A considerable part of the two cellae with their apses, set back to back, still exists; in this apse was a colossal seated figure of the deity, and along the side walls of the cellae were rows of very columnes and statues in niches. The vault is deeply coffered with stucco enrichments once painted and gilt. The roof was covered with tiles of gilt bronze, which were taken by Pope Honorius I. (625-38) to cover the basilica of St Peter. Temple stones from their sack of the Leonine city in 846. The emperor Hadrian himself designed this magnificent temple, which was partially completed in 135; the design was criticized severely by the architect Apollodorus of Damascus. The temple was probably finished by Antoninus Pius; it was partly burned in the reign of Maxentius, who began its restoration, which was carried on by Constantine. The existing remains of the two cellae with their apses, of Hadrian’s temple are not to be restored. Between the south angle of this temple and the arch of Constantine stand the remains of a fountain, usually known as the Meta Sudans. This was a tall conical structure in a large circular basin. From its brick facing it appears to be a work of the Flavian period.

That part of the Caelian hill which is near the Colosseum is covered with very extensive remains—a great perilous of brick-faced concrete, apparently of Flavian date, and part of a temple of the Augustan period. The temple of the Sun, of the Colosseum; most of the latter has been removed for the sake of the stone, but a portion still exists under the monastery and campanile of SS. Giovanni e Paolo. The houses could not be restored double the Palatine tombs. The temples of the Temple of Apollo Sosianus, dedicated to the very extensive thermes of Constantine, part of the site of which is now occupied by the Quirinal palace and neighbouring buildings.4

The excavations of recent years have brought to light, and in many cases destroyed, a large number of domestic buildings, these discoveries are recorded in the Notitiae Scavi and the Bull. Comm. Arch. Rom. The extensive cutting away of the Tiber bank for the new embankment exposed some very ornate houses near the Villa Farnesina, richly decorated in marble, which was carried away and set in the garden at any works of the kind that have ever been found. These are now exhibited in the Museo delle Terme, but the houses themselves have been destroyed. The laying out of the new Quirinal and Esquiline streets has also exposed remains of the quarter of the Esquiline have been supposed (without much probability) to belong to the villa of Maecenas. A very remarkable vaulted room, decorated with paintings of plants and landscapes, has been shown to be a greenhouse; at one end is an apse with a series of steps, stages for flowers. This one room has been preserved, the rest of the villa has been destroyed; it is on the road leading from S. Maria Maggiore to the Lateran. The walls are a very fine specimen of tufa opus reticulatum, un mixed with brick, evidently of the early imperial period. Among the numerous buildings discovered in the Horti Sallustiani near the Quirinal was a very fine house of the 2nd century A.D., in concrete faced with brick and opus reticulatum. It had a central circular domed hall, with many rooms and a number of archways. The street walls were set in the valley against a cliff of the Quirinal, so that the third floor is level with the upper part of the hill. It is nearly on the line of the Servian wall, which stood here at a higher level on the edge of the hill. This wall was the work of Servius Tullius, who was the son of his family until the reign of Tiberius, when he became imperial property; it was used as a residence by Nero (Tac. Ann. xiii. 47) and other emperors till the 4th century. It was the house of Varus, the first emperor of the Lateran, which was restored during the making of a new road. Some of these were of opus reticulatum of the 1st century B.C.; others had the finest kind of travertine temple and buildings, the others had the finest kind of travertine temple and buildings.5

1 Fichter (Rom. Mith., 1906, pp. 220 ff.) has endeavoured to show that the temple in its present form dates from the 1st century B.C.

2 For drawings of them, see the list given by Huelsen in Jordan, Topographie, ii. 3, 51, note 1.

3 The remains of the Porticus Octaviae have been more completely exposed by the demolition of the Ghetto.
brick-facing, probably of the time of Nero; all had been richly decorated with marble linings and mosaics. The line of the street was parallel to that of the later Aurelian wall, which at this point was built against the back of this row of houses. At the left of the breach was the Portico of Tiberinus, with peperino and tufo piers of the aqueduct rebuilt by Augustus, one arch of which forms the Porta S. Lorenzo. These interesting remains have all been completely destroyed. A fine house of the end of the 1st century A.D., with richly decorated walls, was excavated in the Via Flaminia in front of the Quirinal Palace Colonna; it was immediately destroyed to make room for new buildings.

The praetorium camp was first made permanent and surrounded with a wall by Augustus (Suet. Tib. 37). One part of the camp being included in the line of the Aurelian wall, a great part of it still exists: it is a very interesting specimen of early imperial brick-facing. The wall is only about 12 to 14 ft. high, but the fragments seen reach a height of 20 ft. The north-east gate (Porta Principalis Dextra) is well preserved; it had a tower on each side, now greatly reduced in height, in which are small windows with arched heads moulded in one piece. The lower part of the bricks are regular, but the ones above 13 in. thick, with 14-in. joints. On the inside of the wall are rows of small rooms for the guards. Part of the Porta Praetoria also remains. The camp was dismantled by Constantine, who removed its inner walls; the earth was used as a batter for the subsequent building of the Aurelian wall. The present wall is nearly three times the height of the original camp wall. The upper part was added when Aurelian included it in his general circuit wall round Rome. The outer surface of the wall was then thrown back, and it is easy to distinguish where his work ends and that of the later emperors begins. Owning to the addition of the later wall it requires some care to trace the rows of battlements which belong to Constantine.

The Pantheon is the most perfect among existing classical buildings in Rome. The inscription on the frieze of the portico (M. Agrippa. L. F. CONS. TERTIUM. FICT. RECTOR) refers to a building begun by Agrippa, completed by Augustus, and dedicated to the divinities of the Julian house (Mars, Venus, etc.) under the name Pantheon ("all-holy"); cf. Dio Cass. liv. 27; Plin. H. N. xxxvi. 43. It was sometimes used as the meeting-place of the Frates Arvalis before they began to meet in the temple of Concord (C.I.L. v. 2041). Flain mentions the sculpture by the Athenian Eignes which adorned it, and its capitals and dome covering of Syracusan bronze (xxiv. 7). It was long supposed that the present rotunda was the Pantheon of Agrippa; but this was destroyed in the great fire of A.D. 182. The dome was covered by the fire, and the foundations of the building were preserved beneath the flooring, and that Agrippa's Pantheon covered the present piazza and faced southward. The present portico has been reconstructed; it is probable that Agrippa's portico was part of the building the foundations of which was of bronze, supported by hollow bronze girders. The remains which stood long before by Constantine were the Porta S. Lorenzo; the bronze weighed 450,000 lb. The bronze tiles of the dome were given in 643, but on their way to Constantinople they were seized by the Saracens. The portico has eight columns on the front and three on the sides, all granite monoliths except the restored ones on the east side,-sixteen in all. The capitals are Corinthian, of white marble; the tympanum (apron) of porphyry, the plain entablature and frieze being of marble and the giant.
by Severus Alexander at the termination of his Alexandrine aqueduct, opened in 225 (see Hist. Aug. Sen. Alex. 25). But the marble trophies now set at the top of the Capitoline steps bear a quarry mark which shows them to be of the time of Domitian; it consists of the following inscription, now not visible, as it is cut on the under part—IMP. DOM. AVG. GERM. PER. CAESAR. LIB. 68. 

**Places of Amusement.**

The Circus Maximus (see Circus) occupied the Valls Murcia1 between the Palatine and the Aventine. Its first rows of seats, which were seven in number, and those of the three tiers of the Curia, were the search of Augustus (Plin. Hist. Nat. vii. 22). The new structure, which was dedicated to the upper being still of wood (Suet. Caes. 39); Dionysius (iii. 68) describes it as it was after this rebuilding. It was further ornamented with marble by Augustus, Claudius and other emperors. The whole structure was burnt in the great fire of Nero, and again under Domitian; it was considerably enlarged by Trajan, and lastly it was restored by Constantine. In its later state it had a marble façade with three external tiers of arches with engaged columns, and on top of these the marble seats, supported on column and raking vaults (Plin. Paneg. 51). A great part of these vaults existed in the 16th century, and is shown by Du Pérac. It is said by Pliny (H.N. xxxvi. 102)—if the text be not corrupt—to have held 250,000 spectators. According to Suetonius (Calig. 8) the Circus of Caligula had 250,000 seats as 458,000; but Huelsen has shown (Bull. Comm. Arch., 1894, 421 ff.) that the figures are much exaggerated and must, moreover, be interpreted, not of the number of spectators, but of the length of the tiers of arches, which was about 700 ft. long and 160 ft. wide. The Circus of Caracalla was near the church of S. Maria in Cosmedin.2 Some of its substructures, with remains of very early tufa structures on the Palatine side, still exist below the church of S. Anastasia (see Plan of Palatine). The obelisk now in the Piazza del Popolo was set on the spina of the Circus of Caracalla, which was built by Emperor Caracalla. The Circus Flaminius in the Campus Martius was built in 221 B.C. by the C. Flaminius Nepos who was killed at the Trasimene Lake in 217 B.C. remains of the structure existed until the 16th century, when it was partly demolished to be used for the building of the Zauro Maggiore. In the middle ages its long open space was used as a rope-way, hence the name of the church called S. Caterina dei Funari, which occupies part of its site.3 The circus of Caligula and Nero was at the foot of the Palatine, or the lower hill (Plin. Hist. Nat. xii. 18). The Circus of Maxentius, which is situated under most of the houses of the Piazza Navona (Agnonii), and especially below S. Agnese, is that built by Domitian and restored by Severus Alexander. That it was a stadium and not a circus is shown by the fact that its starting end is towards the Palatine Hill, whereas the central axis and middle course lies in the line of the spina.4 It was the case with the carceres of a circus; nor is there any trace of foundations of a spina. The best preserved circus is that built by Maxentius in honour of his deified son Romulus, by the Via Appia on the side of the walls of Rome. It was burned by Caracalla till 225, when an inscription recording its true dedication was found.5

The first permanent naumachia was that constructed by Augustus between the foot of the Janiculian hill and the Tiber. The naumachia of Domitian was placed on the marl, and the materials used to restore the Circus Maximus (Suet. Dom. 5); it was perhaps restored by Trajan, for the remains of a naumachia built of opus reticulatum5 mixed with brick have been discovered near the mausoleum of Hadrian. The first stone theatre in Rome was that built by Pompey in 55-52 B.C. (see Theatre: Roman); it contained a temple to Venus Victrix, and in front of it was a great porcicus, called the Naumachia from its hundred columns. This is shown on the marble plan. Considerable remains of the foundations exist between the Piazza dei Satiri, which occupies the site of the

---

1. See Bruza, in Ann. Inst. (1870), and Lenormant, Trophées de Mars (1842). This on an obelisk built, with the marble trophies in their place, is shown with much neatness on a bronze medallion of Severus Alexander (see Froehner, Médailons de l’empire, Paris, 1878, p. 169).
2. So called from a prehistoric altar to the Dea Musca (Varr. L. xiv. 171).
3. Of it is shown on a fragment of the marble plan (see Jordon, F.U.R.); it is represented on a bronze medallion of Gordian III., with an obelisk on the spina and three metae at each end; in front and behind are rows of wrestlers and boxers (see Crouzet, Rom. Mus. pl. xii. London, 1784).
4. The remains extant in the 16th century were described by Ligorio, Libro delle Antichità (1553), p. 17.
5. A portion of it is thought the marble plan (see Jordon, F.U.R.); it is represented on a bronze medallion of Gordian III., with an obelisk on the spina and three metae at each end; in front and behind are rows of wrestlers and boxers (see Crouzet, Rom. Mus. pl. xii. London, 1784).
6. The remains extant in the 16th century were described by Ligorio, Libro delle Antichità (1553), p. 17.
7. Some is a fragment of the Roman Peleus and his son Achilles, and is very highly venerated in Rome; it was dedicated to the Delphic Apollo in 341 B.C. by Cr. Julius (Liv. iv. 25); meetings of the Senate were held in it; and it contained many fine works of art—an ancient cenotaph, which was said to be that of the statue of the gods, the trophies of the slaughter of the Niobids by Praxiteles or Scopas (Plin. H.N. xxxvi. 28), of which many ancient copies exist. 
8. See the earliest known example of the so-called Composite order, a modification of Corinthian in which the capitals combine Ionic volutes with Corinthian acanthus leaves; in other respects it follows the Corinthian order.
Romans an arch of Janus Quadrifrons. Though partly built of earlier fragments, it is late in taste, and may be the Arcus Constantini mentioned in the Xth century. The finest existing arch is that by the Colosseum erected by Constantine. It owes, however, little of its beauty to that artificially degraded period. Nearly most of the whole design and many of its architectural features were stolen from an earlier arch erected by Trajan as an entrance to his forum (see above). The arch of Claudius, built in 43 to commemorate his supposed victories in Britain, stood across the north end of the Esquilina. The central position is shown in Bull. Comm. Arch. Rom., 1878, pl. iv. Its remains were removed in the middle of the 16th century, 1 and nothing now is left but half its inscription, preserved in the garden of the Barberini palaces. The arch of Antoninus, with an attic inscribed DE BRITANNIS, and surmounted by a quadriga and trophies. A little to the N. of the Piazza Colonna was an arch popularly called the Arco di Portogallo, destroyed in 1669, whose reliefs on the upper part and the base of the tufa wall are said to date from the reign of Hadrian, but may have been added at a later time to decorate this arch. An arch also stood opposite S. Maria in Via Lata until 1498, which was probably erected by Diocletian in A.D. 303. The central part of the once triple arch of Gallienus still exists on the Esquiline; it took the place of the ancient Porta Esquilina of the Servian wall. It is built of travertine, is in simple design, with coarse details, and has an inscription on its attic. The two side arches and pediments over the centre existed in the Mantuan oil-painting of Rome, 2 and in several antiquarian works of the 16th century. The inscription (C.I.L. vi. 1106) records that it was erected in honour of Gallienus and his wife Salonina by Aurelius Victor. The arch of Maxentius was still built of granite, erected after his death by his adopted sons M. Aurelius and L. Verus. fragmentation of the inscription in the Vatican with an interesting quarry inscription, recording that the work was cut in the presence of the emperor, the arches were erected by Antinous and of Dioscurus and the architect Aristides. The rest of its fragments were used by Pius VI. to repair the obelisk of Monte Citorio, set up by Augustus in the Campus Martius as the gnomon of a sundial (Paul. Vat. iii. 265). The inscription is engraved in the column is now in the Vatican; it has reliefs representing the apotheosis of Faustina and Antoninus Pius, and the decurio equitum which formed part of the funeral ceremony. This and the column of M. Aurelius was set in a surmounted column of red granite, set in a pedestal. The pedestal was originally much higher than at present, but is now partly buried; it is shown by Camucci, Du Férac and other 16th-century writers. This column stood in front of a temple to M. Aurelius, and within a great peribolus, forming a forum similar to that of Trajan, though much smaller; 3 remains of this temple, amongst other buildings, probably form the elevation now called Monte Citorio. 4

For the catacombs, see Catacombs; for obelisks, see Obelisk and Stelae.

The prehistoric cemeteries of Rome are described above (Prehistoric Rome). Few tombs exist of the Roman period earlier than the 1st century B.C.—probably owing to the great extension of the Servian wall, beyond the Servian limits, which thus obliterated the earlier burial-places. The tombs of the Cornelli Scipiones is the most important of early date which still exists. It is excavated in the tufa rock at the side of the Via Appia, outside the Porta Capena. Interventions of the Scipio family went here for about 400 years, additional chambers and passages being excavated from time to time. The peperino sarcophagi of Lucius Cornelius Scipio Barbatus (Liv. x. 12, 13), consular in 295 B.C., is now in the Vatican; its inscription is one of the earliest periods of the Latin alphabet. The sarcophagi are of specimens of early Latin epigraphy. Many other inscribed slabs were found in the 17th century, covering the loci in which the bodies of later members of the family. Those now existing in the public collections were copied by C. C. Corning. These burial-places of the Scipios is the Unlike those of other families owing to the custom of Corning, early in the Roman cycle of interment without burning; thus stone sarcophagi or loculi (rock-cut recesses) were required instead of mere pigeon-holes to hold the cinerary urns. The tomb of M. Bibulus, a few yards outside the Porta Fontinaria, and remains of two recently discovered under the destruction of the Aurelian towers at the Porta Salara, date from about the middle of the 1st century B.C., as also does the curious tomb of the baker Euryseus outside the Porta Maggiore. In 1863 an interesting tomb of the Sempronias genii 5 was discovered in the Quirinal, below the left of the Temple of the Porta Salutaria. It is of travertine, with a rich entablature and frieze sculptured with the Greek honeysuckle ornament (see Bull. Comm. Arch., 1876, 5, pl. xii.). This also is of the last years of the Republic.

The mausoleum of Augustus, built 28 B.C., stood in the north of the Campus Martius, between the Tibra and the Via Flaminia. It is a massive cylindrical structure of concrete, faced with opus reticulatum; according to Strabo, this was faced with marble. The building stood on a raised area of radiating chambers, in plan like a wheel. On the top was a great mound of earth, planted with trees and flowers (Tact. Ann. iii. 9). In the middle ages it was converted into a fortress by the Colonna, which was begun in 1567 and was completed under the next century. It was then occupied by a garden. 6 Only the bare core exists now, with its fine opus reticulatum, best seen in the court of the Palazzo Valdabruni. The inside is concealed by modern seats, being now used as a concert-hall (Antteatro Chorea). The sepulchral inscription in honour of Augustus, engraved on two bronze columns at the entrance, is preserved to us by its copy at Ancyra (g.v.). It records an almost incredible amount of building; in addition to the long list of buildings mentioned in the inscription, there is the recording of the stadium of Augustus, on the Esquiline. There is an inscription of the temple of Anchises under Domitian, and one of a temple of the Founders of Rome.

The mausoleum of Hadrian, built by that emperor as a substitute for that by Augustus, and dedicated in A.D. 138 by his successor, was a large circular building on a square podium, its walls, of enormous height, being of tufa faced with Parian marble and surrounded by a colonnade with rows of statutes,—a work of the greatest magnificence. The splendour of the whole is described by Procopius (Beli. Goth. i. 22), who mentions its siege by the Goths, Pius VII., and the present. In the 16th century it was occupied by a convent of nuns. In the 16th century the church of S. Angeli under Nubes was built on its summit, and all through the middle ages it served as a papal fortress. The interior chambers are still well preserved, but its enormous size, now that it has been wrecked and refaced that little of the original masonry is visible. 4 Several of the grander sepulchral monuments of Rome were built in the form of pyramids. One of these still exists, included in the Augustal mound, in the town of Rome, near the Esculapius, concrete, 118 feet high, faced with blocks of white marble, and contains a small chamber decorated with painted stucco. An inscription in large letters on the marble face mentions that it was begun as a tomb of D. V. C. OCTAV. PRAT. Tribune, of the people, and sepulchre of the epulones (officials who supervised banquets in honour of the gods). It was erected, according to Cestius’s will, by his executors, in the space of 330 days. Its plan and date from the time of Augustus (see Barberini, in Nardini, Roma Antica, iv. 1, ed. 1818—20). Another edifice of this pyramid variety is popularly known as the tomb of Romulus, stood between the mausoleum of Hadrian and the basilica of St. Peter. It was destroyed at the close of the 15th century, during the rebuilding of the old bridge which connects the former building with the Vatican.

The earliest bridge was a wooden drawbridge called the Pons Sublucius from the piles (subluciae) on which it was built. The river being an important part of the defences of Rome from the passage to the Porta Flumentana (map, fig. 8), no permanent bridges were made till the Romans were strong enough not to fear attacks from without. The Pons Sublucius had a sacred character, and was always restored in wood, even in the imperial period. It was replaced by a stone bridge, placed some distance below the Ponte Rotto. The first stone bridge was begun in 179 B.C. and completed in 142 B.C., when the conquest of Etruria and the defeat of Hannibal had put an end to fears of invasion, owing to which the Pons Aemilius, after the pontes maximi 6 of M. Aemilius Lepidus, its founder. It was also called Pons

5 The inscriptions are given in C.I.L. i. 29—39—vi. 188—94. On the earlier ones see Wolf, Münchener Sitzungsberichte (1892), 1886 ff.
Lapidus, to distinguish it from the wooden Sublician bridge. The modern Ponte Rotto represents this bridge; but the existing arches are mainly Roman. An ancient basalt-paved road still exists, leading from the Forum Boarium. The Pons Fabricius united the island (insula Tiberina) with the mainland. The bridge derived its name from L. Fabricius, a curator viarum in 62 BC; its inscription, a quindecimscripta, is in the Acta Fabrici, C. F. C. V. VIAR. VI. AVG. This like the other existing bridges, is built of travertine, and tufa, with a massive facing of Travertine on both sides. Corbels to support centering were built in near the springing of the arches, so that they could be repaired or even rebuilt without a scaffolding erected in the river. The bridge, therefore, was later than the Fabricius, i.e. after L. Cæcilius, praefectus urbis in 46 BC. uniting the islands and the Janiculum side; on the marble parapet is a long inscription recording its restoration in 370 by Gratian, Valentinian, and Valens. The next bridge, Ponte Sisto, is probably on the site of an ancient bridge called in the Notitia Pons Aurelius. Mariano gives it an inscription (now lost) which recorded its restoration in the time of Hadrian. About 100 yards above this bridge have been found the remains of a stone piers, which are proved by an inscription (C.I.L. iii. 31543) to have belonged to the Pons Cestius, not otherwise known. The Pons Aelius was built in 134 by Hadrian, to connect his mausoleum with the Campus Martius; it is still well preserved, and is now called the Ponte S. Angelo (see Dante, Inferno, xvii. 29s). There are two parallel bridges, of which the three in the centre were higher than the rest, so that the road sloped on both sides. The material is peperino, with travertine facings. Its inscription, now lost, is given in the Einsiedeln MS.; IMP. CAES. DIVI . TRAJANI . PONT. MAXIMI IMP. AVG. PONT. MAXIM. . ANVS. AVG. PONT. MAX. TRIB. POT. XVIII. COS. III. P. P. FECIT. The Pons Aelius is shown on coins of Hadrian. A little below it are the foundations of another bridge, probably the Pons Neronianus of the Milvæa, called also Pedum Aurelian, built probably by Nero as a way to his Vatican circus and the Horti Agrippinae. At the foot of the Aventine, near the Marmora, are the remains of a bridge, which seem to have belonged to the Pons Probi, mentioned in the Notitia (see p. 139). It is uncertain whether this bridge is to be identified with the Pons Theodori, which was built in A.D. 381-387 (Symm. Ep. 4. 70. 2; 5. 76. 3.), and is mentioned in the Milva. 

Regions of Augustus.

In spite of the extensive growth of the city under the republic no addition was made to the four regions of Servius till the reign of Augustus, who divided the city and its suburbs into fourteen regions. The lîsis in the Notitia and Curiosum are the chief aids in determining the limits of each, which in many cases cannot be done with any exactness (see Preller, Die Regionen der Stadt Rom (1849) and Urich's Codex Topographicus (Würzburg, 1871)). Each region was divided into vicini or parishes, each of which formed a religious body, with its ecclesiæ lauræ, and had magistri victorius.

The smallest regio (No. II.) contained seven vicini, the largest (No. XIV.) seventy-eight.

The list is as follows:—

I. Porta Capena, a narrow strip traversed by the Appian Way; it extended beyond the walls of Aurelian to the brook Almo.

II. Castelmonium, the Caelian Hill.

III. Ixius, the region of the valley of the Colosseum and the adjoining part of the Esquiline.

IV. Tempulai Pata, the valley of the Cispius, most of the Subura, the fora of Nerva and Vestianus, the Stabian, the Via and also buildings along the north-east side of the Forum Magnum.

V. Esquilina, north part of the Esquiline and the Viminal.

VI. Alba Semita, the Quirinal as far as the prætorian camp.

VII. Lata, the site on which later lay the Via Lata and by the neighbouring hills on the east.

VIII. Forum Romanum, also included the imperial fora and the Capitoline hill.

IX. Circus Flaminus, between the Tiber, the Capitol, and the Via Flaminia.

X. Palatium, the Palatine hill.

XI. Circus Maximus, the valley between the Palatine and the Tibre, the Velabrum, and the ruins of the Circus Flaminus.

XII. Piscinæ Publicoe, the eastern part of the Aventine, and the districts south of and beyond the Via Appia, including the site of Caracallæ's thermae.

1 Livy (ii. 5) gives the fable of the formation of this island from the Tarquins' corm, cut from the Cæmus Martius and thrown into the river.

2 The two stone bridges connecting the island with the right and left banks took the place of earlier wooden structures.

3 See Meyerhöfer, Die Brücken im alten Rom, 1883.

XIII. Aventine, the hill, and the bank of the Tiber below it.

XIV. Trans Tiberim, the whole district across the river and the Tiber Island.

The walls of Aurelian (see fig. 7), more than 12 m. in circuit, enclosed almost the entire site of the city of Augustus, the greater part of which were then thinly inhabited. This enormous wall was begun in 271, to defend Rome against sudden attacks of the Germans and other northern races when the great armies of Rome were absent in distant countries. After the death of Aurelian the walls were completed by Probus in 280, and about a century later they were restored and strengthened by the addition of gate-towers under Arcadius and Honorius (A.D. 403). I place the earlier gateways of Aurelian; this is recorded by existing inscriptions on the three of the gates. At many periods these walls suffered much more from the attacks of the Goths (Procop. Bell. Goth. iii. 22. 24), and were restored successively by Theodoric (about 500), by Belisarius (about 500), and by various popes during the 8th-11th centuries, and in fact all through the middle ages. A great part of the Aurelian wall still exists in a more or less perfect state; but it has wholly vanished where it skirted the river, and a great part of its trans-Tiberine course is gone. The best-preserved pieces are between Porta Pia and Porta Salaria, in which breaches have lately been made for streets, and between the Lateran and the Amphitheatrum Castrense. The wall, of concrete, has the usual brick-facade and is about 12 ft. thick, with a guard's passage formed in its thickness. Fig. 13 shows its plan: on the inside the

---

The text of the Regionary Catalogues is printed by Richter, Topographie der Stadt Rom (1872). The inscriptions run thus: S. P. Q. R. IMP. CAES. D. D. INVICTISSIMIS PRINCIPIBVS ARCADIO. ET. HONORIO. VICTORIO. A. A., TRIB. HONOR., TRIB. HONOR. PRINCIPI. VESTRIS. AETERNAE. MVROS. PORTAS. AC. TVRES. AEDES. IMMEMS. RYBRIBVS.—The rest refers to honorary statues erected to commemorate this work.
the Domus Lateranoruni, a house of the 3rd century which gave its name to the Lateran basilica, and a little farther on, by S. Croce in Gerusalemme, the Amphitheatrum Castrense; the latter, of about the end of the 1st century A.D., has two tiers of arches and engaged columns of moulded brick on the outside. Between the P. Praenestinorum and the P. Tiburtinorum comes a large castellum of the Aqua Tepula. The Praetorian Camp forms a great projection near the P. Nomentanorum. Lastly, the angle near the Porta Flaminia, at the foot of the Capitoline Hill, a very large aqueduct running from the Aqua Marcia, Tepula, and Julia crossed the Via Tiburtina. The inner gateway, built of massive travertine blocks by Honorius, was pulled down by Plutarch, in 1686.

Bibliography of Ancient Roman Topography. Amongst ancient writers special mention is due to Varro (De Lingua Latina), Dionysius of Halicarnassus (Antiquitates Romanae, Ovid (Fasti), Vitruvius (De Architectura), Pliny the Elder (Naturalis Historia), Frontinus (De Aquaeductu Urbis Romae) and Augustus (Res gestae divi Augusti). The most recent book of ancient topography is the Monumenta Ancieta (1899–1906), by A. Coner, in the Socio Museum by Dr. Ashby, in Papers of the British School at Rome, vol. ii. Amongst the printed works of the early Italian architects may be named Palladio, Architettura (Venice, 1542), and Terme dei Romani (London, 1736). But the most important of the earlier collections are the Speculum Romanae Magnificentiae of the 17th century, published by P. Giocondo, and Du Pérac's Vestigii di Roma (1576). To the 18th century belong the itinera of Piranesi, published in several volumes, and still reproduced from the copper-plates by the Calcografia.

In the reign of Constantine the Great there was compiled a catalogue of the principal buildings of Rome, arranged according to the fourteen regions of Augustus. This has been preserved in two recensions, the one of ancient concerning the original, the other in or about A.D. 357, and known as the Curvus urbis Romae. These are called the Regionary Catalogues, and contain, besides lists of buildings, statistics as to the numbers of vici, domus, insulae, &c., and the number of families of each region. There are of great value. (See Freiler, Regionen der Stadt Rom, Jena, 1846.)

In the middle ages, guide-books were written for the use of pilgrims visiting Rome. Besides giving the routes for the principal churches, they gave much information on the ancient monuments, and often of the ancient legends regarding them. The earliest is the Itinerarium de Einsiedeln, a MS., of the 8th century preserved in the monastery of Einsiedeln in Switzerland (see C. Huelen, L'itinerario di Einsiedeln, 1808). In the 12th century was compiled the Mirabilia Urbis Romae, which became the foundation of later guide-books. The last recension is contained in a MS. of the early 15th century. These and other medieval documents are printed in Uffici's Codex Topographicus urbis Romae (1871). The Ordo Benedicti Canonicorum (see Freiler, loc. cit., p. 640) and the Liber Pontificiorum, vol. iii. (1873), give the dates of the popes of their time. The latter, however, gives the biographies of the early popes and was continued throughout the middle ages, is of value as illustrating the transition from pagan to Christian Rome.

The earliest written plans of Rome exist, beginning with the painting by Cimabue in the upper church of SS. Francesco at Assisi (1275). A collection of these was published by De Rossi, Planeta iconografiche e prospettiche di Roma antemi di secolo XVI, 1875. Maps of the later ages come to light. (See Huelen in Bull. Comm. Arch., 1802, p. 38.)

In Italian and other libraries are preserved large numbers of

1 Cf. Procop. Bell. Goth. i. 23.
2 On the walls of Aurelian, see (in addition to the general works mentioned in the bibliography) Nibby and Gell, Le Mura di Roma (1820); Quarenhghi, Le Mura di Roma (1880); and especially Homo, Essai sur le règne de l'empereur Aurélien (Paris, 1894). IV. 5 partie, ch. ii., L'Enteinte de Rome.
CHRISTIAN ROME

(from 1886); Papers of the British School at Rome (from 1903). Brief reports of discoveries are published by Dr T. Ashby in the Classical Review.

All previous archaeological maps of Rome have been superseded by L. D'Ancona, Formae urbis Romae antiquae, sheets 21 and 22. Kiepert and Huelsen's Formae urbis Romae antiquae date from 1896; they are accompanied by a Nomenclature topographica. Homo, Lexicon de topographia romana, is also useful. (J. H. M.; H. S. J.)

ROME

From the 4th to the 12th Century

The era of church building in Rome may be said to begin with the reign of Constantine and the peace of the church. Before then Christian worship was conducted with various degrees of severity, both in private houses or in the catacombs (q.v.), consisting as the reigning emperor viewed the sect with tolerance or dislike. The type of church which in the beginning of the 4th century was adopted with certain modifications from the pagan basilica, though varying much in size, had little or no variety in its general form and arrangement. One fixed model was strictly adhered to for many centuries, and, in spite of numberless alterations and additions, can be traced in nearly all the ancient churches of Rome. It is fully described and illustrated in the article BASILICA.

The walls of these early churches were mostly build of concrete, faced with brick, left structurally quite plain, and decorated only with painted stucco or glass mosaics—respectively, either on the walls with slabs of translucent alabaster; the latter was the case at S. Lorenzo fuori le Mura, and examples of the former still exist in the very early church formed in the rooms of some thermae on the Esquiline (possibly those of Trajan), below the stables of the Emperor, or those of Constantine's Domitian. Almost the only bit of external architectural ornament was the cavo cornice, frequently (as at the last-named church) formed of marble cornices stolen from earlier classical buildings. In nearly all the nave columns, with their capitals and bases, were usually taken from some classical building, and some churches are perfect museums of fine sculptured caps and rich marble shafts of every material and design. At first the nave had no arches, the columns supporting a horizontal entablature, as in St Peter's, S. Clemente, and S. Maria Maggiore, but afterwards, in order to widen the intercolumniation, simple round arches of narrow span were introduced, thus requiring fewer columns.

The roof was at first the simple longitudinal form, later overridden by the gabled form, and at last the dome, decorated with painting or metal plates. The floor was paved either with coarse mosaic of large tesserae (as at S. Pudentiana) or with slabs of marble stripped from ancient buildings. A later development in this plan was added a new compartment on each side of each aisle, as in S. Maria in Cosmedin and S. Pietro in Vincoli.

The type of church above described was used as a model for far the majority of early churches not only in Rome, but also in England, France, Germany, and other Western countries.

Circular Church.

Another form was, however, occasionally used in Rome, which appears to have been derived from the round temple of pagan times. This is a circular building, usually donut-shaped with one or more rings of pilared aisles. To this class belong the combined church and mausoleum of Costanza (see fig. 14) and that of S. Marcellinus and Peter, both built by Constantine, the former to hold the tomb of his colleague, and the latter to that of his mother Helena. The latter is on the Via Labicana, about 2 m. outside the ancient wall; it is a circular domed building, now known as the Torre Pignattara, from the pigeon which has nested in the concrete dome to lighten it. The mausoleum of S. Costanza, close by S. Agnese fuori, is also domed, with circular aisle, or rather ambulatory, the vault of the latter decorated with mosaic of classical style (see MOSAIC, vol. xviii, p. 885). The church of S. Stefano Rotondo in the Vatican, also dome, with pilared aisles, from the same mausolea are now in the Vatican. On a much larger scale is the church of S. Stefano Rotondo on the Esquiline, built by Pope Simplicius (468-492), with a double ring of pillars in the north and a new entablature, the great dome was built by Nicholas V. Other round churches are S. Teodoro (by the Visco Tuscus), restored in the 8th century, and S. Bernardo, which is one of the domed halls of Diocletian's thermae, consecrated as a church in 1598.

Space will not allow the individual description of the very numerous and important churches in Rome which are built on the basilican plan. The principal examples are these—S. Pudentiana, traditionally said to have been in Rome, restored in 438; S. Clemente, restored under Siricius (384-399), now forming the crypt of an old church built in the 12th century; S. Sabina, 5th century; S. Vitale, 5th century, founded by Innocent I. (401-417); S. Maria Maggiore, 6th century; church of Ara Coeli, founded by Gregory the Great (590-604) as S. Maria in Capitolio; S. Giorgio in Velabro, rebuilt by Leo II. (682-683); S. Cesareo, 8th century; S. Maria in Via Lata, restored by Sergius I. (687-701); S. Crisogono, rebuilt in 731 by Gregory III.; S. Maria Maggiore in Cosmedin, built by S. Pietro in Vincoli, and S. Giovanni ad Portam Latinam, rebuilt c. 772 by Adrian I.; S. Maria Domoinca, rebuilt by Paschal I. (817-824), who also rebuilt S. Cecilia in Trastevere and F. S. Trinita dei Monti, by S. Sabina, rebuilt by Gregory IV. in 853; S. Maria Nuova, rebuilt by Nicholas I. (858-867), now called S. Francesca Romana; the church of the SS. Quattro Coronati, rebuilt by Paschal II. about 1113; and S. Maria in Trastevere, rebuilt by Innocent II. in 1130.

Though the apses and classical columns of the naves in these churches were built at the dates indicated, yet in many cases it is difficult to trace the development of the alterations and additions of many centuries have frequently almost wholly concealed the original structure. Except at S. Clemente, the early choir, placed as shown in fig. 26, has invariably been destroyed; the sides have been given through the addition of a number of chapels; and the whole church, both within and without, has been overlaid with the most incongruous architectural features in stucco or stone. The open roof is usually concealed either by a wooden ceiling or by a stucco vault. The throne and marble benches in the apse have usually given place to more modern wooden fittings, to suit the later position of the choir, which has always been transferred from the nave to the apse. In many cases the mosaics of the apse and the columns of the nave are the only visible remains of the once simple and stately original church.

From 1200 to 1450; and the Papal Palaces

The 13th and 14th centuries in Rome were extraordinarily barren in the production of all branches of the fine arts, even that of architecture; and it was not till the end of the 12th that any important revival began. The 13th century was, however, one of great artistic activity, when an immense number of beautiful works, especially in marble enriched with mosaic, were produced in Rome. This revival, though on different lines, was very similar to the rather later one, which took place at Pisa (see PISANO), and, like that, was in great part due to the great artistic talents of one family,—the Cosmati, which, for four or five generations, produced skilful architects, sculptors and mosaicists.

This list does not include the great basilicas of Rome, for which see BASILICA. On the contrary, the churches of Rome see ARMELLINI, Le chiese di Roma (2nd ed. 1891); Tucker and Malleson, Handbook to Christian and Ecclesiastical Rome (1900); Marucchi, Basiliche e Iesuiti di Roma (1902); Frothingham, Monuments of Christian Rome (1910). The interior of the Vatican has in recent years been restored according to primitive tradition.

On the Cosmati see Boito, Architetura del Medio Evo (Milan, 1886, pp. 117-182); Clause, Les Marbriers romains et le mobilier byzantin (Paris, 1892); Crowe and Cavalcaselle, History of Painting in Italy (ed. Douglas, 1903), ch. iii.
The first member of the family of whom we have knowledge was Lorenzo, who, with his son Jacopo, made the ambones of S. Maria in Ara Coeli and an altar-canyopy (ciborium) in SS. Apostoli. Jacopo decorated the door of S. Sabba in 1205 and, together with his son Cosma, decorated the door of S. Maria in Ariccia. The father and son worked together at Civita Castellana in 1210. Cosma made a ciborium for SS. Giovanni e Paolo in 1235, and worked with his sons Luca and Jacopo at Anagni and Subiaco during the first half of the 13th century. So far the art has enabled us to trace the relationships of the Cosmati with certainty; it is not clear whether the Cosma above mentioned is to be identified with the master who decorated the chapel of the Sacra Sindone at Monza in 1228, which was subsequently reconstructed by Nicholas III. (1277-1280). This Cosma was, however, almost certainly the father of Giovanni, the last of the family, who made the tombs of Cardinal Durand (died 1299) in S. Maria sopra Minerva, Cardinal Stefano Vescovi, and his brother Stefano (died 1301) in S. Balbina. Another artist who seems to have belonged to this family, Deodato, made the ciboria of S. Maria in Cosmedin and (probably) of S. John Lateran; he is probably identical with the Deodato filius Cosmati who, together with another Jacopo, executed a pavement at S. Jacobo a Monza. A great number of works of this school, but unrecorded, exist in Rome. These are mainly altars and baldacchini, choir-screens, canopied stalls, ambones, tombs, and the like, enriched with sculpture and glass mosaics. Many have been destroyed or removed.

Besides the more mechanical sort of work, such as mosaic patterns and architectural decoration, they also produced mosaics and sculpture of very high merit, especially the recumbent effigies, with its dramatic details, standing in the niches of the large altar of S. Maria in Ara Coeli, S. Maria Maggiore, and elsewhere. One of their finest works is in S. Cesareo; this is a marble altar richly decorated with mosaic in sculptured panels, and (below) two angels drawing back a curtain (a beautiful specimen of the Cosmati art). Another of these altars is in S. Maria in Olearia.

Besides the Cosmati, other artists, such as Paulus Romanus and his sons in the 12th century, and Petrus Vassalletus, in the 13th, contributed to the revival of art. The beautiful choisters of S. Giovanni in Chiavica, built by Giovanni and Petrus, and S. John Lateran, the work of Vassalletus, are the finest architectural works of this school. In the latter part of the 13th century we find the sculptor Arnolfo del Cambio at work in Rome. His altar-canyopy in S. Giovanni in Laterano has left us many observations to which the Cosmati in their latest works; his tomb of Cardinal de' Braye (d. 1282) at Orvieto also shows his intimate connexion with that school. Another artist of the same period, Petrus Oderius, worked in England; the shrine of the Confessor at Westminster (1269) was made by him.

The earlier works of the Cosmati are Romanesque in style, but in the 13th century Gothic elements were introduced, especially in the elaborate altar-canopies, with their geometrical tracery. In detail, however, they differ widely from the pure Gothic of northern countries. The richness of effect which the English or French architect obtained by elaborate and carefully worked mouldings was produced in Italy by the beauty of polished marbles and jewel-like mosaics—the details being mostly rather coarse and often carelessly executed.

Chiefly to the 13th century belong the large number of beautiful canopied altars, which are the most conspicuous relics of the medieval period in Rome. The finest of these are attached to the churches of S. Francesca Romana, S. Giovanni e Paolo, S. Maria Maggiore. Other belong to the basilicas of S. Lorenzo fuori le Mura and S. Croce in Gerusalemme, and to S. Giorgio in Velabro, S. Maria in Cosmedin, S. Alessio, S. Giovanni ad Portam Latinam, S. Cecilia, S. Crisogono, and S. Pudentiana. They occupy various positions with regard to the church, being all later additions; that of S. Giovanni e Paolo stands at some distance from it. In design they are very similar, consisting of many stages, divided by brick and marble cornices; in the upper storeys are from two to four windows on each side, with round arches supported on slender marble columns. They are decorated with brilliantly coloured ciotole or disks of earthenware, enamelled and painted in green or turquoise blue, among the earliest existing specimens of the so-called majolica (see Ceramics). Sometimes disks or crosses made of red or green porphyry are inlaid in the walls. In most cases on one face of the top storey is a projecting canopied niche, which once contained the statue of the Virgin or Madonna. The walls are meant to form the next brickwork. The largest and once the handsomest of all, that of S. Maria Maggiore, has string-courses of enamelled and coloured terra-cotta. The slender columns of the windows have often proved insufficient to support the weight, and so many of the arches are built up.²

Though but little used for churches, the Gothic style, in its modified Italian form, was almost universally employed for domestic architecture in Rome during the 13th and 14th centuries. Tufa or brick was used for the walls of the main walls, the lowest storey being often supported on an arcade of pointed arches and marble columns. The windows were usually formed of large marble slabs with trefoil-shaped heads or cusped arches. As a rule the upper storeys projected slightly over the lower wall, and were supported on small ornamental machicolations. The top storey frequently had an open loggia, with rows of pointed arches. When vaulting was used it also was of the pointed form, usually in simple quadripartite bays, with slightly moulded groin-ribs. The finest existing specimen of this style is the palace built about 1300 by Boniface VIII. (Benedetto Gaetani), enclosing the tomb of Cecilia Metella on the Via Appia, with a graceful little chapel within the precincts of the castle. This building is most worthy of study; the remaining part is well preserved.

Many houses of this period, though generally much injured by alterations, still exist in Rome. They are mostly in out-of-the-way alleys, and, not being mentioned in any books, are seldom examined. The Ghetto (now destroyed) and the quarter near the Ponte Rotto contained many of these interesting buildings, as well as some of the most crowded parts of the Trastevere district, but most have disappeared owing to the wholesale destruction of old streets. Among those which may possibly escape for a while is the 13th century house where Giulio Romano lived, near the Palazzo di Venezia, and the Albergo del Orso, at the end of the Via di Tordinona, of the same period, which was an inn in the 16th century and is now; this has remains of a fine upper loggia, with rich cornices in moulded terra-cotta; the lowest storey has pointed vaulting resting on many pillars. Another graceful but less stately house exists, though sadly mutilated, with pointed or moulded ribs; it is in the Trastevere.² Few now remain of the once numerous lofty towers built by the turbulent Roman barons for purposes of defence. The finest, the Torre delle Milizie on the Viminal, was built in the 13th century by the sons of Petrus Alexius; of about the same date is the Torre dei Conti, near the forum of Augustus, built by Marchione of Arezzo; both these were once much higher than they are now; they are very simple and noble in design, with massive walls faced with neat brickwork.

Till the 14th century the Lateran was the usual residence of the pope; this was once a very extensive building, covering four times its present area. The original house is said to have belonged to the senator Plautius Lateranus in the reign of Nero; but the existing part on the line of the Aurelian wall is of the 3rd century. This house, which had become the property of the emperors, was given by Constantine as a residence for S. Sylvester. It was much enlarged by Benedict X during the next ten centuries; in 1308 a great part was burnt, and in 1356 the ancient palace was completely destroyed by Sixtus V., and the present palace built by Domenico Fontana. The Cappella Sanza Sanctorum (see list of Cosmati works) is the only relic of the older palace.³

¹ See De Montaual, Les Clilles de Rome (Arnav, 1874).
² For many centuries wall-facing of small tufa stones was used, e.g. in the medieval part of the Capitoll; this was called "opera saracinesca" from its supposed adoption from the Saracens; it is largely employed in the walls and towers of the Leonine city, still preserved, near the V. Laterano.
³ The house of Crescentius, popularly called the "house of Rienzi," near the Ponte Rotto, is perhaps the sole relic of the domestic architecture of an earlier period—the 12th century. Its architectural decorations are an extraordinary mixture of marble and stucco of the most miscellaneous sort, all taken from classical buildings; it has an inscription over the doorway, from which we learn that it was the property of "Crescentius, son of Niccolao."
⁴ See Rohault de Fleury, Le Lainron au moyen age (Paris, 1877).
The present palace has never been used as a papal residence; in the 18th century it was an orphan asylum, and is now a museum of classical sculpture and early Christian remains.

The Vatican palace originated in a residence built by Symmachus (408–514) adjoining the basilica of S. Peter. This was rebuilt by Innocent III. (c. 1200) and enlarged by Nicholas III. (1277–80). It did not, however, become the fixed residence of the popes till after the return from Avignon in 1377. In 1415 John XXIII. connected the Vatican and the castle of S. Angelo by a covered passage carried on arches. But little of the existing palace is older than the 15th century; Nicholas V. in 1447 began its reconstruction on a magnificent scale, and this was carried on by Sixtus IV. (Sistine chapel), Alexander VI. (Torre Borgia), Julius II. and Leo X. (Bramante’s cortile and Raphael’s Loggia and Stanze), and Paul III. (Sala Regia and Cappella Paolina by Antonio da Sangallo the Younger). The buildings, and his successors built the lofty part of the palace on the east of Bramante’s cortile. The Sala Regia was built by Bernini for Urban VIII. and Alexander VII., the Museo Pio-Clementino under Clement XIV. and Pius VI., the Braccio Nuovo under Pius VII., and lastly the grand stairs up to the cortile were added by Pius IX.

The Quirinal palace, now occupied by the king of Italy, is devoid of architectural merit. It stands on the highest part of the hill, near the site of the baths of Constantine.

The only important church in Rome which is wholly Gothic in style is S. Maria sopra Minerva, the chief church of the Dominican order. This was not the work of a Roman architect, but was designed by two Dominican friars from Florence—Fra Ristori and Fra Sisto—about 1289, who were also the architects of their own church of S. Maria Novella. It resembles the composite churches of the same order in Florence, having wide-spanned pointed arches on clustered piers and simple quadripartite vaulting. Its details resemble the early French in character. It contains a large number of fine tombs; among them that of Durandus, bishop of Mende (the author of the celebrated Rationale divinorum officiorum), by Giovanni Cosma, c. 1300, and the tomb of Fra Angelico, the great Dominican painter, who died in Rome, 1455. The most elaborate specimen of ecclesiastical Gothic in Rome is that part of S. Maria in Ara Coeli which was rebuilt about 1300, probably by one of the Cosmati, namely, the south aisle and transept. During the 14th century (chiefly owing to the absence of the popes at Avignon) the arts were neglected at Rome, and a period of decadence set in. The sculptured effigy and reredos of Cardinal Ruffo, c. 1380 (d. 1403) in the church of S. Maria in Trastevere, is a fair example of the works produced during this period; the effigy is a very clumsy and feeble copy of the fine recumbent figures of the Cosmati.

Florentine Period, c. 1450–1550.

The long period of almost complete artistic inactivity in Rome was broken in the 15th century by the introduction of a number of foreign artists, chiefly Florentines, who during this and the succeeding period produced an immense number of magnificent works of art. The dawn of this brilliant epoch may be said to have begun with the arrival of Fra Angelico (see FIESOLE) in 1447, invited by Nicholas V. to paint the walls of his small private chapel in the Vatican dedicated to S. Lorenzo.

In the latter half of the 15th century a large number of sculptured tombs (as well as tabernacles, altar frontal, reredoses, and the like) were made for Roman churches by sculptors from Tuscany and northern Italy. The earliest of these tombs is that of Eugenius IV. (d. 1447) in S. Salvatore in Lauro, by Isaia da Pisa. It presents the typical form of a life-sized recumbent effigy resting on a richly ornamented sarcophagus over which is a canopy decorated with reliefs and statuettes. The type was brought to perfection by the Florentine Mino da Fiesole (see MINO DI GIOVANNI), who worked in Rome under Pius II. and succeeding popes, being assisted in some cases by another artist of almost equal skill, Giovanni Dalmata. A Lombard sculptor, Andrea Bregno, came to Rome under Paul II. and worked there until the closing years of the century; his tomb is in S. Maria Sopra Minerva. The works of these artists and their followers are to be found in a great number of churches, notably S. Maria del Popolo.

The architecture no less than the sculpture of the latter part of the 15th century was mainly the work of Florentines, especially of Baccio Pontelli, who is said by Vasari to have built S. Maria del Popolo, S. Agostino, and S. Cosimato in Trastevere. He also was the architect of S. Pietro in Montorio, erected in 1500 for Ferdinand and Isabella of Spain. The building of this and other churches was carried out by another Florentine, Giuliano da Sangallo. The Palazzo di Venezia, begun for Cardinal Barbo, afterwards Paul II., about 1455, a very massive and stately building, was begun by Giuliano da Sangallo and Francesco di Borgo San Sepolcro.

During the latter part of the 15th and the first few years of the succeeding century Rome was enriched with a number of buildings by Bramante (q.v.), one of the greatest architects the world has ever seen. He combined the delicacy of detail and the graceful lightness of the Gothic with the monumental mass and stateliness of early Renaissance classic architecture. Though he invariably used the round arch and took his mouldings from antique sources, his beautiful cloisters and loggie are Gothic in their general conception. Moreover, he never undertook the building of the prevalent type of the time, a fruitless attempt to obtain magnificence by mere size in a building, without multiplying its parts. His principal works in Rome are the Palazzo della Cancelleria, built for Cardinal Raimo (1495–1503), with the famous building of the Church of S. Maria di Loreto; the Palazzo di Bramante in the Vecchio, built in 1506; and the Palazzo Giraud, near St Peter’s, once the residence of Cardinal Wolsey, built in 1507. He also built the cortile of S. Damaso in the Vatican, the so-called Tempietto, and the chapels of S. Maria degli Scalzi in Trastevere. In 1503 Bramante was appointed architect to St Peter’s, and made complete designs for it, with a plan in the form of a Greek cross. The piers and arches of this church are still part of the remains of the church of his death in 1514, and subsequent architects did not carry out his design.

Balassare Peruzzi (q.v.) of Siena was one of the most talented architects of the first part of the 16th century; the Villa Farnesina and the Palazzo Massimi alle Colonne are from his designs. His later works bear traces of that decadence in taste which so soon began, owing mainly to the rapidly growing love for the dull magnificence of the pseudo-classic style. This falling off in taste, which was not confined to Rome, was due to any other one man. His cortile of the Farnese palace, though a work of much stately beauty, was one of the first stages towards lifeless scholasticism and blind following of antique forms which were the death of the architecture of the succeeding century; the 16th century produced so much that is almost brutal in its coarseness and neglect of all true canons of proportion and scale. During the earlier stage, however, of this decadence, and throughout the 15th century, a large number of fine palaces and churches were built in and near Rome by various able artists, such as the Villa Madama by Raphael, part of the Palazzo Farnese by Antonio da Sangallo the younger, Giovanni de’ Fiorentini by J. Sansovino, and many others.

(J. H. M.; H. S. J.)

Later Development

The transformation of Roman architecture after the 16th century was marked by the abandonment of classical models. The works of Michelangelo were too grand to be accused of exceeding the extreme limits of good taste, but his scholars and imitators exaggerated his manner, and the barocco style, which was born in Rome, under the successive popes of the 17th century, spread over Italy and as far as the home of the Renaissance, Flanders and Spain. The building of the Lateran, under Sixtus V. (1585–90), was in this style, while that of St Peter’s, the work of the Popes, Paul III. and Clement VII., was in the same period. The same may be said of the work of the Popes, Paul III. and Clement VII., was in the same period. The same may be said of the works of the Popes, Paul III. and Clement VII., was in the same period. The same may be said of the works of the Popes, Paul III. and Clement VII., was in the same period.

The upper storey of the latter is varied by having horizontal lines instead of arched windows.

See Geymüller, Projekts primitifs für das basilique de St Pierre à Rome (Paris, 1875–85).

A valuable account of Raphael’s architectural works is given by Raffaello come Architetto (Milan, 1882). Drawings of many of the finest palaces of Rome are given in the fine work by Letarouilly, Edifices de Rome moderne (Brussels, 1856–66).

1 See Letarouilly, Le Vatican et le basilique de St Pierre à Rome (Paris, 1882).

2 The presence of a triforium is one of the chief reasons why the large Gothic churches of Italy are so inferior in effect to the cathedrals of France and England.
which had its cradle in Rome, was soon adopted throughout Italy. Vignola, (1507-1573) had done his best to bind the
patterns of building to the strictly classic rules, but in spite
of his efforts the degeneration made progress during
his own lifetime and under Cardinal Maderna (1555-1635),
and proceeded still more rapidly under Bernini (1598-1680).
The characteristics of the barocco are the reckless abuse of
curves and extravagantly broken lines, of contorted columns,
twisted tympanums and highly exaggerated ornaments; yet
we must confess that many monuments of this period of art
exhibit such exuberant life, such contrasts of relief and shadow,
and such a wonderful combination of variety and solidity as
cannot fail to please the many, even now, by the magnificence
of their general effect. In Rome, the numerous works of
Bernini, Borromini, Maderna, Rainaldi, Salvi, Fuga, Longhi
and others bear witness to the gifted activity of Italian
architects during that period, if genius necessarily creates,
those men showed more of it than their predecessors who
adhered to the classic and revered the teachings of Vitruvius.
Degeneration is tolerated and sometimes even praises, under
the name of transformation, but there is nothing to be said
for the real decay which marks the 18th century. It was not
universal at first, for it is by nature a slow process; such men
as A. Galli, Specchi, Paparelli, Marchioni, Morelli, Camporese
and Piranesi left works not altogether without value; but
the outrageous abuse of ornament increased with every year,
and was made more and more evident by the clumsy heaviness
of the pillars and pilasters that supported the whole.
The refined purity of the Renaissance disappeared as completely
as the delicate grace and exquisite ornamentation of the
Cosmatesque period. Many works of the greatest beauty were
destroyed outright, and many more were disfigured and often
wholly hidden by horrible stucco constructions and decorations;
or, on a larger scale, by the application of hideous stone
façades to churches of which the simple good taste had delighted
generations of mankind. The decoration of the noble old
Lateran basilica is a conspicuous instance of such deeds; another
is Santa Maria Maggiore, and the false fronts plastered upon
San Marcello and Santa Maria in Via Lata, both in the Corso,
give a very clear idea of what was generally done. The interiors
of old churches suffered quite as much, and even the frescoes
of early masters were not spared; those by Pinturicchio
in the third chapel (south) of S. Maria del Popolo were covered
with wretched stucco ornaments, only removed in 1850, and
numberless works of art by Giotto and other early painters
were wilfully destroyed.

The decline of architecture continued in the 19th century,
notwithstanding the laudable efforts of Frascati, and a few
of the lingering imitators, who produced the so-called
"academic neo-classic" reaction; among them may be noted
the names of Canina, Poletti, Sarti and Azzurri. The futility
of their works invited the feeble eclecticism which soon after
wards became so general that the architecture of the period
is wholly without individuality, good or bad. The chief
architectural work of the 19th century was the rebuilding of
the great basilica of S. Paolo fuori le Mura, burnt in 1823, in
a style of cold splendour which is anything but devotional in
its general effect. The pillars are huge monoliths of grey
granite from the Alps; the confessio and transcepts are lined
withrosso and verde antico from quarries then recently re-
discovered in Greece, and with Egyptian alabaster and lapis
lazuli and malachite adorn the bases of the columns round
the high altar in lavish profusion. Thirty years were required
for the construction of the magnificent office, which
was re consecrated in 1854. The east façade displays a quantity
of gaudy mosaics, and the projected quadrangular is wanting.
The belfry is nothing but a steeple, and has an unfortunate
resemblance to a lighthouse. In extenuation of the result it
must be admitted that the original building had been totally
destroyed by fire, but no such excuse can be found for the
barbarous assault on Christian art which was perpetrated by
Francesco Vespignani in the extension of the Lateran basilica.

This work was begun under Pius IX. and finished under
Leo XIII.; it involved the destruction of the ancient tribunal
and its ambulatory, the only parts of the church which had
so far escaped complete demolition, and the priceless
mosaics (1290), among the most beautiful in Rome, were taken
down and replaced in the new apse in a sadly mutilated and
restored form. (For the interesting discoveries made in
cavorting for the new foundations, see Ann. Ist. 1877, p. 332.)
The Vatican contains the largest collection in the world of
Greco-Roman and Roman sculpture, with a few specimens of true Hellenic
art. It is also very rich in Greek vases and in objects from
Etruscan tombs; this latter class is also well represented in
the Museo Gregoriano. There is also an Egyptian museum
which contains a few important curiosities. In the great
library are preserved a number of early glass chalices and other
rare objects from the catacombs, as well as many master-
pieces of later Christian art—church plate and jewels. The picture
gallery, though not as large as some of the private collections in
Rome, contains few inferior pictures. The Lateran palace, still,
like the Vatican, is not possessed of a collection and contains
a fine collection of classical sculpture, but is most remarkable as a museum
of Christian antiquities. The two capitoline museums are very
rich in classical sculpture, bronzes, coins, pottery and the contents of
two tombs discovered in the Capitoline area. The Capitoline Museum,
and is filled with sculptures found in Rome since 1870, of which
the arrangement was completed on the occasion of King Edward VII.'s
visit. The picture gallery contains a few masterpieces and a large number
of inferior pictures. Very few works were ever formed in the great cloister of S. Maria degli Angeli, to hold
the numerous fine examples of classical painting and sculpture found
along the Tiber during the excavations for the new embankment,
and not having been placed in the church, it has thus escaped
collections of minerals, fossils and other geological specimens,
and examples of ancient marbles used in the buildings of Rome.
A Museo Artistico Industriale has been formed in a monastery in
the Latera quarter, and was, in fact, already in existence a year or two before
the matter of the few medieval works which Rome
possesses should be scattered in three small collections, namely,
the one last mentioned, the Capitol and the Castle of S. Angelo, where
the best specimens are preserved in a more or less perfect state,
many objects, too, are dispersed throughout the city, and will doubtless
be preserved unless they are better protected. The Museo Kirchherrino
contains an unrivalled collection of prehistoric objects of stone,
bronze, iron and pottery, found in Italy and the Italian islands,
and many other small collections of minerals, fossils and other objects
of various kinds. Another branch is the Ethnological Museum, in which
the foremost objects are arranged for purposes of study, being neither well arranged nor well catalogued.
The Museo Baracco, presented to the city in 1905 by the senator
of that name, contains some ancient sculptures of great value. The Museo
d'Arte Antiqua is the most important of the museums on the
museo: it is a museum of fine art, paintings, and engravings. There are a few fine paintings in the Barberini palace,
but the Sciarra gallery no longer exists. There are some good
pictures by Raphael and Guido Reni in the Academy of St Luke;
also in that quarter, the Institute of Hellenic Art is a collection of modern paintings
acquired by the government.

The largest private collection of sculpture is that of the Villa
Albani, which, among a large mass of inferior Roman sculpture,
contains a few gems of Greek art. The original Albani collection
was stolen and brought to Paris by Napoleon I., and was there
dispersed; one relief, the celebrated Antinous, is the only piece of
sculpture from the original collection which was sent back from
Paris. The present Albani collection is most interesting, and contains
several very fine works, but unfortunately the greater number are
much injured and falsified by restorations. The casino in
the Borghese gardens possesses a great quantity of sculpture, mostly
the works of Roman imitators, of inferior quality, which
are executed in precious marbles. The small collection which formerly
existed in the Villa Ludovici has been bought by
the government and removed to the Museo delle Terme; it contained
a few works of Greek sculpture of great merit. The

The
Giustiniani collection, which was considerable, is now dispersed, but many private residences, such as the Colonna palace, still contain collections of sculpture and painting of a secondary order.

The principal libraries in Rome are, for old and modern works, the Biblioteca Vittorio Emanuele and the library of the German Archaeological Institute; for manuscripts and early books, the Angelica, the Casanatense, the Alessandrina and the Chigi libraries; but none of them can be compared with that of the Vatican, which now contains also the former library of the Barberini. Mention must also be made of the Corsiniana, now belonging to the Accademia dei Lincei. The Biblioteca Sarti, beside the Academy of S. Luke, contains works on art.

THE MODERN CITY

Great changes in the municipal and social conditions of Rome followed the occupation of the city by the Italians (20th September 1870), and the rapid increase of population due to immigration from other parts of Italy. It is a mistake, however, to attribute all the works undertaken and executed since 1870 to the initiative of the new government. The first plan for modernizing and improving Rome was that of Pope Julius II., who aimed at the enlargement of the lower city on both sides of the Tiber. The modern Via Garibaldi now in part was meant to do. Following him, Sixtus V. did his best to develop the upper part of the city by laying out the Via Sistina, from the Trinità dei Monti to S. Maria Maggiore and Porta S. Giovanni. Almost in our own time a plan for the improvement of the city was made, under the direction of Mgr. de Merode, during the reign of Pius IX.; and although but a small portion of the projected changes were carried out under the pope, the general scheme was in most respects satisfactory, and proved a good foundation for further extensive developments. He was able to complete the construction of the beautiful ascent to S. Pietro in Montorio, as well as that which leads up to the Quirinal Palace; and the Via Nazionale, which was to have been called Via De Merode, was also begun. His plan did not include, however, the destruction of villas such as the Ludovisi, nor the wholesale removal of trees, which is so greatly to be deplored. These acts of barbarism were the consequences of the reckless speculations in land and buildings that accompanied and followed the active and excellent work done by the municipality, and might have been checked by vigorous and serious action. The other urgent matter was one of which the government of Pius IX. had been well aware, namely, the necessity for opening better thoroughfares between different parts of the city. In the middle ages the population of Rome had dwindled to twenty or thirty thousand inhabitants, who lived huddled together about the strongholds of the barons, and the modern city had slowly grown again upon the exiguous foundation of a medieval town. The need for changing this condition of things, which had been felt under Pius IX., became overwhelmingly apparent as the population rapidly increased. That which under a continuance of the old government might have been done by degrees during a long period, had to be accomplished in the shortest possible time, with means which, though considerable, were far from adequate, and in the face of opposition by many holders of real estate, the most important of whom were conservatively attached to the papal government, and resisted change for no other reason. In what was now done it is necessary to distinguish clearly between the work undertaken and carried out by the municipality, under considerable pressure of circumstances, and that which was done in the way of private speculation. The first was on the whole good, and has proved enduring; the second was in many cases bad, and resulted in great loss. As soon as the opening of such streets as the Via Nazionale and the Via Cavour, the widening and straightening of the Via dell' Angelo Custode, now the Via del Tritone Nuovo, and similar improvements, such as the construction of new bridges over the Tiber, had demonstrated that the value of property could be doubled and quadrupled in a short time, and as soon as the increase of population had caused a general rise in rents, owners of property awoke to the situation of affairs, and became as anxious as they had at first been disinclined to improve their estates by wholesale building.

The most important and expensive work executed by the government under the assistance of the municipality was the construction of the embankments along the Tiber. Though the greatest part of the grandiose plan of the late Roman solidary was on paper, the civil work, especially the embankment, largely done by the municipality, made the city of Rome a place of solid stability, which alone saved the city from the disastrous consequences of a wide inundation. It is impossible not to admire them, and not to feel respect for a people able to carry out such a plan in such a manner and in so short a time, in the face of such great difficulties. But so far as the life of the city was concerned, the cutting of new streets and the widening of old ones produced a more apparent immediate result. The opening of such a thoroughfare as the Via Nazionale could not but prove to be of the greatest value. It begins at the Piazza delle Terme, in which the principal railway station is situated, and connects the upper part of the city by a broad straight road, and then, by easy gradients, with the Forum of Trajan, the Piazza dei Santi Apostoli and the Piazza di Venezia, whence, as the Corso Vittorio Emanuele, it runs through the heart of the old city, being designed to reach St Peter's by a new bridge of the same name, near the bridge of S. Angelo. It is true that, in order to accomplish this, the Villa Aldobrandini had to be partially destroyed, but this is almost the only point which lovers of beauty can regret, and in compensation it opened to full view the front of the basilica of S. Andrea della Valle, and the noble pile of the Chigi palace, one of the best pieces of architecture in Rome. Another great artery is the Via Cavour, which was intended to connect the railway station with the south-western part of Rome, descending to the Forum, and thence turning northwards to reach the Piazza di Venezia on the east side of the monument to Victor Emmanuel II. These are only examples of what was done, for it would be impossible to give a just idea of the transformation of the city, Rome is now divided clearly into two parts, the old and the new, of which the old is incomparably the more artistic and the more beautiful, as it will always remain the more interesting. Among the works carried out by the government and the municipality the fine tunnel under the Quirinal Hill (completed in 1902) deserves mention; it forms a connecting channel for the traffic between the streets at the north end of the old city, the Corso, Babuino, &c., and the upper part of Rome, including the Via Nazionale and the Esquiline. Another difficult undertaking, successfully completed in April 1908, was the construction of the enormous canalway and bridge which now unite the Pincio with the Villa Borghese, or, as it is now called, the Villa Umberto Primo, to the immense advantage of the public. In the same time the building for the new law courts was finished; it stands near S. Angelo, and presents, on the whole, an imposing appearance, though overloaded with clumsy stone ornamentation.

It is unnecessary to mention a number of public buildings and government offices which have little architectural merit, but we cannot overlook such a magnificent group of buildings devoted to scientific purposes as the Policlínico, on the Macas, which is admittedly one of the finest hospitals in Europe, and the military
hospital on the Coelian. The rebuilding of the Palazzo del
Parlamento is only second to the enormous monument of Victor
Emanuel II. The majority of the buildings erected by individ-
uals and corporations since 1870 present no original or charac-
teristic features, and the best of them are copies or imitations
of well-known models. The Cassa del Risparmio, in the Corso,
reproduces a Florentine palace; the Palazzo Negroni, near the
Piazza Nicotia, is modelled on the Cancelleria and the Palazzo
Giraud; many of the large residences in the new quarters
beyond the Tiber are fairly good copies of palaces in the Floren-
tine style, though the magnificent carved stone of earlier
centuries is disadvantageously replaced by stucco, a material
which lasts tolerably well in the mild climate of Rome. Opposite
the beautiful and severe Palazzo di Venezia, what might have
been a faultless reproduction of it is marred by tasteless orna-
ment. Finally, so far as the construction of new streets is con-
cerned, which lovers of the picturesque so greatly deplore, it
must be admitted that they have been rendered accessibler
by the great increase of traffic and population, and it should be
remembered that after the 16th century the wisest of the popes
did their best to open up the city by widening and straightening
the thoroughfares.

Municipal Administration.—After the taking of Rome, those
persons who remained loyal to Pius IX. took no part whatever
in public affairs, and the municipal administration was entirely
in the hands of the monarchists. The expression "nè eletti
delettori," meaning that Catholics are to be neither voters
nor candidates, which came to be regarded as a sort of rule
of the party, was invented at that time by an epigrammatical
journalist, and it seems at first to have been applied also
to municipal matters, whereas it was later understood to refer
only to parliamentary elections. Leo XIII. encouraged the
formation of a Catholic party in the municipal administration,
and the communal government drifted largely into the hands of
Catholics. Under such circumstances it is necessary that the
Syndic (Mayor) should always be a royalist. Between
1870 and the end of the century the socialist party had no
great influence in Rome, which can never be a city of manu-
factoring interests. For purposes of municipal government
the division of the city into districts has been modified, but the
old division into fourteen rioni is adhered to in principle.
The new quarters of Castro Pretorio and the Esquiline having
been included in the first Rione, which still bears the name of
"Monti." The municipality consists of a mayor and eighty communal
councillors, of whom a large proportion are for many years mem-
ers of the aristocracy. Later, however, the three democratic
parties, known as the monarchists, socialists and republican,
united to form a popular coalition, and succeeded in completely
excluding the conservative, aristocratic and Catholic elements.

Population.—The population in 1870 was 226,622, as against
49,741 in 1861 (census population). It therefore more
than doubled in thirty years. The increase, however, did not
take place at a regular rate, owing to the changes in the rates
of immigration and emigration. The largest increase was in
1870, reaching 22,186; the next most important in 1884, 1885,
1886, 1887, in which years it constantly remained near 20,000.
The least increase in later years was 4,447 in 1891. The garrison
of Rome is about 10,000 men. Careful inquiry has placed it
beyond doubt that there are in Rome about the same number
of ecclesiastics of all orders, including about 1,500 students in
the theological seminaries. The average birth-rate is lower
in Rome than in the majority of great cities. The number of
births increased after 1870 very nearly in proportion with the
increase of population.

Climate and Hygiene.—The climate of Rome is mild and
sunny, but the variation in temperature between day and night
is the greatest. December and February appear to be the coldest
months; the thermometer then averaging 9°F., the greatest
heat, which averages 75°F., is felt in July and August. The sur-
rounding Campagna is still not all habitable during the summer,
though the dangerous malaria has been checked by the planting
of numerous eucalyptus trees. A remarkable instance of the
effect produced upon the marshy soil by these plantations
may be studied at the Trappist monastery of the Tre Fontane,
situated on the Via Ardeatina, about 4 m. from Rome. Whereas
in former times it was almost always fatal to spend the whole
summer there, the monks have so far dried the soil by means
of the eucalyptus that they reside in the monastery throughout
the year. The municipality has everywhere made strenuous
efforts to reduce the mortality due to malaria; in 1890, 14%
of all the deaths in Rome and the Campagna were attributed
to this cause; in 1905 the proportion had dropped to 3%.
Very large sums have been expended in a scientific system
of drainage and sub-drainage on both sides of the Tiber, and
the use of wire gauze mosquito nets for the doors and windows
of the humblest habitations in the Campagna has contributed
much to the present satisfactory result. The hyclgenic con-
ditions of Rome itself have greatly improved, largely through
the ceaseless efforts of Commendatore Baccelli, a distinguished
man of science, who repeatedly held office in the Italian
Ministry. The publication of exceedingly accurate graphic
figures in February 1900 shows the following facts. Ninety per
1,000 deaths occurred in 1871 from typhoid (the so-called "Roman
fever"), and the average has now fallen to a low constant.
Deaths from small-pox, formerly of alarming frequency, can
be said not to occur at all, and their numbers diminished
suddenly after the introduction of compulsory vaccination.

Charities and Education.—A great number of small charitable
institutions for children and old people have been founded, which
are organized on the most modern principles, and in many of these
charities the religious orders are represented. The most
notable is the Conventino di Soccorso, for the celebration
of the vows by the poor, which is managed by the municipality;
the oblates of St. Wilfrid, who have made a large industrial
school, and the Sancaioni, where the poor are taught to read
and write. The Rapitalo, or municipal orphanage, is situated
on the Esquiline, and has a narrow range of occupation;
the directors are the Rev. Mr. D'Arco, and the Rev. Mr. Pirovano;
the latter is a general for the poor, and a zealous advocate of
socialism. The majority of these industrial schools are under
the patronage of the various orders of religious gentlemen;
the Jesuits have a great part in the work, and two of the principal
orphans are maintained by them. The Ursulines have an
institution for the education of girls, the Daughters of Charity,
and the Daughters of St. Vincent have a great number of
institutions for secretaries, and they are associated with the
home for old people. The Daughters of St. Joseph have
a large convent on the Esquiline, with a connection with
the Church's mission, and the Daughters of St. Paul have
a school for boys, and a residence in the Esquiline. The
Daughters of St. Mary have an institute near the Esquiline,
and the Daughters of St. Joseph have an institute near the
Esquiline. The Daughters of St. John have an institute near the
Esquiline. The Daughters of St. John have an institute near the
Esquiline. The Daughters of St. John have an institute near the
Esquiline. The Daughters of St. John have an institute near the
Esquiline. The Daughters of St. John have an institute near the
Esquiline. The Daughters of St. John have an institute near the
Esquiline.
ROME

with the neighbouring dialects of the Sabines and Volscians and also of Etruscans; the oldest gods of Rome—Saturn, Jupiter, Juno, Diana—are all Latin. "Remus," "Tarquinius," "curia," are Latin titles and institutions. The primitive settlements, with their earthen ramparts and wooden palisades planted upon them out of reach both of human foes and of the malaria of the swampy low grounds, are only typical of the mode of settlement which the conditions of life dictated throughout the Latin plain. But tradition insists on the admixture of at least two non-Latin elements, a Sabine and an Etruscan. The question as regards the latter will be more fully discussed hereafter; it is enough to say here that while the evidence of nomenclature (Schulze, Geschichte der Lat. Eigennamen, Leipzig, 1904, p. 579, with the modifications suggested in the Classical Review, December 1907) shows that many Etruscan gentes were settled within the bounds of the early city, there is no satisfactory evidence that there was any large Etruscan strain in the Roman blood. With the Sabines it is otherwise. That union of the Palatine and Quirinal settlements which constituted so decisive a stage in the growth of Rome is represented as having been in reality a union of the original Latins with a band of Sabine invaders who had seized and held not only the Quirinal Hill, but the northern and nearest peak of the Capitoline Mount. The tradition was evidently deeply rooted. The name of the god Quirinus, from which that of the Quirinal Hill itself presumably sprang, was popularly connected with the Sabine town of Cures. The ancient worship connected with it were said to be Sabine. One of the three old tribes, the Titii, was believed to represent the Sabine element; the second and the fourth kings are both of Sabine descent. By the great majority of modern writers the substance of the tradition, the fusion of a body of Sabine invaders with the original Latins, is accepted as historical; and even Mommsen allowed its possibility, though he threw back the time of its occurrence to an earlier period than that of the union of the two settlements. We cannot here enter into the question at length, but some fairly certain points may be mentioned. The probability of Sabine raids and a Sabine settlement, possibly on the Quirinal Hill, in very early times may be admitted. The incursions of the highland Aemine tribes into the lowlands fill a large place in early Italian history. The Latins were said to have originally descended from the mountain glens near Reate. The invasions of Campania and of Magna Graecia by Sabine (more correctly Saenae) tribes are matter of history (see Samnites), and the Sabines themselves are represented as a restless highland people, ever seeking new homes in richer lands. In very early days they appear on the borders of Latium, in close proximity to Rome, and Sabine forays are familiar and frequent occurrences in the old legends. But beyond these general considerations recent inquiry enables us to advance to some few definite conclusions. (i) It may now be regarded as established beyond question that the patrician class at Rome sprang from a race other than that of the plebeians.

The title "rex" occurs on inscriptions at Lanuvium, Tusculum; Burdigala, M. Henzen, Bullantina dell'Inst. (1868), p. 159; Orelli, 2279; Corp. I. vii. 2, 15; Smith, Mommsen, supra, p. 248; i. 23, viii. 3; cf. Marquardt, Röm. Staatsverwaltung, i. 475: "curia," Serv. on Aen. i. 17; Marquardt i. 467.

The work of the 19th century, by Modeste, Introduction à l'histoire romaine (translated from the Russian by M. Delhez), Paris, 1917, superseded other authorities such as Helbig, Die Italiker in d. Poebene; Pohlmann, Anfänge Rom., Abeken, Mittel-Italien, ii seq.

The existence of a Tuscan quarter (Tusca vici) in early Rome may be inferred to not only from the presence of the Rome of Etruscan artists and craftsmen. But see ETRURIA, § Language.

Varro, L.L. vi. 51; Ibid. vi. 74; Schwuger i. 28 seq.; Ibid. i. 55; Livy i. 13; Mommsen, Röm. Gesch. ii. 33; Schwuger (R.G. i. 428) accepted the tradition of a Sabine settlement on the Quirinal, and considered that in the united state the Sabine element predominated. Volquardsen (Kreis. Mün., xxxiii, 539) believed in a complete Sabine conquest; and so did Zilleter (Latinum u. Rom., Leipzig, 1878), who, however, placed it after the expulsion of the Tarquins.

The Sabines in Rome.

ANCIENT HISTORY

I. The Beginnings of Rome and the Monarchy.

Both the city and the state of Rome are represented in tradition as having been gradually formed by the fusion of separate communities. The original settlement of Romulus is said to have been limited to the Palatine Mount. With this were united before the end of his reign the Capitoline and the Quirinal. Tullus Hostilius added the Caelian, Ancus Martius the Aventine, and finally Servius Tullius included the Esquiline and Viminal, and enclosed the whole seven hills with a stone wall. The growth of the state closely followed that of the city. The original Romans on the Palatine were added successively the Sabine followers of King Tatinus, Albans transplanted by Tullus, Latins by Ancus, and lastly the Etruscan comrades of Caecus. This tradition is supported by other and more positive evidence. The race of the Luperces on February 15 was in fact a purification of the boundaries of the "ancient Palatine town," the "square Rome" of Ennius, and the course taken is that described by Tacitus as the "pomerium" of the city founded by Romulus. On the Esquiline, Varro mentions an "ancient city" and an "earthen rampart," and the festival of the Septimontium is evidence of a union between this settlement and that on the Palatine. The fusion of these "element" on the Quirinal Hill is also attested by trustworthy traditions, and in particular, is taken by the procession of the Argei represents the enlarged boundaries of these united communities. Lastly, the Servian aeger still remains as a witness to the final enclosure of the various settlements within a single ring-wall. The united community thus formed was largely of Latin descent. Indications of this are not wanting even in the traditions themselves: King Faunus, who rules the Aborigines on the Palatine, is Latin; "Latini" is the name ascribed to the united Aborigines and Trojans; the immediate progenitors of Rome are the Latin Lavinium and the Latin Alba. Much evidence in the language, the religion, the institutions and the civilization of early Rome points to this view. The speech of the Romans is from the first Latin, though showing many traces of contact with the neighbouring dialects of the Sabines and Volscians and also of Etruscans; the oldest gods of Rome—Saturn, Jupiter, Juno, Diana—are all Latin. "Remus," "Tarquinius," "curia," are Latin titles and institutions. The primitive settlements, with their earthen ramparts and wooden palisades planted upon them out of reach both of human foes and of the malaria of the swampy low grounds, are only typical of the mode of settlement which the conditions of life dictated throughout the Latin plain. But tradition insists on the admixture of at least two non-Latin elements, a Sabine and an Etruscan. The question as regards the latter will be more fully discussed hereafter; it is enough to say here that while the evidence of nomenclature (Schulze, Geschichte der Lat. Eigennamen, Leipzig, 1904, p. 579, with the modifications suggested in the Classical Review, December 1907) shows that many Etruscan gentes were settled within the bounds of the early city, there is no satisfactory evidence that there was any large Etruscan strain in the Roman blood. With the Sabines it is otherwise. That union of the Palatine and Quirinal settlements which constituted so decisive a stage in the growth of Rome is represented as having been in reality a union of the original Latins with a band of Sabine invaders who had seized and held not only the Quirinal Hill, but the northern and nearest peak of the Capitoline Mount. The tradition was evidently deeply rooted. The name of the god Quirinus, from which that of the Quirinal Hill itself presumably sprang, was popularly connected with the Sabine town of Cures. The ancient worship connected with it were said to be Sabine. One of the three old tribes, the Titii, was believed to represent the Sabine element; the second and the fourth kings are both of Sabine descent. By the great majority of modern writers the substance of the tradition, the fusion of a body of Sabine invaders with the original Latins, is accepted as historical; and even Mommsen allowed its possibility, though he threw back the time of its occurrence to an earlier period than that of the union of the two settlements. We cannot here enter into the question at length, but some fairly certain points may be mentioned. The probability of Sabine raids and a Sabine settlement, possibly on the Quirinal Hill, in very early times may be admitted. The incursions of the highland Aemine tribes into the lowlands fill a large place in early Italian history. The Latins were said to have originally descended from the mountain glens near Reate. The invasions of Campania and of Magna Graecia by Sabine (more correctly Saenae) tribes are matter of history (see Samnites), and the Sabines themselves are represented as a restless highland people, ever seeking new homes in richer lands. In very early days they appear on the borders of Latium, in close proximity to Rome, and Sabine forays are familiar and frequent occurrences in the old legends. But beyond these general considerations recent inquiry enables us to advance to some few definite conclusions. (i) It may now be regarded as established beyond question that the patrician class at Rome sprang from a race other than that of the plebeians.

The title "rex" occurs on inscriptions at Lanuvium, Tusculum; Burdigala, M. Henzen, Bullantina dell'Inst. (1868), p. 159; Orelli, 2279; Corp. 1. vii. 2, 15; Smith, Mommsen, supra, p. 248; i. 23, viii. 3; cf. Marquardt, Röm. Staatsverwaltung, i. 475: "curia," Serv. on Aen. i. 17; Marquardt i. 467.

The work of the 19th century, by Modeste, Introduction à l'histoire romaine (translated from the Russian by M. Delhez), Paris, 1917, superseded other authorities such as Helbig, Die Italiker in d. Poebene; Pohlmann, Anfänge Rom., Abeken, Mittel-Italien, ii seq.

The existence of a Tuscan quarter (Tusca vici) in early Rome may be inferred to not only from the presence of the Rome of Etruscan artists and craftsmen. But see ETRURIA, § Language.

Varro, L.L. vi. 51; Ibid. vi. 74; Schwuger i. 28 seq.; Ibid. i. 55; Livy i. 13; Mommsen, Röm. Gesch. ii. 33; Schwuger (R.G. i. 428) accepted the tradition of a Sabine settlement on the Quirinal, and considered that in the united state the Sabine element predominated. Volquardsen (Kreis. Mün., xxxiii, 539) believed in a complete Sabine conquest; and so did Zilleter (Latinum u. Rom., Leipzig, 1878), who, however, placed it after the expulsion of the Tarquins.

See Mommsen, R.G. (7th ed.), i. 51.

See Latin Language.
This was long ago recognized by Schweger (see his Römische Geschichte, passim) on the sufficient ground of the great religious cleavage between the two orders. Such jealousy of mutual contact in religion at least some further years is apparent, all though hints of the city very rarely, if ever, springs from any other source than a real difference of race. This point was developed by Professor W. Ridgeway in his Who were the Romans? (London, 1908), where he points out (a) that the deities tended by the three greater or patrician flamen, namely, Dialis, Martialis, Quirinalis, were all closely connected with the Sabines; (b) further, that the patrician form of marriage, the highly religious ceremony called Confrarioatto, differed entirely from the other forms, Usus and Coempio, which there is reason to attribute to a plebeian origin; (c) that the arms, especially the round shield, carried by the first class in the originally military constitution of Servius Tullius (see below), are characteristic of the warriors of Central Europe in the Early Iron and Bronze Age, whereas those of the remaining classes can be shown to have been in general use during the immediately preceding period in the Mediterranean lands.

For other archaeological evidence separating the patricians from the plebeians, and combining the patricians closely with the Sabines the reader must be referred to Ridgeway’s essay. It is, however, well to make special mention here of the tradition, which is given by Livy (ii. 16. 4), and is undated but not the less probable for being a non-analastic tradition, preserved in the gens itself, of the prompt welcome given to the Sabine Appius Claudius, the founder of the haughtiest of all the Roman noble families, by the patricians of Rome and his immediate admission to all their political privileges. Ridgeway points out that this implies, at that early time, a substantial identity of race.

On the linguistic side of the question it is well to mention for clearness’ sake that this Sabine or patrician class marked its ascendency all over Central and Southern Italy, from the 6th century B.C. by Livy, to the 4th century B.C. for other names with the suffix -no which it frequently imposed also upon the communities whom it brought under its influence. Sabini (earlier Safini), Romani, Latini, Sicelani, Arcisci, Marrucini, and the like are all names formed in this way (see further Sabini).

2. It may also now be regarded as certain that what we may call the Lower or Earlier Stratum (or Strata) of population in Rome, themselves spoke a language which was as truly Indo-European as the language of their Sabine conquerors. In the article Volsci will be found evidence for the conclusion that the language of what has been there entitled the Co-Folk was not less certainly Indo-European, and in some respects probably a less modified form of Indo-European, than that of the Sabines. A number of the names formed with the -co suffix and with the -ait suffix (which is frequent in the same districts) contain unmistakably Indo-European words such as Graecisca, Marca, dea Marica, Volsci, Cisnates, Soracate, Interamnites, Auxamates. The fusion of this earlier population with the patricians is far easier to imagine when it is recognized that the two parties spoke kindred though by no means identical languages. It is the essentially Indo-European character of the early inhabitants of the Latin plain which has led many scholars to doubt that there was any racial distinction at all between patricians and plebeians, but the increase of knowledge of the dialects spoken in the different regions of Italy has now enabled us to judge this question with very much fuller evidence.

3. There arises, however, the important question or questions as to the origin, or at least the ethnic connexions of this earlier stratum. The task of the historic inquirer will not be completely performed until at least some further progress has been made in connecting this earlier population of the western coast of Italy, on the one hand, with one or more of the early races (see Siculi, Veneti, Liguria, Pelasgians) whom tradition declares to have once inhabited the soil of Latium; and on the other, with the people or peoples whom archaeological research reveals to us as having left behind them different strata of remains, all earlier than the Iron or Roman Age, both in Latium and in other parts of Italy. Professor Ridgeway has taken a short way with these problems which may prove to be the true one; he classes together as Ligurian all pre-Safe inhabitants of Italy save such elements as, like the Etruscan, can be shown to have invaded it over sea (see Etruria, § Language). This is one of the most promising fields of investigation now open to scholars, but in view of the confused and mutilated shape in which the traditions current in ancient times have come down to us, it demands an exceedingly careful scrutiny of the archaeological and the linguistic evidence, and exceedingly cautious judgment in combining them. The point of outstanding importance is to determine whether the earlier Indo-European population is to be regarded as having been in Italy from the beginning of human habitation. Archaeologists generally like W. Heibig (Die Itulker der Poebene) and more recently B. Modestov (Introduction à l'histoire romaine, Paris, 1907) have been inclined to regard the Ligurians as the most primitive population of Italy, but to distinguish them sharply from the people who built the Lake Settlement and File Dwellings, which appear (with important variations of type):—(1) in the western half of the valley of the Po; (2) in the eastern half of the same; (3) in Picenum; (4) in Latium; and (5) as far south as Tarentum. One of the most important points in the identification is the question of the method of burial employed at different epochs by the different communities. (See the works already cited, with that of O. Montelius, La Civilisation primitive en Italie.)

The populus Romanus was, we are told, divided into three tribes, Ramnes, Tities and Luceres, and into thirty curiae. The three names, as Schulze has shown (Lat. Eigennamen, p. 560), are neither more nor less than the names of three Etruscan gentes (whether not derived from Safini or Latin originals), and the tradition is a striking result of the Etruscan domination in the 6th century B.C., which we shall shortly consider.

Of far greater importance is the division into curiae. In Cicero’s time there were still curies, curial festivals and curial assemblies, and modern authors are unquestionably right in regarding the curia as the keystone of the primitive political system. It was a primitive association held together by participation in common sacra, and possessing common festivals, common priests and a common chapel, hall and hearth. As separate associations the curiae were probably older than the Roman state, but, however this may be, it is certain that of this state when formed they constituted the only effective political subdivisions. The members of the thirty curiae form the populus Romanus, and the earliest known condition of Roman citizens, Saburum, partnership in the curia sacra. Below the curia there was no other political division, for there is no reason to believe that the curia was ever formally subdivided into a fixed number of gentes and families.

At their head was the rex, the ruler of the united people. The Roman “king” is not simply either the hereditary and patriarchal chief of a clan, the priestly head of a community bound together by common sacra, but the elected magistrate of a state, but a mixture of all three. In the tradition connecting the Ramnes with Romulus and the Titles with Tatius is as old as Ennius (Varro, L.L. v. 55). The best authorities on the question, earlier than Schulze’s epoch-making treatise, were Schwieger i. 505, and Volquardsen, Röm. Mus. xxxiii. 538.

They are traditionally connected only with the senate of 300 patres, with the primitive legion of 3000, with the vestal virgins, and with the Consuls and Praetors. Schlegel, Hist. ii. 6; Festus 344: Mommsen i. 41, 74, 75; Genz, Patriziensch. Rom. 90).

It is possible that the curiae were originally connected with separate localities; cf. such names as Forienisi, Velienisi (Fest. 174. 419; Gill. ii. 21)

Nieber’s supposition of ten gentes in each curia has nothing in its favour but the confirmed statement of Dionysius as to the purely military tribes (Dionys. ii. 7; cf. Müller, Philologus, xxxiv. 96).

Rubino, Genz and Lamezi insisted on the hereditary patriarchal character of the kingship. Hence on its priestly side, Schwieger on its elective. Mommsen seems to the nearest view taken in the text, but
later times, when no "patrician magistrates" were forthcoming to hold the elections for their successors, a procedure was adopted which was believed to represent the manner in which the early kings had been appointed. In this procedure the ancient members of the old gentes and their heirs, the importance of maintaining an unbroken line of continuity of the sacra, on the transmission and observance of which the welfare of the community depended, and thirdly the rights of the freemen, are all recognized. On the death of a king, the auspicia, and with them the supreme authority, revert to the council of elders, the patres, as representing the gentes. By the patres an interrex is appointed, who in turn nominates a second; by him, or even by a third or fourth interrex, a new king is selected in consultation with the patres. The king designate is then proposed to the freemen assembled by their curiae for their acceptance, and finally their formal acceptance is ratified by the patres, as a security that the sacra of which they are the guardians have been respected. Thus the king is in the first instance selected by the representatives of the old gentes, and they ratify his appointment. In form he is nominated directly by a predecessor from whose hands he receives the auspicia. But it is necessary also that the choice of the patres and the nomination of the interrex should be confirmed by a solemn vote of the community.

It is useless to attempt a precise definition of the prerogatives of the king when once installed in office. Tradition ascribes to him a position and powers closely resembling those of the hereditary kings of Greece. He rules for life, and he is the sole ruler, unaided by written statutes. He is the supreme judge, settling all disputes and punishing wrongdoers even with death. All other officials are appointed by him. He imposes taxes, distributes lands and erects buildings. Senate and assembly meet only when he convenes them, and meet for little else than to receive communications from him. In war he is absolute leader, and finally he is also the religious head of the community. It is his business to consult the gods on its behalf, to offer the solemn sacrifices and to announce the days of the public festivals. Hard by his house was the common hearth of the state, where the vestal virgins cherished the sacred fire.

By the side of the king stood the senate, or council of elders. In the descriptions left us of the primitive senate, as in those of the rex, we can discover traces of a transition from an earlier state of things when Rome was only an assemblage of clans or village communities, allied indeed, but each still ruled by its own chief and headmen, to one in which these groups have been fused into a single state under a common ruler. On the one hand the senate appears as a representative council of chiefs, with inalienable prerogatives of its own, and claiming to be the ultimate depositary of the supreme authority and of the sacra connected with it. The selection of the patres, they are taken from the leading gentes; they hold their seats for life; to them the auspicia revert on the death of a king; they appoint the interrex from their own body, are consulted in the choice of the new king, and their sanction is necessary to ratify the vote of the assembled freemen. On the other hand, they are no longer supreme.

They cannot appoint a king but with the consent of the community, and their relation to the king when appointed is one of subordination. Vacancies in their ranks are filled up by them, and they can but give him advice and counsel when he chooses to consult them.

The popular assembly of united Rome in its earliest days was that in which the freemen met and voted by their curiae (comitia curiata). The place of assembly was in the Comitium at the north-east end of the Forum, the assembly, at the summons and under the presidency of the king, or, failing him, of the interrex. By the rex or the interrex the question was put, and the voting took place curiatis, the curiae being called up in turn. The vote of each curia was decided by the majority of individual votes, and a majority of the votes of the curiae determined the final result. But the occasions on which the assembly could exercise its power must have been few. Their right to elect magistrates was apparently limited to the acceptance or rejection of the king proposed by the interrex. Of the passing of laws, in the later sense of the term, there is no trace in the kingly period. Dionysius's statement that they voted on questions of war and peace is improbable in itself and unsupported by tradition. They are indeed represented, in one instance, as deciding a capital case, but it is by the express permission of the king and not of right. The assemblies of the people were also, and probably more frequently, convened for other purposes. Not only did they meet to hear from the king the announcement of the high days and holidays for each month, and to witness such solemn religious rites as the inauguration of a priest, but their presence (and sometimes their vote) was further required to authorize and attest certain acts, which in a later age assumed a more private character. The disposal of property by will and the solemn renunciation of family or gentile sacra could only take place in the presence of the assembled freemen, while for adoption (adrogatio) not only their presence but their formal consent was necessary.

A history of this early Roman state is out of the question. The names, dates and achievements of the first four kings are all too unsubstantial to form the basis of a sober narrative; a few points only can be considered as fairly well established. If we except the long eventless reign ascribed to King Numa, tradition represents the first kings as incessantly at war with their immediate neighbours. The details of these wars are no doubt mythical; but the implied condition of continual struggle, and the narrow range within which the struggle is confined, may be accepted as true. The picture drawn is that of a small community, with a few square miles of territory, at deadly feud with its nearest neighbours, within a radius of some 12 m. round Rome. Nor, in spite of the repeated victories with which tradition credits Romulus, Anius and Tullus, do we seem there to have been any real extension of Roman territory except towards the sea. Fidenae remains Etruscan; the Sabines continue masters up to the Anio; Praeneste, Gabii and Tusculum are still untouched; and on this side it is doubtful if Roman territory, in spite of the possible destruction of Alba, extended to a greater distance than the sixth milestone from Rome. Along the course
of the Tiber below the city there was a decided advance. The fortification of the Janiculum, the building of the pons sublicius, the foundation of Ostia and the acquisition of the salt-works near the sea may all be safely ascribed to this early period. Closely connected, too, with the control of the Tiber from Rome to the sea was the subjugation of the petty Latin communities lying south of the river; and the tradition of the conquest and destruction of Politorium, Tellenea and Ficana is confirmed by the absence in historical times of any Latin communities in this district.

With the reign of the fifth king Tarquiniius Priscus a marked change takes place. The traditional accounts of the last three kings not only wear a more historical air than those of the first four, but they describe something like a transformation of the Roman city and state. Under the rule of these latter kings the separate settlements are for the first time enclosed with a rampart of colossal size and extent. The low grounds are drained, and a forum and circus elaborately laid out; on the Capitoline Mount a temple is erected, the massive foundations of which were an object of wonder even to Pliny. To the same period are assigned the rededication of the city area into four new districts and the introduction of a new military system. The kings increase in power and surround themselves with new splendour. Abroad, too, Rome suddenly appears as a powerful state ruling far and wide over southern Etruria and Latium. These startling changes are, moreover, ascribed to kings of alien descent, who one and all ascend the throne in the teeth of established constitutional forms. Finally, with the expulsion of the last of them—the younger Tarquin—comes a sudden shrinkage of power. At the commencement of the Republic Rome is once more a comparatively small state, with hostile and independent neighbours at her very doors. It is impossible to doubt the conviction that the true explanation of this phenomenon is to be found in the supposition that Rome during this period passed under the rule of powerful Etruscan lords. In the 7th and 6th centuries B.C., and probably earlier still, the Etruscans appear as ruling widely outside the limits of Etruria proper. They were supreme in the valley of the Po until their power there was broken by the irruption of Celtic tribes from beyond the Alps, and while still masters of the plains of Lombardy they established themselves in the rich lowlands of Campania, where they held their ground until the capture of Capua by the Samnite highlanders in 423 B.C. It is on the face of it improbable that a power which had extended its sway from the Alps to the Tiber, and from the Liris to Surrentum, should have left untouched the intervening stretch of country between the Tiber and the Liris. And there is abundant evidence of Etruscan influence in Latium. According to Dionysius there was a time when the Latins were known to the Greeks as Tyrrenians, and Rome as a Tyrrenian city. When Aeneas landed in Italy the Latins were at feud with Turnus (Turnhenos)

people swore that never again should a king rule in Rome. Freed from the tyrant, they chose for themselves two yearly magistrates who should exercise the supreme authority, and thus the Republic of Rome was founded. Three times the banished Tarquin strove desperately to recover the throne he had lost. First of all the men of Veii and Tarquinii marched to his aid, but were defeated in a pitched battle on the Roman frontier. A year later Lars Porsena, prince of Clusium, at the head of all the powers of Etruria, appeared before the gates of Rome, and closely besieged the city, until, moved by the valor of his foe, he granted honourable terms of peace and withdrew. 8 Once again, by Lake Regillus, the Romans fought victoriously for their liberty against Tarquin’s son-in-law Mamilius, prince of Tusculum, and chief of the Latin name. Mamilius was slain; Tarquin in despair found a refuge at Cumae, and there soon afterwards died.

So, in brief, ran the story of the flight of the kings, as was told by the chroniclers whose story Livy reports, though with explicit and repeated notes of reserve. Its details are most of them fabulous; it is crowded with inconsistencies and improbabilities; there are no trustworthy dates; the names even of the chief actors are probably fictitious, and the hand of the improver, Greek or Roman, is traceable throughout. 9 But there is room for doubting the main facts of the emancipation of Rome from the rule of alien princes and the final abolition of the tyrannical office.

II. The Republic.

Period A: 509–265 b.c.—(a) The Struggle between the Orders.  —It is characteristic of Rome that the change from monarchy to republic 10 should have been made with the least possible disturbance of existing forms. The title of king was retained, though only as that of a priestly officer (rex sacrorum) to whom some of the religious functions of the former kings were transferred. The two annually elected consuls, or praetors, 11 were regarded as joint heirs of the full kingly authority, and as holding the imperium, and the correlative right of taking the auspices, by direct transmission from the founder of the city. They were, it is true, elected or designated by a new assembly, by the army of landholders voting by their classes and centuries (comitia centuraria), and to this body was given also the right of passing laws; nevertheless it was still by a vote of the thirty Tribes that the consul (legatus) who was annually conferred on the magistrates chosen by the centuries of landholders, and both the choice of magistrates and the passing of laws still required the sanction of the patrician senators (patrum auctoritas). 12 Nor, lastly, were the legal prerogatives of the senate altered, although it is probable that before long plebeians were admitted to seats, if not to votes, and though its importance was gradually increased by the substitution of an annual magistracy for the lifelong rule of a single king. But the

10 Period A: 509–265 B.C.

11 Livy ii. 9–14. Pliny (N.H. 34, 14) and Tacitus (Ann. iii. 72) imply the existence of a tradition, possibly that of "Tuscan annalists," according to which Porsena actually made himself master of Rome. Nevertheless, the whole story is probably founded by Schwyzer (ii. 181 seq.) and Zöller (Latiun u. Rom. p. 180).

12 See the exhaustive criticism in Schwyzer (ii. pp. 66–203).

The traditional account of early republican history, given in annalistic form by Livy, has been subjected to severe criticism in recent times, notably by Pox in his Storia di Roma, vols. i. and ii.

It is true that the deahe of contemporary documents, especially for the period before the sack of Rome by the Gauls (390 B.C.), must have led to the filling of gaps by episodes drawn mainly from popular traditions, and it is therefore impossible to guarantee the accuracy of the narrative in details. Nevertheless, the general truth of the story of Rome's early wars and constitutional growth cannot be seriously questioned.

13 Schwyzer (ii. 92) suggests that the dictatorship formed an intermediate step between the monarchy and the consulate; cf. Ihne, Röm. Forsch. 42.

14 The consul were originally styled praetores, as stated by Varro, op. Nom. p. 23, and Liv. iii. 55; cf. Cic. Legg. viii. 3, 8. When additional praetors were created, the two originally appointed were called praetores maximini and hence statapes maximini or simply statapes in Greek.

15 The view of the patres auctoritas here adopted is that taken by T. Mommsen (Forsch. 1).
abolition of the monarchy brought with it a change of the utmost importance in the actual working of the constitution. Though the distinction between patricians and plebeians was at least as old as the state itself, it is not until the establishment of the Republic that it plays any part in the history of Rome. No sooner, however, was the overshadowing authority of the king removed than a struggle commenced between the two orders which lasted for more than two centuries. It was in no sense a struggle between a conquering and a conquered class, or between an exclusive citizen body and an unenfranchised mass outside its pale. Patricians and plebeians were equally citizens of Rome, sprung from the same race and speaking the same tongue (but see above). The former were the members of those ancient gentes which had possibly been once the chiefly families in the small communities which preceded the united state, and which claimed by hereditary right a privileged position in the community. Only patricians could sit in the council of patres, and hence probably the name given to their order. To their representatives the supreme authority reverted on the death of the king; the due transmission of the auctoritas and the public worship of the state gods were their special care; and to them alone were known the traditional usages and forms which regulated the life of the people from day to day. To the plebs (the multitude, plebs) belonged all who were not members of some patrician gens, whether independent freemen or attached as "clients" to one of the great houses. The plebeian was a citizen, with civil rights and a vote in the assembly of the curies, but he was excluded by ancient custom from all share in the higher honours of the state, and intermarriage with a patrician was not recognized as a properly legal union (see PATRICIANS).

The revolution which expelled the Tarquins gave the patricians, who had mainly assisted in bringing it about, an overwhelming ascendency in the state. The plebs had indeed gained something. Not only is it probable that the strictness of the old tie of clientio had somewhat relaxed, and that the number of the clientes was smaller and their dependence on patrician patrons less complete, but the ranks of the plebs had, under the later kings, been swelled by the admission of conquered Latins, and the freeholders among these had with others been enrolled in the Servian tribes, classes and centuries. The establishment of the Republic invested this military levy of landholders with political rights as an assembly, for by their votes the consuls were chosen and laws passed, and it was the plebs which remained at present as the main strength of the plebs in the struggle that followed. But these gains were greater in appearance than in reality. The plebeian landholders commanded only a minority of votes in the comitia centurialia. In their choice of magistrates they were limited to the patrician candidates nominated by patrician presiding magistrates, and their choice required confirmation not only by the older and smaller assembly of the curiae, in which the patricians and their clients predominated, but also by the patrician patres. They could only vote on laws proposed by patrician consuls, and here again the subsequent sanction of the patres was necessary. The whole procedure of the comitia was in short absolutely in the hands of their patrician predecessors, and liable to every sort of interruption and suspension from patrician pontiffs and augurs (for details see further COMITIA and SENATE).

But these political disabilities did not constitute the main grievance of the plebs in the early years of the Republic. What they fought for was protection for their lives and liberties, and the object of attack was the despotic authority of the

patrician magistrates. The consuls wielded the full imperium of the kings, and against this "consular authority" the plebeian, though a citizen, had no protection and no appeal, nor were matters improved when for the two consuls was substituted in some emergency a single, all-powerful, irresponsible dictator.

The history of this struggle between the orders opens with a concession made to the plebs by one of the consuls themselves, a concession possibly due to a desire to secure the allegiance of the plebeian landholders, who formed the backbone of the army. In the first year of the Republic, according to the received chronology, P. Valerius Publicola or Poplicola carried in the comitia centurialia his famous law of appeal. It enacted that no magistrate, saving only a dictator, should execute a capital sentence upon any person without a public trial. This law was the first step on the road to an appeal by the assembly of the centuries. But, though the "right of appeal" granted by this law was justly regarded in later times as the greatest safeguard of a Roman's liberties, it was by no means at first so effective a protection as it afterwards became. For not only was the operation of the law limited to the bounds of the city, so that the consuls in the field or on the march was left as absolute as before, but no security was provided for its observance even within the city by consuls resolved to disregard it.

It was by their own efforts that the plebeians first obtained any real protection against magisterial despotism. The traditional accounts of the first secession are confused. The first secession was from the tribuni plebis, and contradictory, but its causes and results are tolerably clear. The seceders were the plebeian tribunes (tribuni plebeii, tribunalia). Indignant at the delay of the promised reforms, they ignored the order given them to march against Volsci and Aequi, and instead entrenched themselves on a hill across the Anio, some 3 m. from Rome, and known afterwards as the Mons Sacer. The frightened patricians came to terms, and a solemn agreement (lex sacrata) was concluded between the orders, by which it was provided that henceforth the plebeians should have annual magistrates of their own called tribunes (tribuni plebeii), members of their own order, who should be authorized to protect them against the consuls, and a sentence was invoked upon the man who should injure or impede the tribune in the performance of his duties. The number of tribunes was at first two, then five; before 440 B.C. it had been raised to ten. The tribune is an institution which has no parallel in history. The tribune was not, and, strictly speaking, never became, a magistrate of the Roman people. His one proper prerogative was that of granting protection to the oppressed plebeian against a patrician officer. This prerogative (jus auxilia) was secured to him, not by the ordinary constitution, but by a special compact between the orders, and was protected by the ancient oath (vetus jusjurandum), which invoked a curse upon the violator of a tribune. This exceptional and anomalous right the tribunes could only exercise in person, within the limits of the "pomerium," and against individual acts of magisterial oppression. It was only gradually that it expanded into a wide power of interference with the whole machinery of government, and was supplemented by the legislative powers which rendered the tribunate of the last century B.C. so formidable (see TRIBUNATE).

But from the first the tribunes were for the plebs not only protectors but leaders, under whom they organized themselves in opposition to the patricians. The tribunes convened le
d'assemblies of the plebs (comitia plebeii), and carried on in

LIVY

Lex Valeria de provocatione, P.f. 118 sqq. 11

Cic. De Rep. ii. 44. "contra consulare imperium creavit."
plebeian organization was materially advanced by the Pubilian law of 421 B.C., which appears to have formally recognized as lawful the plebeian consilia, and established also the tribune’s right of popular resолution, i.e. to propose and carry resolutions in them. These assemblies were tribuna, or, in other words, the voting in them took place not by curies or centuries but by tribes. In them, lastly, after the Pubilian law, if not before, the tribunes were annually elected. By this law the foundations were laid both of the powerful concilia plebis of later days and also of the legislative and judicial prerogatives of the tribunes. The patricians maintained indeed that resolutions (plebisita) carried by tribunes in the concilia plebis were not binding on their order, but the moral weight of such resolutions, whether they affirmed a general principle or pronounced sentence of condemnation on some single patrician, was no doubt considerable.

The next stage in the struggle is marked by the attempt to substitute a public written law for unwritten usage. The proposal of C. Terentullus Arsa (422 B.C.) to appoint a plebeian commission to draw up laws restricting the powers of the consuls was resolutely opposed by the patricians, but after ten years of bitter party strife a compromise was effected. A commission of ten patricians was appointed, who should frame and publish a code of law binding equally on both the orders. These decemvirs were to be sole and supreme magistrates for the year, and the law of appeal was suspended in their favour. The code which they promulgated, the famous XII. Tables, owed little of its importance to any novelties or improvements contained in its provisions. For the most part it seems merely to have reaffirmed existing usages and laws (see Roman Law). But it imposed, as it was intended to do, a check on the arbitrary administration of justice by the magistrates. With the publication of the code the proper work of the decemvirs was finished; nevertheless, for the next year a fresh decemvirate was elected, and it is conceivable that the intention was permanently to substitute government by an irresponsible patrician council of ten for the old constitution. However this may have been, the tyranny of the decemvirs themselves was fatal to the continuance of their power. We are told of a second secession of the plebs, this time to the Janiculum, and of negotiations with the senate, the result of which was the enforced abdication of the decemvirs.

The plebs joyfully chose for themselves tribunes, and in the concilia centuriata two consuls were created. But this restoration of the old régime was accompanied by legislation which made it an important crisis in the history of the struggle between the orders. With the fall of the decemvirate this struggle enters upon a new phase.

The tribunes appear as at once more powerful and more strictly constitutional magistrates; the plebeian concilia take their place by the side of the older assemblies; and finally this improved machinery is used not simply in self-defence against patrician oppression but to obtain complete political equality. This change was no doubt due in part to circumstances outside legislation, above all to the expansion of the Roman state, which swelled the numbers and added to the social importance of the plebs as compared with the dwindling numbers and weight of the once prominent patrician gens. Still the legislation of 449 clearly involved more than a restoration of the old form of government. The Valerian-Horatian laws, besides reaffirming the right of appeal and the inviolability of the tribunes, improved the position of the plebeian assemblies by enacting that plebisita passed in them, and, as seems probable, approved by the patres, should be binding on patricians as well as plebeians.

6 Livy iii. 55. quum velut in controversio jure esset, tenenturum
7 Luscinii Stolo, Gatus, and L. Sextius, came forward with proposals which united all sections of the plebs in their support. Their proposals were as follows: 1) that consuls and not consular tribunes be elected; 2) that one consul at least should be a plebeian; 3) that the priestly college, which had the charge of the Silviline books, should consist of ten members instead of two, and that of these half should be plebeians; 4) that no single citizen should hold in occupation more than 500 acres of the common lands, or pasture upon them more than 100 head of cattle and 500 sheep; 5) that all landowners should employ a certain amount of free as well as slave labour on their estates; 6) that interest already paid on debts should be deducted from the interest of new debts. The last three proposals were obviously intended to meet the patres plebiscita legem consimilis cens chorub, ut quod tributum plebs iussum populi tenebat, qua lege tribunicia rogationibus telum acrierrimum datum est. What were the precise conditions under which a plebiscitum became law can only be conjectured. The control of the patres under legislation certainly remained effective until 287 B.C. (See below.)
8 After the decemvirate, the tribunes no longer pronounce capital sentences. They propose fines, which are confirmed by the consili tributa.
9 See Livy iv. 6; cf. Mommsen, Staatsrecht, ii. 181.
10 Mommsen, Staatsrecht, ii. 331.
11 Livy vi. 35, 42; Appian, B.C. i. 8.

By this law the tribunes obtained a recognized initiative in legislation. Henceforth the desired reforms were introduced and carried by tribunes in what were now styled consilia tributa, and, if sanctioned by the patres, became laws of the state. From this period, too, must be dated the legalization at any rate of the tribune’s right to impeach any citizen before the assembly of the tribes. Henceforward there is no question of the tribune’s right to propose to the plebs to impose a fine, or of the validity of the sentence when passed. The efficiency of these new weapons of attack was amply proved by the subsequent course of the struggle. Only a few years after the Valerian-Horatian legislation came the lex Canulea, itself a plebiscitum (445 B.C.), by which mixed marriages between patricians and plebeians were declared lawful, and the social exclusiveness of the patrician broken down. In the same year with this measure, and like it in the interests primarily of the wealthier plebeians, a vigorous attack commenced on the old patrician monopoly of the consulship, and round this strong point of patrician ascendancy the conflict raged until the passing of the Licinian laws in 367. The original proposal of the tribune Gaius Canuleius, in 445, that the people should be allowed to elect a plebeian consul and that the consuls should be by a compromise. The people determined that for the next year, in the stead of consuls, six military tribunes with consular powers should be elected, and that the new office should be open to patricians and plebeians alike. The consulship was thus for the time saved from pollution, as the patricians phrased it, but the growing strength of the plebs is shown by the fact that in fifty years out of the seventy-eight between 444 and 366 they succeeded in obtaining the election of consular tribunes rather than of consuls.

Despite, however, these discouragements, the patricians fought on. Each year they strove to secure the creation of consuls rather than consular tribunes, and failing this strained every nerve to secure for their own order at least a majority among the latter. Even the institution of the censorship (435), though rendered desirable by the increasing importance and complexity of the census, was, it is probable, due in part to their desire to discount beforehand the threatened loss of the consulship by diminishing its powers. Other causes, too, helped to protract the struggle. Between the wealthier plebeians, who were for the most part no longer freeholders, whose minds were set rather on allotments of land, there was a division of interest of which the patricians were not slow to take advantage, and to this must be added the pressure of war. The death struggle with Veii and the sack of Rome by the Gauls absorbed for the time all the energies of the community. In 377, however, two of the tribunes, C. Licinius Stolo (see LICINUS STOLO, GATUS) and L. Sextius, came forward with proposals which united all sections of the plebs in their support. Their proposals were as follows: 1) that consuls and not consular tribunes be elected; 2) that one consul at least should be a plebeian; 3) that the priestly college, which had the charge of the Silviline books, should consist of ten members instead of two, and that of these half should be plebeians; 4) that no single citizen should hold in occupation more than 500 acres of the common lands, or pasture upon them more than 100 head of cattle and 500 sheep; 5) that all landowners should employ a certain amount of free as well as slave labour on their estates; 6) that interest already paid on debts should be deducted from the interest of new debts. The last three proposals were obviously intended to meet the patres plebiscita legem consimilis cens chorub, ut quod tributum plebs iussum populi tenebat, qua lege tribunicia rogationibus telum acrierrimum datum est. What were the precise conditions under which a plebiscitum became law can only be conjectured. The control of the patres under legislation certainly remained effective until 287 B.C. (See below.)
demands of the poorer plebeians, and to secure their support for the first half of the scheme. Ten years of bitter conflict followed. But at last, in 367 B.C., the Licinian rostra became law, and one of their authors, L. Sextius, was created the first plebeian consul. For the moment it was some consolation to the patricians that they not only succeeded in detaching from the consulship the administration of civil law, which was entrusted to a separate officer, praetor urbanus, to be elected by the comitia of the centuries, with an understanding apparently that he should be a patrician, but also obtained the institution of two additional aediles (aediles curules), who were in like manner to be members of their own order. With the opening of the consulship, however, the issue of the long contest was virtually decided, and the next eight years witnessed a rapid succession of plebeian victories. Now that a plebeian consul might preside at the elections, the main difficulty in the way of the nomination and election of plebeian candidates was removed. The proposed patrician monopoly of the new curule aedilship was almost instantly abandoned. In 356 the first plebeian was made dictator; in 350 the censorship, and in 337 the praetorship were filled for the first time by plebeian and patrician; in 330, by the lex Ogulnia, even the sacred colleges of the pontiffs and augurs, the old strongholds of patrician supremacy, were thrown open to the plebs. The patricians lost also the control they had exercised so long over the action of the people in assembly. The patrum auctoritas, the sanction given or refused by the patrician senators to laws and to elections, had hitherto been a powerful weapon in their hands. But in 339 a law of Q. Publilius Philo, a plebeian dictator, enacted that this sanction should be given beforehand to laws enacted in the comitia centuriata, and a lex Menaia of uncertain date extended the rule to elections in the same assembly. Livy ascribes to the same Publilius a law emancipating the concilium plebis from the control of the patres; but this seems in reality to have been effected by the famous lex Hortensia, carried by another plebeian dictator. Henceforward the patrum auctoritas sank into a meaningless form, though as such it still survived in the lifetime of Livy. From 287 onwards it is certain that measures passed by the plebs, voting by their tribes, had the full force of laws without any further conditions whatsoever. The legislative independence of the plebeian assembly was secured, and with this crowning victory ended the long struggle between the orders.

(b) Conquest of Italy.—Twelve years after the passing of the lex Hortensia, King Pyrrhus, beaten at Beneventum, withdrew from Italy, and Rome was left mistress of the peninsula. The steps by which this supremacy had been won have now to be traced. The expulsion of the Tarquins from Rome, followed as it seems to have been by the emancipation from Etruscan supremacy of all the country between the Tiber and the Liris, entirely altered the aspect of affairs. North of the Tiber the powerful Etruscan city of Veii, after a vain attempt to restore the Tarquins, relapsed into an attitude of sullen hostility towards Rome, which, down to the outbreak of the final struggle in 493, found vent in constant and harassing border forays. The Sabines recommended their raids across the Anio; from their hills to the south-east the Aequi pressed forward as far as the hills of the Alban range and ravaged the low country that ranged to the Sabine mountains; the Volsci overran the coast-lands as far as Antium, established themselves at Velitrae and even wasted the fields within a few miles of Rome. But the good fortune of Rome did not leave her to face these foes single-handed, and it is a significant fact that the history of the Roman advance begins, not with a brilliant victory, but with a timely alliance. According to Livy, it was in 493, only a few years after the defeat of the prince of Tuscum at Lake Regillus, that a treaty was concluded between Rome and the Latin communities of the Campagna. The alliance was in every respect natural. The Latins were the near neighbours and kinsmen of the Romans, and both Româns and Latins were just freed from Etruscan rule to find themselves as lowlanders and dwellers in towns face to face with a common foe in the rugged hill tribes on their borders. The exact terms of the treaty cannot, any more than the precise circumstances under which it was concluded, be stated with certainty; but two points seem clear. There was at first a genuine equality in the relations between the allies; Romans and Latins, though combining for defence and offence, did so without sacrificing their separate freedom of action, even in the matter of waging wars independently of each other. But, secondly, Rome enjoyed from the first one inestimable advantage. The Latins lay between her and the most active of her foes, the Aequi and Volsci, and served to protect her territories at the expense of their own. Behind this barrier Rome grew strong, and the close of the Aequian and Volscian wars left the Latins her dependents rather than her allies. Beyond the limits of the Campagna Rome found a second ally, hardly less useful than the Latins, in the tribe of the Hernici ("the men of the rocks"), in the valley of the Trens, who had equal reason with the Romans and Latins to dread the Volsi and Aequi, while their position midway between the two latter peoples made them valuable auxiliaries to the lowlanders of the Campagna.

The treaty with the Hernici is said to have been concluded in 486, and the confederacy of the three peoples—Romans, Latins and Hernicans—lasted down to the great Latin war in 340. Confused and untrustworthy as the chronicles of the early wars of Rome, it is clear that, notwithstanding the acquisition of these allies, Rome made but little way against her foes during the first fifty years of the existence of the Republic. In 474, it is true, an attack on Rome by the lake of Veii was repulsed, and with Veii by a forty years' peace, an advantage due not so much to Roman valour as to the increasing dangers from other quarters which were threatening the Etruscan states. But this partial success stands alone, and down to 440 the raids of Sabines, Aequi and Volsci continue without intermission, and are occasionally carried up to the very walls of Rome.

Very different is the impression left by the annals of the next sixty years (449-390). During this period there is an unmistakable development of Roman power on all sides. In southern Etruria the capture of Veii (396) virtually gave Rome the mastery as far as the Ciminian forest. Sutrium and Nepete, "the gates of Etruria," became her allies and guarded her interests against any attack from the Etruscan communities to the north, while along the Tiber valley her suzerainty was acknowledged as far as Capena and Falerii. On the Anio frontier we hear of no disturbances from 449 until some ten years after the sack of Rome by the Gauls. In 436 the great success of the last time before the gates of Rome. After 418 they disappear from Mount Algidus, and in the same year the communications of Rome and Latium with the Hernici in the Trens valley were secured by the capture and colonization of Labicum. Successive invasions, too, broke the strength of the Volsci, and in 393 a Latin colony was founded as far south as Circeii: In part, no doubt, these Roman successes were due to the improved condition of

decline of Etruscan power.

Affairs in Rome itself, consequently upon the great reforms carried between 450 and 442; but it is equally certain that Rome, as often afterwards, found herself befriended by her foes, by weakening, or by diverting the attention of her opponents. In particular, her rapid advance in southern Etruria was facilitated by the heavy blows inflicted upon the Etruscans during the 5th century B.C. by Celts, Greeks and Samnites. By the close of this century the Celts had expelled from the rich plains of what was afterwards known as Cisalpine Gaul, and were even threatening to advance across the Apennines into Etruria proper. The Sicilian Greeks, headed by the tyrants of Syracuse, wrested from them their mastery of the seas, and finally, on the capture of Capua by the Samnites in 423, they lost their possessions in the fertile Campanian plain. These conquests of the Samnites were part of a great southward movement of the highland Sabellian peoples, the immediate effects of which upon the fortunes of Rome were not confined to the weakening of the Etruscan power. It is probable that the cessation of the Sabine raids across the Anio was partly due to the new outlets which were opened southwards for the restless and populous hill tribes which had so long disturbed the peace of the Latin lowlands. We may conjecture, also, that the growing feebleness exhibited by Volsci and Aequi was in some measure caused by the pressure upon their rear of the Sabellian clans which at this time established themselves near the Fucine lake and along the course of the Liris.

But in 390, only six years after the great victory over her ancient rival Veii, the Roman advance was for a moment checked by a disaster which threatened to alter the course of history in Italy, and which left a lasting impress on the Roman mind. In 391 a Celtic horde left their newly won lands on the Adriatic, and, crossing the Apennines into Etruria, laid siege to the Etruscan city of Clusium (Chiusi). Thence, provoked, it is said, by the conduct of the Roman ambassadors, who, forgetting their sacred character, had fought in the ranks of Clusium and slain a Celtic chief, the barbarians marched upon Rome. On July the 18th of 390 B.C., only a few miles from Rome, was fought the disastrous battle of the Allia. The defeat of the Romans was complete, and Rome lay at the mercy of her foe. But in characteristic fashion the Celts halted three days to enjoy the fruits of victory, and time was thus given to put the Capitol at least in a state of defence. The arrival of the barbarians was followed by the sack of the city, but the Capitol remained impregnable. For seven months they besieged it, and then in as sudden a fashion as they had come they disappeared. The Roman chroniclers explain their retreat in their own way, by the fortunate appearance of M. Furius Camillus with the troops which he had collected, at the very moment when famine had forced the garrison on the Capitol to accept terms. More probably the news that their lands across the Apennines were threatened by the Veneti, coupled with the uncustomed tidium of a long siege and the difficulty of obtaining supplies, inclined the Celts to accept readily a heavy ransom as the price of their withdrawal. But, whatever the reason, it is certain that they retreated, and, though during the next fifty years they ravaged and plundered at intervals in the neighbourhood of Rome, and even once penetrated as far south as Campania (361-60), the Celts never obtained any footing in Italy outside the plains in the north which they had made their own.

Nor, in spite of the defeat on the Allia and the sack of the city, was Rome weakened except for the moment by the Celtic attack. The storm passed away as rapidly as it had come on. The city was hastily rebuilt, and Rome dismayed the enemies who hastened to take advantage of her misfortunes by her undiminished vigour. Her conquests in southern Etruria were successfully defended against repeated attacks from the Etruscans to the north. The creation in 387 of four new tribes (Stellatina, Sabatina, Tromentina, Arrens) marked the final annexation of the territory of Veii and of the lands lying along the Tiber valley.

A few years later Latin colonies were established at Sutrium and Nepete for the more effectual defence of the frontier, and finally, in 353, the subjugation of South Etruria was completed by the submission of Caere (q.v.) and its partial incorporation with the Roman state as a "municipium sine suffragio"—the first, it is said, of its kind. Next to the settlement of southern Etruria, the most important of the successes gained by Rome between 390 and 343 B.C. were those won against her old foes the Aequi and Volsci, and her old allies the Latins and Hernicans. The Aequi indeed, already weakened by their long feud with Rome, and hard pressed by the Sabellian tribes in their rear, were easily dealt with, and after the campaign of 359 we have no further mention of an Aequian war until the last Aequian rising in 304. The Volsci, who in 386 had advanced to Lanuvium, were met and utterly defeated by Camillus, the conqueror of Veii, and this victory was followed up by the gradual subjugation of Rome to all the lowland country lying between the hills and the sea as far south as Tarracina. Latin colonies were established at Satricum (385), at Setia (379), and at Antium and Tarracina some time before 348. In 358 two fresh Roman tribes (Pomptina and Pubbilia) were formed in the same district.

Rome had now nothing more to fear from the foes who a century ago had threatened her very existence. The lowland country, of which she was the natural centre, from the Ciminiun forest to Tarracina, was quiet, and within its limits Rome was by far the strongest power. But she had now to reckon with the old and faithful allies to whose loyal aid her present position was largely due. The Latini and Hernici had suffered severely in the Aequian and Volscian wars; it is probable that not a few of the smaller communities included in the league had either been destroyed or been absorbed by larger states, and the independence of all alike was threatened by the growing power of Rome. The sack of Rome by the Celts gave them an opportunity of reasserting their independence, and we are consequently told that this disaster was immediately followed by the temporary dissolution of the confederacy, and this again a few years later by a series of actual conflicts between Rome and her former allies. Between 383 and 358 we hear of wars with Tibur, Praeneste, Tusculum, Lanuvium, Circeii and the Hernici. But in all Rome was successful. In 382 Tusculum was fully incorporated with the Roman state by the bestowal of the full franchise; in 358, according to both Livy and Polybius, the old alliance was formally renewed with Latini and Hernici. We cannot, however, be wrong in assuming that the position of the allies under the new league was far inferior to that accorded them by the treaty of Spurius Cassius. Henceforth they were the subjects rather than the equals of Rome, a position which it is evident that they accepted much against their will, and from which they were yet to make one last effort to escape.

We have now reached the closing phase of the first stage in Rome's advance towards supremacy in Italy. By 343 B.C. she was already mistress both of the low country stretching from the Ciminiun forest to Tarracina and Circeii and of the bordering highlands. Her own territory had largely increased. Across the Tiber the lands of Veii, Capena and Caere were nearly all Roman, while in Latium she had carried her frontiers to Tusculum on the Alban range and to the southernmost limits of the Pompeian district. And this territory was protected by a circle of dependent allies and colonies reaching northward to Sutrium and Nepete, and southward to Sora on the upper Liris, and to Circeii on the coast. Already, too, she was beginning to be recognized as a power outside the

*"Ade, v. 26.*

limits of the Latin lowlands. The fame of the capture of Rome by the Celts had reached Athens, and her subsequent victories over managing Celtic bands had given her prestige in south
Italy as a bulwark against northern barbarians. In 354 she had formed her first connections beyond the
Liris by a treaty with the Samnites, and in 348 followed a
further more important treaty with the great maritime state of
Carthage.

Rome had won her supremacy from the Cimmerian forest to the
Liris as the champion of the comparatively civilized
communities of the lowlands against the rude highland
tribes which threatened to overrun them, and, so, when
her legions first crossed the Liris, it was in answer to
an appeal from a lowland city against invaders from the
hills. While she was engaged in clearing Latium
of Volsci and Aequi, the Samtalian tribes of the central
Apennines had rapidly spread over the southern half of the peninsula. Foremost among these tribes were the Samnites, a
portion of whom had captured the Etruscan city of Capua in
323, the Greek Cumae in 420, and since then ruled as
masters over the fertile Campanian territory. But
in their rise they soon lost any sense of the
relationship and sympathy with their highland brethren. They
dwelt in cities, amassed wealth, and inherited the civilization of the Greeks and Etruscans whom they had dispossessed;
above all, they had before long to defend themselves in their
turn against the attacks of their ruder kinmen from the hills,
and it was for aid against these that the Samnites of Campania
appealed to the rising state which had already made herself
ewn known as the bulwark of the lowlands north of the Liris, and
which with her Latin and Hernican allies had scarcely less
interest than the Campanian cities themselves in checking the
raids of the highland Samnite tribes.

The Campanian appeal was listened to. Rome with her
confederates entered into alliance with Capua and the neigh-
bouring Campanian towns, and war was formally
declared (343) against the Samnites. While to the
Latin and Hernican was entrusted apparently the
defence of Latium and the Hernican valley against the
northerly members of the Samnite confederacy, the Romans
themselves undertook the task of driving the invaders out of Campania. After two campaigns the war was ended in
341 by a treaty, and the Samnites withdrew from the
lowlands, leaving Rome the recognized suzerain of the
Campanian cities which had sought her aid.

There is no doubt that the check thus given by Rome to the
advance of the hitherto invincible Samalian highlanders not
only made her the natural head and champion of the low
countries, south as well as north of the Liris, but also consider-
ably added to her prestige. Carthage sent her congratulations,
and the Etruscan city of Falerii voluntarily enrolled herself
among the allies of Rome. Of even greater service, however,
was the fact that for fifteen years the Samnites remained quiet,
for this inactivity, whatever its cause, enabled Rome triumph-
antly to surmount a danger which threatened for the
moment to wreck her whole position. This danger was nothing
less than a desperate effort on the part of nearly all her allies and
dependants south of the Tiber to throw off the yoke of her
supremacy. The way was led by her ancient confederates
the Latini, whose smouldering discontent broke into
an open flame directly the fear of a Samnite attack was
removed. From the Latin Campagna and the Sabine hills the
revolt spread westward and southward to Antium and
Tarracina, and even to the towns of the Campamian plain,
where the mass of the inhabitants at once repudiated
the alliance formed with Rome by the ruling class. The struggle
was sharp but short. In two pitched battles the strength
of the insurgents was broken, and two more campaigns sufficed
for the complete reduction of such of the insurgent communities
as still held out. The revolt crushed, Rome set herself de-
liberately to the task of re-establishing on a new and firmer
basis her supremacy over the lowlands, and in doing
so laid the foundations of that marvellous organization
which was destined to spread rapidly over Italy,
and to withstand the attacks even of Hannibal. The old
historic Latin league ceased to exist, though its memory was
still preserved by the yearly Latin festival on the Alban Mount.
Most if not all of the common land of the league became Roman
territory; five at least of the old Latin cities were compelled
to accept the Roman franchise and enter the pale of the Roman
state. The rest, with the Latin colonies, were ranked as Latin
allies of Rome, but on terms which secured their complete
dependence upon the sovereign city. The policy of isolation,
which became so cardinal a principle of Roman rule, was now
first systematically applied. The right of joining or coming
in to exist between these communities
their federal councils were prohibited, and all federal action
independent of Rome forbidden.

In Campania and the coast-lands connecting Campania with
Rome, a policy of annexation was considered safer than that of
alliance. Of the two frontier posts of the Volsci, Antium and Velitrae, the former was constituted a
Roman colony, its long galleys burnt and their
prows set up in the Forum at Rome, while the walls of Velitrae were razed to the ground, its leading men banished
beyond the Tiber, and their lands given to Roman settlers.
Farther south on the route to Campania, Fundi and Formiae
were, after the precedent set in the case of Caere, declared
Roman and granted the civil rights of Roman citizenship, while
lastly in Campania itself the same status was given to Capua,
Cumae, and the smaller communities dependent upon them.
During the ten years from 338 to 328 the work of
settlement was steadily continued. Tarracina, like
Antium, was made a Roman colony. Privernum, the last
Volscian town to offer resistance to Rome, was subdued
in 330, part of its territory allotted to Roman citizens,
and the state itself forced to accept the Roman franchise.
Lastly, to strengthen the lines of defence against the
Samnites, two colonies with the rights of Latin allies were
established at Cales (334) and at Fregellae (328).
The settlement of the lowlands was accomplished. As
a single powerful and compact state with an outer circle of
closely dependent allies, Rome now stood in sharp
contrast with the disunited and degenerate cities of northern Etruria,
the loosely organized tribe of the Apennines, and the
decaying and disorderly Greek towns of the south.

The strength of this system was now to be tried by a struggle
with the one Italian people who were still ready and able to
contest with Rome the supremacy of the peninsula.
The passive attitude of the Samnites between 342 and
327 was no doubt largely due to the dangers which
suddenly threatened them in South Italy. But the death of Alexander of Ephesus in 332 removed
their only formidable opponent there, and left them
free to turn their attention to the necessity of checking the
steady advance of Rome. In 327, the year after the
ominous foundation of a Roman colony at Fregellae,
a pretext for renewing the struggle was offered them. The

Cumaean colony of Palaeopolis 1 had incurred the wrath of Rome by its raids into her territory in Campania. The Samnites sent a force to defend it, and Rome replied by a declaration of war. The two opponents were not at first sight unequally matched, and had the Samnites tribes held firmly together the issue of the struggle might have been different. As it was, however, the Lucanians to the south actually joined Rome from the first, while the northern clans, Marsi, Vestini, Paelligni, Frenatani, after a feeble and lukewarm resistance, subsided into neutrality which was exchanged in 304 for a formal alliance with Rome. An even greater advantage to Rome from the outset was the enmity existing between the Samnites and the Apulians, the latter of whom from the first joined Rome and thus gave her a position in the rear of her enemy and in a country eminently well fitted for maintaining a large military force. These weaknesses on the Samnite side were amply illustrated by the events of the war.

The first seven or eight years were marked by one serious disaster to the Roman arms, the defeat at the Caudine Forks (321), but, when in 318 the Samnites asked for and obtained a two years' truce, Rome had succeeded only in increasing the enemies both of her enemies but in isolating them from outside help. The Lucanians to the south were her allies. To the east, in the rear of Samnium, Apulia acknowledged the suzerainty of Rome, and Luceria, captured in 320, had been established as a base of Roman operations. Finally to the north the Romans had easily overcome the feeble resistance of the Vestini and Frenatani, and secured through their territories a safe passage for their legions to Apulia. On the renewal of hostilities in 316, the Samnites, bent on escaping from the net which was being slowly drawn round them, made a series of desperate efforts to break through the lines of defence which protected Latium and Campania. Sora and Fregellae on the upper Liris were captured by a sudden attack; the Ausones in the low country near the mouth of the same river were encouraged to revolt by the appearance of the Samnite army; and in Campania another army, attracted by rumours of disturbance, all but defeated the Roman consuls under the very walls of Capua. But these efforts were unavailing. Sora and Fregellae were reoccupied; and on the frontier there was strengthened by the establishment of a colony at Interamna. The Ausones were punished by the confiscation of their territory, and Roman supremacy further secured by the two colonies of Sussea and Pontia (312). The construction of the famous Via Appia, 2 the work of the censor Appius Claudius Caecus, opened a safe and direct route to Campania, while the capture of Nola deprived the Samnites of their last important stronghold in the Campanian lowlands. The failure of these attempts broke the courage even of the Samnites. Their hopes were indeed raised for a moment by the news that Etruria had risen against Rome (310), but their daring scheme of effecting a union with the Etruscans was frustrated by the energy of the Roman generals. Five years later (305) the Romans revenged a Samnite raid into Campania by an invasion of Samnium itself. Arpinum on the frontier was taken, and at last, after a twenty-two years' struggle, the Second Samnite War was closed by a renewal of the ancient treaty with Rome (304). 3

The six years of peace which followed (304-298) were employed by Rome in still further strengthening her position.

Already, two years before the peace, a rash revolt of the Hernici 4 had given Rome a pretext for finally annexing the territory of her ancient allies. The tribal confederacy was broken up, and all the Hernican communities, with the exception of three which had not joined the revolt, were incorporated with the Roman state as municipia, with the civil rights of the Roman franchise. Between the Hernican

1 Livy viii. 22. 2 Livy viii. 23. 3 Ibid. ix. 45. 4 Ibid. ix. 43.
of Umbria rendered them as valuable to Rome as the Apulians who had proved farther south.

Fourteen years had passed since the battle on the Vadimonian Lake, when the Samnites appeared on the borders of Etruria and called on the peoples of northern Italy to rise against the common enemy. Their appeal, backed by the presence of their troops, was successful. The Etruscans found courage to face the Roman legions once more; a few of the Umbrians joined them; but the most valuable allies to the Samnites were the Celts, who had for some time threatened a raid across the Appennines, and who now marched eagerly into Umbria and joined the coalition. The news that the Celts were in motion produced a startling effect at Rome, and every nerve was strained to meet this new danger. While two armies were left in southern Etruria as reserves, the two consuls, Q. Fabius Maximus Rullianus and P. Decius Mus the younger, both tried soldiers, marched northwards up the valley of the Tiber and planted colonies on the borders of their Roman legions and a still larger force of Italian allies. At Sentinum, on the further side of the Appennines, they encountered the united forces of the Celts and Samnites, the Etruscans and Umbrians having, it is said, been withdrawn for the defence of their own homes. The battle that followed was desperate, and the Romans lost one of their consuls, Decius, and more than 8000 men. But the Roman victory was decisive. The Celts were annihilated, and the fear of a second Celtic attack on Rome removed. All danger from the coalition was over. The Etruscan communities gladly purchased peace by the payment of indemnities. The rising in Umbria, never formidable, died away, and the Samnites were left single-handed to bear the whole weight of the wrath of Rome. During four years more, however, they desperately defended their highland homes, and twice at least, in 293 and 292, they managed to place in the field a force sufficient to menace the Roman legions on equal terms. At last, in 290, the consul M. Curius Dentatus finally exhausted their power of resistance. Peace was concluded, and it is significant of the respect inspired at Rome by their indomitable courage that they were allowed to become the allies of Rome, on equal terms and without any sacrifice of independence. Between the close of the Third Samnite War and the landing of Pyrrhus in 281 B.C., we find Rome engaged, as her wont was, in quietly extending and consolidating her power. In southern Italy she strengthened her hold on Apulia by planting on the borders of Apulia and Lucania the strong colony of Venusia. In central Italy the annexation of the Sabine country (290) carried her frontiers eastward to the borders of her Picentine allies on the Adriatic. Further east, in the territory of the Picentes themselves, she established an Adriatic coast at Hadria and Castrum (285-83). North of the Picentes lay the territoria of the Celtic Senones stretching inland to the north-east borders of Etruria, and these too now fell into her hands. Ten years after their defeat at Sentinum (285-84) a Celtic force descended into Etruria, besieged Arretium and defeated the relieving force despatched by Rome. In 283 the consul L. Cornelius Dolabella was sent to avenge the insult. He completely routed the Senones. Their lands were annexed by Rome, and a colony established at Sena on the coast. This success, followed as it was by the decisive defeat of the neighbouring tribe of the Boii, who had invaded Etruria and penetrated as far south as the Vadimonian Lake, awed the Celts into quiet, and for more than forty years there was comparative tranquillity in northern Italy.

In the south, however, the claims of Rome to supremacy

were now to be disputed by a new and formidable foe. At the close of the Third Samnite War the Greek cities on the southern coast of Italy found themselves once more harassed by the Sabellian tribes on their borders, whose energies, no longer absorbed by the long struggles in central Italy, now found an attractive opening southward. Naturally enough the Greeks, like the Capuans sixty years before, appealed for aid to Rome (283-82), and like the Capuans they offered in return to recognize the suzerainty of the great Latin Republic. In reply a Roman force under C. Fabricius Luscinus marched into south Italy, easily routed the marauding bands of Lucanians, Bruttians and Samnites, and established Roman garrisons in Locri, Croton, Rhegium and Thurii. At Tarentum, the most powerful and florishing of the Greek seaports, this sudden and rapid advance of Rome excited the greatest anxiety. Tarentum was already allied by treaty (301) with Rome, and she had now to decide whether this treaty should be exchanged for one which would place her, like the other Greek communities, under the protectorate of Rome, or whether she should find some ally able and willing to assist in making a last stand for independence. The former course, in Tarentum, as before at Capua, was the one favoured by the aristocratic party; the latter was eagerly supported by the mass of the people and their leaders. While matters were still in suspense, the appearance, contrary to the treaty, of a Roman squadron off the harbour decided the controversy. The Tarentines, indignant at the insult, attacked the hostile fleet, killed the admiral and sunk most of the ships. Still Rome, relying probably on her partisans in the city, tried negotiation, and an alliance appeared likely after all, when suddenly the help for which the Tarentine democrats had been looking appeared, and war with Rome was resolved upon (281-80). King Pyrrhus, with a timely appearance seemed for the moment to have saved the independence of Tarentum, was the most brilliant of the military adventurers whom the disturbed times following the death of Alexander the Great had brought into prominence. High-spirited, generous and ambitious, he had formed the scheme of rivaling Alexander's achievements in the East, by winning for himself an empire in the West. He aspired not only to unite under his rule the Greek communities of Italy and Sicily, but to overthrow the great Phoenician state of Carthage—the natural enemy of Greeks in the West, as Persia had been in the East. Of Rome it is clear that he knew little or nothing; the task of guiding the Greek seaports of their barbarian foes he no doubt regarded as an easy one; and the splendid force he brought with him was intended rather for the conquest of the West than for the preliminary work of chastising a few Italian tribes, or securing the submission of the unwarlike Italian Greeks. He defeated the Roman consul, M. Valerius Laevinus, on the banks of the Liris (280), and gained the support of the Greek cities as well as that of numerous bands of Samnites, Lucanians and Bruttians. But, to the disappointment of his new allies, Pyrrhus showed no anxiety to follow up his advantage. His heart was set on Sicily and Africa, and his immediate object was to come to terms with Rome. But though he advanced as near Rome as Anagnia (279), nothing could shake the resolution of the senate, and in the next year (278) he again routed the legions at Asculum (Ascoli), but only to find that the indomitable resolution of the enemy was strengthened by defeat. He now crossed into Sicily, where, though at first successful, he was unable to achieve any lasting result. Soured and disappointed, Pyrrhus returned to Italy (276) to find the Roman legions steadily moving southwards, and his Italian allies disgusted by his desertion of their cause. In what the decisive battle of the war was fought at Beneventum. The consul, M. Curius Dentatus, the conqueror of Samnia, gained a complete victory.

1 Livy, Epit. xii.; Plut. Pyrrh. 13.
2 For his career and the story of his wars with Rome, see the article PYRRHUS.
and Pyrrhus, unable any longer to face his opponents in the field, and disappointed of all assistance from his allies, retreated to disgust to Tarentum and threw himself into Greece. A few years later (272) Tarentum was surrendered to Rome by its Epirot garrison; it was granted a treaty of alliance, but its walls were razed and its fleet handed over to Rome. In 270 Rhegium also entered the ranks of Roman allies, and finally in 269 a single campaign crushed the last efforts at resistance in Samnium. Rome was now at leisure to consolidate the position she had won. Between 273 and 263 three new colonies were founded in Samnium and Lucania—Paestum in 273, Beneventum in 268, Asseeria in 263. In central Italy the area of Roman territory was increased by the full enfranchisement (268) of the Sabines, and of their neighbours to the east, the people of Picenum.

To guard the Adriatic coast colonies were established at Ariminum (268), at Firmum and at Castrum Novum (264), while to the already numerous maritime colonies was added that of Cosa in Etruria.óm

Rome was now the undisputed mistress of Italy. The limits of her supremacy to the north were represented roughly by a line drawn across the peninsula from the mouth of the Arno on the west to that of the Aesis on the east. Beyond this line lay the Ligurians and the Celts; all south of it was now united as "Italy" under the rule of Rome. But the rule of Rome over Italy, like her wider rule over the Mediterranean coasts, was not an absolute dominion over conquered peoples. It was in form at least a confederacy under Roman protection and guidance; and the Italians, like the provincials, were not the subjects, but the "allies and friends" of the Roman people. In the treatment of these allies Rome consistently followed the maxim, divite et impera. In every possible way she strove to isolate them from each other, while binding them closely to herself. The old federal groups were in most cases broken up, and each of the members united with Rome by a special treaty of alliance. In Etruria, Latium, Campania and Magna Graecia the city state was taken as the unit; in central Italy where urban life was non-existent, the unit was the tribe. The northern Sabellian peoples, for instance—the Marsi, Paeni and Vestini, Murrucini, Frentani—were now constituted as separate communities in alliance with Rome. In many cases, too, no freedom of trade or intermarriage was allowed between the allies themselves, a policy afterwards systematically pursued in the provinces. Nor were all these numerous allied communities placed on the same footing as regarded their relations with Rome. To begin with, a sharp distinction was drawn between the "Latin" and the general mass of Italian allies.

The Roman...
state were now included numerous communities with local institutions and government. At their head stood the Roman colonies (coloniae civium Romanorum), founded to guard especially the coasts of Latium and Campania. 1 Next to these eldest children of Rome came those communities which had been invested with the full Roman franchise, such, for instance, as the old Latin towns of Aricia, Lanuvium, Tusculum, Nomentum and Pedum. Lowest in the scale were those which had not been considered ripe for the full franchise, but had, like Caere, received instead the civilitas sine suffragio, the civil without the political rights. 2 Their members, though Roman citizens, were not enrolled in the tribes, and in time of war served not in the ranks of the Roman legions but in separate contingents. In addition to these organized town communities, there were also the groups of Roman settlers on the public lands, and the dwellers in the village communities of the enfranchised highland districts in central Italy.

The administrative needs of this enlarged Rome were obviously such as could not be adequately satisfied by the system which had done well enough for a small city state with a few square miles of territory. The old centralization of all government in Rome itself had become an impossibility, and the Roman statesmen did their best to meet the altered requirements of the time. The urban communities within the Roman pale, colonies and municipia, were allowed a large measure of local self-government. In all we find local assemblies, senates and magistrates, to whose hands the ordinary routine of local administration was confided, and, in spite of differences in detail, e.g. in the titles and numbers of the magistrates, the same type of constitution prevailed throughout. 3 But these local authorities were carefully subordinated to the higher powers in Rome. The local constitution could be modified or revoked by the Roman senate and assembly, and the local magistrates, no less than the ordinary members of the community, were subject to the paramount authority of the Roman consuls, praetors and censors. In particular, care was taken to keep the administration of justice well under central control. The Roman citizen in a colony or municipium enjoyed, of course, the right of appeal to the Roman people in a capital case. We may also assume that from the first some limit was placed to the jurisdiction of the local magistrate, and that cases falling outside it came before the central authorities. But an additional safeguard for the equitable and uniform administration of Roman law, in communities to many of which the Roman code was new, was provided by the promotion of prefects (proejecti iuris dicundo), 4 who were sent out annually, as representatives of the Roman praetor, to administer justice in the colonies and municipia. To prefects was, moreover, assigned the charge of those districts within the Roman pale where no urban communities, and consequently no organized local government, existed. In these two institutions, that of municipal government and that of prefectures, we have already two of the cardinal points of the later imperial system of government.

Lastly, the changes which the altered position and increased responsibilities of Rome had effected in her military system tended to weaken the intimate connexion between the Roman army in the field and the Roman people at home, and thus prepared the way for that complete breach between the two which in the end proved fatal to the Republic. It is true that service in the legion was still the first duty and the highest privilege of the fully qualified citizen. But this service was gradually altering in character. Though new legions were still raised each year for the summer campaigns, this was by no means always accompanied, as formerly, by the disembarkation of those already on foot, and this increase in the length of time during which the citizen was kept with the standards had, as early as the siege of Veii, necessitated a further deviation from the old theory of military service—the introduction of pay. 6 Moreover, while in the early days of the Republic the same divisions served for the soldier in the legion and the citizen in the assembly, in the new manipular system, 7 with its three lines, no regard was paid to civic distinctions, but only to length of service and military efficiency, while at the same time the more open order of fighting which it involved demanded of each soldier greater skill, and therefore a more thorough training in arms than the old phalanx. One other change resulted from the new military necessities of the time, which was as fruitful of results as the incipient separation between the citizen and the soldier. Under the early Republic, the chief command of the legions rested with the consuls of the year. But, as Rome's military operations increased in area and in distance from Rome, a larger staff became necessary, and the inconvenience of summoning home a consul in the field from an unfinished campaign became intolerable. The remedy found, that of prolonging for a further period the imperium of the consul, was first applied in 327 B.C. in the case of Q. Publius Philo, 8 and between 327 and 326 instances of this prorogatio imperi became increasingly common. This proconsular authority, originally an occasional and subordinate one, was destined to become first of all the strongest force in the Republic, and ultimately the chief prop of the power of the Caesars.

Period B: Rome and the Mediterranean States, 265–146 B.C.—(a) Conquest of the West.—Though marked out by her geographical position as the natural centre of the Mediterranean, Italy had hitherto played no active part in Mediterranean politics, but, now that she was for the first time united, it was felt throughout the Mediterranean world that a new power had arisen, and Rome, as the head and representative of Italy, found herself irresistibly drawn into the vortex of Mediterranean affairs. Egypt sought her alliance, and Greek scholars began to interest themselves keenly in the history, constitution, and character of the Latin Republic which had so suddenly become famous. But Rome looked naturally westward rather than eastward. The western coasts of the peninsula were the most fertile and populous and wealthy; and it was in this direction that the natural openings for Italian commerce were to be found. It was, however, precisely the desire that Rome had serious ground for anxiety. Carthage was now at the height of her power. Her outposts were threateningly near to Italy in Sardinia and in Sicily, while her fleets swept the seas and jealously guarded for the benefit of Carthage alone the hidden treasures of the West. In the east of Sicily, Syracuse still upheld the cause of Greek independence against the hereditary foe of the Greek race; but Syracuse stood alone, and her resources were comparatively small. What Rome had to fear was the establishment, and that at no distant date, of an absolute Carthaginian domination over the Western seas—a domination which would not only be fatal to Italian commerce, but would be a standing menace to the safety of the Italian coasts.

It was above all things essential for Rome that the Carthaginians should advance no farther eastward. But already in 272 Tarentum had almost fallen into their grasp, and seven years later Rome was threatened with the establishment of Carthaginian rule at Messana, within sight of the Italian coast. The intervention of both powers in a quarrel between the Mamertines, a body of Campanian mercenaries who had occupied Messana, and Hiero II. of Syracuse, First Punic War, 264–4–499–513.

1 Ostia, Antium, Tarracina, Minturnae, Sinuessa, and, on the Adriatic, Sena and Castrum Novum.
2 To both these classes the term municipia was applied.
3 See Beloch, Ital. Bund, cap. vii. 33. The enfranchised communities in most cases retained the old titles for their magistrates, and hence the variety in their designations.
4 For the prefects, see Mommsen, Hist. of Rome, ii. 49, 67, and Instaurat. ii. 608: Beloch, 130–33.
5 Mommsen, Hist. of Rome, ii. 72 seq.; Livy viii. 8; Polyb. vii. 17–42.
of Syracuse, led to the outbreak of war between Rome and Carthage in 264 B.C. The military history of the struggle which followed is treated in the article Punic Wars; it will suffice to note here that the war lasted until 241 B.C., when the Carthaginians were compelled to cede Sicily and the Lipari islands to Rome, and to pay an indemnity of 3200 talents (about £800,000).

The struggle was one in which both Rome and Carthage were serving an apprenticeship in a warfare the conditions of which were unfamiliar to both. The Roman legions were foes very unlike any against which the Carthaginian leaders had ever led their motley array of mercenaries, while Rome was called upon for the first time to fight a war across the sea, and to fight with ships against the greatest naval power of the age. The novelty of these conditions accounts for much of the vacillating and uncertain action observable on both sides. It is possible that Hamilcar had already made up his mind that Rome must be attacked and crushed in Italy, but his government attempted nothing more than raids upon the coast. There are indications also that some in the Roman senate saw no end to the struggle but in the destruction of Carthage; yet as an invasion of Africa was only once seriously attempted, and then only a half-hearted support was given to the expedition. But these peculiarities in the war served to bring out in the clearest relief the strength and the weakness of the two contending states. The chief dangers for Carthage lay obviously in the jealousy exhibited at home of her officers abroad, in the difficulty of controlling her mercenary troops, and in the ever-present possibility of disaffection among her subjects in Libya—dangers which even the genius of Hannibal failed finally to surmount. Rome, on the other hand, was strong in the public spirit of her citizens, the fidelity of her allies, the valour and discipline of her legions. What she needed was a system which should make a better use of her splendid materials than one under which her plans were shaped from day to day by a divided senate, and executed by officers who were changed every year, and by soldiers most of whom returned home at the close of each summer’s campaign.

The interval between the First and Second Punic Wars was employed by both Rome and Carthage in strengthening their respective positions. The eastern end of Sicily was still left under the rule of Hiero as the ally of Rome, but the larger western portion of the island became directly subject to Rome, and a temporary arrangement seems to have been made for its government, either by one of the two praetors, or possibly by a quaestor. Sardinia and Corsica had not been surrendered to Rome by the treaty of 241, but three years later (239), on the invitation of the Carthaginian mercenaries stationed in the islands, a Roman force occupied them; Carthage protested, but, on the Romans threatening war, she gave way, and Sardinia and Corsica were formally ceded to Rome, though it was some seven or eight years before all resistance on the part of the natives themselves was crushed.

In 227, however, the senate considered matters ripe for the establishment of a separate administration in her overseas possessions. In that year two additional praetors were elected; to one was assigned the charge of western Sicily, to the other that of Sardinia and Corsica, and thus the first stones of the Roman provincial system were laid. Of at least equal importance for the security of the peninsula was the subjugation of the Celtic tribes in the valley of the Po. These, headed by the Boi and Insubres and assisted by levies from the Celts to the westward, had in 223 alarmed the whole of Italy by invading Etruria and penetrating to Clusium, only three days’ journey from Rome. Here, however, their courage seems to have failed them. They retreated northward along the Etruscan coast, until at Telamon their way was barred by the Roman legions, returning from Sardinia to the defence of Rome, while a second consular army hung upon their rear. Thus hemmed in, the Celts fought desperately, but were completely defeated and the flower of their tribesmen slain. The Romans followed up their success by invading the Celtic territory. The Boi were easily reduced to submission. The Insubres, north of the Po, resisted more obstinately, but by 222 the war was over, and all the tribes in the rich Po valley acknowledged the supremacy of Rome. The conquered Celts were not enrolled among the Italian allies of Rome, but were treated as subjects beyond the frontier. Three colonies were founded to hold them in check—Placentia (218) and Cremona in the territory of the Insubres, Mutina (183) in that of the Boi; and the great northern road (Via Flaminia) was completed as far as the Celtic border at Ariminum.

On the Adriatic coast the immediate interests of Rome were limited to rendering the sea safe for Italian trade. It was with this object that, in 229, the first Roman expedition crossed the Adriatic, and inflicted severe chastisement on the Illyrian pirates of the opposite coast. This expedition was the means of establishing for the first time direct political relations between Rome and the states of Greece proper, to many of which the suppression of piracy in the Adriatic was of more immediate importance than to Rome itself, the conquests were concluded with Corcyra, Epidamnus, and Apollonia; and embassies explaining the reasons which had brought Roman troops into Greece were sent to the Aetolians, the Achaean, and even to Athens and Corinthis. Everywhere they were well received, and the admission of the Romans to the Isthmian games (228) formally acknowledged them as the natural allies of the free Greek states against both barbarian tribes and foreign despots. Meanwhile Carthage had acquired a possession which promised to compensate her for the loss of Sicily, Sardinia and Corsica. The genius of her greatest citizen and soldier, Hannibal Barca, had appreciated the enormous value of the Spanish peninsula, and conceived the scheme of founding there a Carthaginian dominion which should not only add to the wealth of Carthage, but supply with a base of operations for a war of revenge with Rome. The conquest of southern and eastern Spain, begun by Hamilcar (236–230) and carried on by his kinsman Hasdrubal (228–211), was completed by his son Hannibal, who, with all his father’s genius, inherited also his father’s hatred of Rome, and by 219 the authority of Carthage had been extended as far as the Ebro (see SPAIN, History). Rome had not watched this rapid advance without anxiety, but, probably owing to her troubles with the Celts, she had contented herself with stipulating (220) that Carthage should not carry her arms beyond the Ebro, so as to threaten Rome’s ancient ally, the Greek Massilia (mod. Marseilles), and with securing the independence of the two nominally Greek communities, Emporiae and Saguntum, on the east coast.

But these precautions were of no avail against the resolute determination of Hannibal, with whom the conquest of Spain was only preliminary to an attack upon Italy, and who could not afford to leave behind him in Spain a state allied to Rome. In 219, therefore, disregarding the protests of a Roman embassy, he attacked and took Saguntum, an act which, as he had foreseen, rendered a rupture with Rome inevitable, while it set his own hands free for a further advance. For the details of the war which followed, the reader may be referred to the articles Punic Wars, Hannibal, and SCIPIO. From the outbreak of hostilities until the crowning victory of Cannae in 216 Hannibal’s career of success was unchecked; and the annihilation of the Roman army in that battle was followed by the defection of almost the whole of southern Italy, with the exception of the Latin colonies and the Greek coast towns. In 215, moreover, Philip V of Macedon formed an alliance with Hannibal and threatened to invade Italy; in 214 Syracuse revolted, and in 212 the Greek cities in S. Italy went over to Hannibal. But the indomitable spirit

3 Polyb. iii. 15, 37.
of the Romans asserted itself in the face of these crushing misfortunes. In 212 Syracuse was recovered; in 211 Carthage fell after a long siege which Hannibal failed to raise, even by his famous march up to the gates of Rome, and in the same year a coalition was formed in Greece against Philip V. of Macedon, which effectually paralysed his offensive action. Hannibal was now confined to Lucania and Bruttium; and his brother Hasdrubal, marching from Spain to join him, was defeated and slain on the river Metaurus (207). The war in Italy was now virtually ended, for, though during four years more Hannibal stood at bay in a corner of Bruttium, he was powerless to prevent the restoration of Roman authority throughout the peninsula. Sicily was once more secure; and finally in 206, the year after the victory on the Metaurus, the successes of the young P. Scipio in Spain (211–6) were crowned by the complete expulsion of the Carthaginians, from the peninsula. On his return from Spain Scipio eagerly urged an immediate invasion of Africa. The senate hesitated; but Scipio gained the day. He was elected consul for 205, and given the province of Sicily, with permission to cross into Africa if he thought fit. Voluntary contributions of men, money, and supplies could always be expected from the popular hero; and by the end of 205 Scipio had collected such an army and force for his purpose. In 204 he crossed to Africa, where he was welcomed by the Numidian prince Massinissa, whose friendship he had made in Spain. In 203 he twice defeated the Carthaginian forces, and a large party at Carthage were anxious to accept his offer of negotiations. But the advocates of resistance triumphed. Hannibal was recalled from Italy, and returned to fight his last battle against Rome at Zama, where Scipio, who had been continued in command as proconsul for 202 by a special vote of the people, won a complete victory. The war was over. The Roman assembly voted that the Carthaginian request for peace should be granted, and entrusted the settlement of the terms to Scipio and a commission of ten senators. Carthage was allowed to retain her territory in Africa; but she undertook to wage no wars outside Africa, and none inside without the consent of Rome. She surrendered all her ships and ten triremes, her elephants, and all prisoners of war; she agreed to pay an indemnity of 10,000 talents in fifty years. The Numidians, Massinissa (q.v.) was rewarded by an increase of territory, and was enrolled among the "allies and friends" of the Roman people. The battle of Zama decided the fate of the West. The power of Carthage was broken and her supremacy passed to Rome. Henceforth Rome had no rival to fear westward of Italy, and it rested with herself to settle within what limits her supremacy should be extended and what form it should take. For the next fifty years, however, Rome was too deeply involved in the affairs of the East to think of extending her rule far beyond the limits of the rich inheritance which had fallen to her by the defeat of Carthage; but within this area considerable advance was made in the organization and consolidation of her rule. In Sicily and Spain, the immediate establishment of a Roman government was imperatively necessary, if these possessions were not either to fall to internal anarchy or to be recovered by some second Hamilcar. Accordingly, we find that in Sicily the former dominions of Hiero were at once united with the western half of the island as a single province, and that in Spain, after nine years of a provisional government (206–9), two provinces were in 197 definitely established, and each, like Sicily, assigned to one of the praetors for the year, two additional praetors being elected for the purpose. But here the resemblance between the two cases ends. From 201 down to the outbreak of the Slave War in 136 there was unbroken peace in Sicily, and its part in the history is limited to its important functions in supplying Rome with corn and in provisioning and clothing the Roman legions. It became every year a more integral part of Italy; and a large proportion even of the land itself passed gradually into the hands of enterprising Roman speculators. The governors of the two Spain had very different work to do from that which fell to the lot of the Sicilian praetors. The condition of Spain required that year after year the praetors should be armed with the consular authority, and backed by a standing force of four legions, while more than once the presence of the consuls themselves was found necessary. Still, in spite of all difficulties, the work of pacification proceeded. To M. Porcius Cato, the censor, and to Tiberius Sempronius Gracchus (praetor and praetor, 180–79), father of the two tribunes, is mainly due the credit of quieting the Celtiberian tribes of central Spain, and the government of Gracchus was followed by thirty years of comparative tranquillity. The insurrection headed by Viriathus in 149 was largely caused by exactions of the Roman magistrates themselves, while its ultimate subjugation was due to the influence of Numancia, in 133, was almost as much the result of the incapacity of the Roman commanders. But the re-settlement of the country by Scipio Africanus the younger in that year left all Spain, with the exception of the highland Astures and Cantabri in the north-west, finally and tranquilly subject to Rome. Roman traders and speculators flocked to the seaport towns and spread inland. The mines became centres of Roman industry; the Roman legions quartered in Spain year after year married Spanish wives, and when their service was over gladly settled down in Spain in preference to returning to Italy. The first Roman communities established outside Italy were both planted in Spain, and both owed their existence to the Roman legions.

In Africa there was no question at first of the introduction of Roman government by the formation of a province (see AFRICA, ROMAN). Carthage, bound hand and foot by the treaty of 201, was placed under the jealous watch of the loyal prince of Numidia, who himself willingly trusted the safety of Rome. But it was impossible for this arrangement to be permanent. Every symptom of reviving prosperity at Carthage was regarded at Rome with feverish anxiety, and neither the expulsion of Hannibal in 195 nor his death in 183 did much to check the growing conviction that Rome would never be secure while her rival existed. It was therefore with grim satisfaction that many in the Roman senate watched the increasing irritation of the Carthaginians under the harassing raids and encroachments of their favoured neighbour Massinissa, and waited for the moment when Carthage should, by some breach of the conditions imposed upon her, supply Rome with a pretext for interference. At last in 151 the news that Carthage, in defiance of treaty obligations, was actually at war with Massinissa. The anti-Carthagian party in the senate, headed by M. Porcius Cato, eagerly seized the opportunity, and war was declared, and nothing short of the destruction of the city itself was demanded from the despairs Carthaginians. The demand was refused, and in 149 the siege of Carthage begun. During the next two years of steady but little progress was made, but in 147 P. Cornelius Scipio Africanus, grandson by adoption of the conqueror of Hannibal, was, at the age of thirty-seven, and though

3 Some fresh light has been thrown upon the later campaigns in Spain by the recently discovered fragment of an epitome of Livy (Oxyrhynchos Papyri, iv. 688; Kornemann, Die neue Liviusfragment aus Oxyrhynchos (1904).
4 Italia (206), Appian, Iber. 38; Carteia (171), Livy xlviii. 3.
only a candidate for the sedile, elected consul, and given the command in Africa. In the next year (146) Carthage was taken and razed to the ground. Its territory became the Roman province of Africa, while Numidia, now ruled by the three sons of Massinissa, remained as an allied state under Roman suzerainty, and served to protect the new province against the raids of the desert tribes (see CARTHAGE).

In Italy itself the Hannibalic war had been followed by important changes. In the north the Celtic tribes paid for their sympathy with Hannibal by the final loss of all separate political existence. Cispadian Gaul, studded with colonies and flooded with Roman settlers, was rapidly Romanized. Beyond the Padus (Po) in Polybius's time Roman civilization was already widely spread. In the extreme north-east the Latin colony of Aquileia, the last of its kind, was founded in 181, to control the Alpine tribes, while in the north-west the Ligurians were held in check by the colony of Luna (180), and by the extensive settlements of Roman citizens and Latins made on Ligurian territory in 173.\(^1\) In southern Italy the depression of the Greek cities on the coast, begun by the raids of the Sabellian tribes, was completed by the repeated blows inflicted upon them during the Hannibalic struggle. Some of them lost territory;\(^2\) all suffered from a decline of population and loss of trade; and their place was taken by such new Roman settlements as Brundusium (Brindisi) and Fucini (Pozzuoli).\(^3\) In the interior the southern Sabellian tribes suffered scarcely less severely. The Bruttii were struck off the list of Roman allies, and nearly all their territory was confiscated.\(^4\) To the Apulians and Lucanians no such hard measure was meted out; but their strength had been broken by the war, and their numbers dwindled; large tracts of land in their territories were seized by Rome, and allotted to Roman settlers, or occupied by Roman speculators. That Etruria also suffered from declining energy, a dwindling population, and the spread of large estates is clear from the state of things existing there in 133. It was indeed in central Italy, the home of the Latins and their nearest kinsmen, and in the new Latin and Roman settlements throughout the peninsula that progress and activity were henceforth concentrated.

\[\text{Rome in the East, 200–133.} - \text{Ever since the repulse of Pyrrhus from Italy, Rome had been slowly drifting into closer contact with the Eastern states. With one of the three great powers which had divided between them the empire of Alexander, with Egypt, she had formed an alliance in 273, and the alliance had been cemented by the growth of commercial intercourse between the two countries.} \]

\[\text{228 her chastisement of the Illyrian pirates had led naturally enough to the establishment of friendly relations with some of the states of Greece, properly, with the alliance between Philip V of Macedon and Hannibal, and the former's threatened attack on Italy, forced her into war with Macedon, at the head of a coalition of the Greek states against him, which effectively frustrated his designs against herself; at the first opportunity, however (205), she ended the war by a peace which left the position unchanged. The results of the war were not only to draw closer the ties which bound Rome to the Greek states, but to inspire the senate with a genuine dread of Philip's restless ambition, and with a bitter resentment against him for his union with Hannibal. The} \]

\[\text{events of the next four years served to deepen both these feelings. In 205 Philip entered into a compact with Antiochus III of Syria for the partition between them of the dominions of Egypt, now left by the death of Ptolemy Philopator to the rule of a boy-king. Antiochus was to take Coele-Syria and Phoenicia, while Philip claimed for his share the districts subject to Egypt on the coasts of the Aegean and the Greek islands. Philip no doubt hoped to be able to secure these unlawful acquisitions before the close of the Second Punic War should set Rome free to interfere with his plans. But the obstinate resistance offered by Attalus of Pergamum and the Rhodians upset his calculations. In 201 Rome made peace with Carthage, and the senate had leisure to listen to the urgent appeal for assistance which reached her from her Eastern allies. With Antiochus indeed the senate was not yet prepared to quarrel; but with Philip the senate had no thoughts of a peaceful settlement. Their animosity against him has been deepened by the assistance he had recently rendered to Carthage. Always an unsafe and turbulent neighbour, he would, if allowed to become supreme in the Aegean, prove as dangerous to her interests in the East as Carthage had been in the West. To cripple or at least to stay the growth of Philip's power was in the eyes of the senate a necessity; but it was only by representing a Macedonian invasion of Italy as imminent that they persuaded the assembly, which was longing for peace, to pass a declaration of war (200).} \]

The war began in the summer of 200 B.C., and, though the landing of the Roman legions in Epirus was not followed, as had been hoped, by any general rising against Philip, yet the latter had soon to discover that, if they were not enthusiastic for Rome, they were still less inclined actively to assist him. Neither by force nor by diplomacy could he make any progress south of Bocotia. The fleets of Pergamum and Rhodes, now the zealous allies of Rome, protected Attica and watched the eastern coasts. The Achaeans and Nabis of Sparta were obstinately neutral, while nearer home in the north the Epirots and AEtolians threatened Thessaly and Macedonia. His own resources both in men and in money had been severely strained by his constant wars, and the only ally who could have given him effective assistance, Antiochus, was fully occupied with the conquest of Coele-Syria. It is no wonder then that, in spite of his dashing generalship and high courage, he made but a brief stand. T. Quinctius Flamininus (consul 198), in his first year of command, defeated him on the Aous, drove him back to the pass of Tempe, and in the next year utterly routed him at Cynoscephalae. Almost at the same moment the Achaeans, who had now joined Rome, took Corinth, and the Rhodians defeated his troops in Caria. Further resistance was impossible; Philip submitted, and early the next year a Roman commission reached Greece with instructions to arrange terms of peace. These were such as effectually removed Philip as an object in Rome's mind as a danger to herself and her allies from Macedonian aggression. Philip was left in possession of his kingdom, but was degraded to the rank of a second-rate power, deprived of all possessions in Greece, Thrace and Asia Minor, and forbidden, as Carthage had been in 201, to wage war without the consent of Rome, whose ally and friend he now became.

The second point in the settlement now effected by Rome was the liberation of the Greeks. The "freedom of Greece" was proclaimed at the Isthmian games amid a scene of wild enthusiasm,\(^11\) which reached its height when two years later (194) Flamininus withdrew his troops even from the "three letters of Greece"—Chalcis, Demetrias and Corinth.\(^12\) There is no reason to doubt that, in acting thus, not only Flamininus himself, but the senate and people at home were influenced, partly at any rate, by feelings of genuine

sympathy with the Greeks and reverence for their past. It is
equally clear that no other course was open to them. For
Rome to have resumed Greek control in Asia Minor, and
wrested theTroilus, to which the
Greek states, as allies of Rome, were expected to refrain from war upon each
other without her consent.1

Antiochus III. of Syria, Philip's accomplice in the proposed
partition of the dominions of their common rival, Egypt,
returned from the conquest of Coele-Syria (198) to learn
first of all that Philip was hard pressed by the Romans,
shortly afterwards that he had been decisively beaten at Cynocephalae. It was already too late to
assist him any longer, but Antiochus resolved at any rate
to lose no time in securing for himself the possessions of the
Ptolemies in Asia Minor and in eastern Thrace, which Philip
had claimed, and which Rome now pronounced free and inde-
pendent. In 197-96 he overran Asia Minor and crossed
into Thrace.2 But Antiochus was pleasure-loving, ir-
resolute, and no general, and it was not until 192
that the urgent entreaties of the Aetolians, and the withdrawal
of the Roman troops from Greece, nerved him to the decisive
step of crossing the Aegean; even then the force he took with
him was so small as to show that he completely failed to appre-
ciate the nature of the task before him.3 At Rome the prospect
of a conflict with Antiochus excited great anxiety, and it was
not until every resource of diplomacy had been exhausted that
war was declared,4 and the real weakness which lay behind the
once magnificent pretensions of the "king of kings" was revealed.
Had Antiochus acted with energy when in 192 he landed
in Greece, he might have won the day before the Roman
legions appeared. As it was, in spite of the warnings of Hannibal,5
who was now in his camp, and of the Aetolians, he
frittered away valuable time between his pleasures at Chalikis
and useless attacks on petty Thessalian towns. In 191
Glabrio landed at the head of an imposing force; and a single
battle at Abydus broke the courage of Antiochus, who
hastily recrossed the sea to Ephesus, leaving his Aetolian allies
to their fate. But Rome could not pause here. The safety
of her faithful allies, the Pergamenes and Rhodians, and of the
Greek cities in Asia Minor, as well as the necessity of chastising
Antiochus, demanded an invasion of Asia. A Roman fleet had
already (191) crossed the Aegean, and in concert with the fleets of
Pergamum and Rhodes worsted the navy of Antiochus.

In 190 the new consul L. Scipio, accompanied by his
famous brother, the conqueror of Africa, led the Roman legion
for the first time into Asia. At Magnesia ad Sipylum, in Lydia, he
met and defeated the motley and ill-disciplined hosts of the
great king.6 For the first time the West, under Roman leader-
ship, successfully encountered the forces of the East, and the
struggle began which lasted far on into the days of the
emperors. The terms of the peace which followed the
victory at Magnesia tell their own story clearly enough.
There is no question, any more than in
Greece, of annexation; the main object in view was that of
securing the predominance of Roman interests and influence

throughout the peninsula of Asia Minor, and removing to a safe
distance the only eastern power which could be considered
dangerous.7 The line of the Halys and the Taurus range, the
natural boundary of the peninsula eastward, was established
as the boundary between Antiochus and the kingdoms, cities
and peoples now enrolled as the allies and friends of Rome.
This line Antiochus was forbidden to cross; nor was he to send ships
of war farther west than Cape Sarpedon in Cilicia. Immediately
to the west of this frontier lay Bithynia, Paphlagonia and the
immigrant Celtic Galatae, and these states, now allies of Rome, served as a second line of defence against attacks
from the east. The area lying between these "buffer states" and the
Aegean was organized by Rome in such a way as should
at once reward the fidelities of all allies and secure both her own
paramount authority and safety from foreign attack. Pergamum
and Rhodes were so strengthened—the former by the gift of the
Chersonese, Lycaonia, Phrygia, Mysia and Lydia, the latter by that
of Lycia and Caria—as not only amply to reward their loyalty,
but to constitute them effective props of Roman interests and
effective barriers alike against Thracian and Celtic raids in the
north and Syrian aggression in the south. Lastly, the Greek cities
on the coast, except those already tributary to Pergamum, were
declared free, and established as independent allies of Rome.

In a space of little over eleven years (200-186)
Rome had broken the power of Alexander's successors
and established throughout the eastern Mediterranean a Roman protectorate.

It was in the western half of this protectorate that the first
steps in the direction of annexation were taken. The enthusiasm
provoked by the liberation of the Greeks had died
away, and its place had been taken by feelings of dis-
satisfaction ambition or sullen resentment. Intercourse
feuds and economic distress had brought many parts
of Greece to the verge of anarchy, and, above all, the
very foundations of the settlement effected in 197 were
threatened by the reviving power and aspirations of
Macedon. Loyally as Philip had aided Rome in the war
with Antiochus, the peace of Magnesia brought him nothing
but fresh humiliation. He was forced to abandon all hopes of
recovering Thessaly, and he had the mortification to see
the hated king of Pergamum installed almost on his borders
as master of the Thracian Chersonese. Resistance at the
time was unavailing, but from 189 until his death (179) he
laboured patiently and quietly to increase the internal res-
sources of his own kingdom,8 and to foment, by dexterous intrigue,
feelings of hostility to Rome among his Greek and barbarian
neighbours. His successor, Perseus, his son by a left-handed
alliance, continued his father's work. He made friends among
the Illyrian and Thracian princes, connected himself by marriage
with Antiochus IV. of Syria, and with Prusias of Bithynia,
and, among the Greek peoples, strove, not without success,
to revive the memories of the past glories of Greece under the
Macedonian leadership of the great Alexander.9 The senate
could no longer hesitate. They were well aware of the rest-
lessness and discontent in Greece; and after hearing from
Eumenes of Pergamum, and from their own officers, all details
of Perseus's intrigues and preparations, they declared war.10
The struggle, in spite of Perseus's courage and the incapacity at
the outset of the Roman commanders, was short and decisive.
The sympathy of the Greeks with Perseus, which had been
encouraged by the hitherto passive attitude assumed by Rome,
instantly evaporated on the news that the Roman legions were
on their way to Greece. No assistance came from Prusias of
Antiochus, and Perseus's only allies were the Thracian king Cotys
and the Illyrian Genthius. The victory gained by L. Aemilius
Paulus at Pydna (168) ended the war.11 Perseus
became the prisoner of Rome, and as such died in
Italy a few years later.12 Rome had begun the war with the
fixed resolution no longer of crippling but of destroying the Macedonian state. Perseus's repeated proposals for peace during the war had been rejected; and his defeat was followed by the final extinction of the kingdom of Philip and Alexander. Macedonia, though it ceased to exist as a single state, was not, however, definitely constituted a Roman province. On the contrary, the mistake was made of introducing some of the main principles of the provincial system—taxation, disarmament and the isolation of the separate communities—without the addition of the element most essential for the maintenance of order—that of a resident Roman governor. The four petty republics now created were each autonomous, and each separated from the rest by the prohibition of commercium and consulium, but no central controlling authority was substituted for that of the Macedonian king. The inevitable result was confusion and disorder, resulting finally (149-48) in the attempt of a pretender, Andrichus, who claimed to be a son of Perseus, to resuscitate the ancient monarchy.

In 148 the senate declared Macedon a Roman province, and placed a Roman magistrate at its head. From 189 to the defeat of Perseus in 168 no formal change of importance in the status of the Greek states had been made by Rome. The senate, though forced year after year to come to the mutual recriminations and complaints of rival communities and factions, contented itself as a rule with intervening just enough to remind the Greeks that their freedom was limited by its own paramount authority, and to prevent any single state or confederacy from raising itself too far above the level of general weakness which it was the interest of Rome to maintain. After the victory at Pydna, however, the sympathy shown for Perseus, exaggerated as it seems to have been by the interested representations of the romanizing factions in the various states, was made the pretext for a more emphatic assertion of Roman ascendancy. All those suspected of Macedonian leanings were removed to Italy, as hostages for the loyalty of their several communities, and the real motive for the step was made clear by the exceptionally severe treatment of the Achaenae, whose loyalty was not really doubtful, but whose growing power in the Peloponnesian independence and independence of language had awakened alarm at Rome. A thousand of their leading men, among them the historian Polybius, were carried off to Italy (see POLYBIUS). In Aetolia the Romans consoled in the massacre by their so-called friends of five hundred of the opposite party. Acarnania was weakened by the loss of Leucas, while Athens was rewarded for her unambitious loyalty by the gift of Delos and Samos.

But this somewhat violent experiment only answered for a time. In 148 the Achaenae rashly persisted, in spite of warnings, in attempting to compel Sparta by force of arms to submit to the league. When threatened by Rome with the loss of all that they had gained since Cynoscephalae, they madly rushed into war. They were easily defeated, and a "commission of ten," under the presidency of L. Mummius, was appointed by the senate thoroughly to settle the affairs of Greece. Corinth, by orders of the senate, was burnt to the ground and its territory confiscated. Thebes and Chalcis were destroyed, and the walls of all towns which had shared in the last desperate outbreak were razed to the ground. All the existing confederacies were dissolved; no commercium was allowed between one community and another. Everywhere an aristocratic type of constitution, according to the invariable Roman practice, was established, and the pay-

634

inactivity the disastrous results of which revealed themselves in the next period, in the rise of Mithradates of Pontus, the spread of Cretan and Cilician piracy, and the advance of Parthia.

Both the western and eastern Mediterraean now acknowledged the suzerainty of Rome, but her relations with the two were from the first different. The West fell to her as the prize of victory over Carthage, and, the Carthaginian power broken, there was no hindrance to the immediate establishment in Sicily, Sardinia, Spain, and finally in Africa, of direct Roman rule. To the majority, moreover, of her western subjects she brought a civilization as well as a government of a higher type than any before known to them. And so in the West she not only formed provinces but created a new and wider Roman world. To the East, on the contrary, she came as the liberator of the Greeks; and it was only slowly that in this part of the Empire her provincial system made way. In the East, moreover, the older civilization she found there obstinately held its ground. Her proconsuls governed and her legions protected the Greek communities, but to the last the East remained in language, manners and thought Greek and not Roman.

PERIOD II. THE REVOLUTION (146–90 B.C.).—In the course of little more than a century, Rome had become the supreme power in the civilized world. By all men, says Polybius, it was taken for granted that nothing remained but to obey the commands of the Romans. For the future the interest of Roman history centres in her attempts to perform the two Herculean tasks which this unique position laid upon her,—the efficient government of the subject peoples, and their defence against the barbarian races which swarmed around them on all sides. They were tasks under which the old republic constitution broke down, and which finally overtaxed the strength even of the marvellous organization framed and elaborated by Augustus and his successors. Although in its outward form the old constitution had undergone little change during the age of war and conquest from 265 to 146, the causes, both internal and external, which brought about its fall had been silently at work throughout. Its form was in strictness that of a moderate democracy. The patriciate had ceased to exist as a privileged caste, and there was no longer any order of nobility recognized by the constitution. The senate and the offices of state were in law open to all, and the will of the people in assembly had been in the most explicit and unqualified manner declared to be supreme alike in the election of magistrates, in the passing of laws, and in all matters touching the caput of a Roman citizen. But in practice the constitution had become an oligarchy. The senate, not the assembly, ruled Rome, and both the senate and the magistrates were in the hands of a class which, in defiance of the law, arrogated to itself the title and the privileges of a nobility. The ascendancy of the senate is too obvious and familiar a fact to need much illustration here. It was but rarely that the assembly was called upon to decide questions of policy, and then the proposal was usually made by the magistrate in obedience to the express directions of the senate. In the enormous majority of cases the matter was settled by a senator consilium, without any reference to the people at all. The assembly decides for war or peace, but the conduct of the war and the conditions of peace are matters left to the senate (q.p.). Now and then the assembly confers a command upon the man of its choice, or prolongs the imperium of a magistrate, but, as a rule, these and all questions connected with foreign affairs are settled within the walls of the senate-house. It is the senate which year by year assigns the commands and fixes the number and disposition of the military forces, directs the organization of a new province, conducts negotiations, and forms alliances. Within Italy, though its control of affairs was less exclusive, we find that, besides supervising the ordinary current business of administration, the senate decides questions connected with the Italian allies, sends out colonies, allot lands, and directs the suppression of disorders. Lastly, both in Italy and abroad it managed the finances. Inseparably connected with this monopoly of affairs to the exclusion of the assembly was the control which in practice, if not in theory, the senate exercised over the magistrates. The latter had come to have Cicero wrongly declared that "the chief magistrate is but a subject of the authority of the senate," and even the once formidable tribuni plebs are found during this period actively and loyally supporting the senate, and acting as its spokesmen in the assembly. The causes of this ascendancy of the senate are to be found firstly in the fact that the senate was the only body capable of conducting affairs in an age of incessant war. The voters in the assembly, a numerous, widely scattered body, could not readily be called together, and when assembled were very imperfectly qualified to decide momentous questions of military strategy and foreign policy. The senate, on the contrary, could be summoned in a moment, and included in its ranks all the skilled statesmen and soldiers of the commonwealth. The subordination of the magistrates was equally the result of circumstances, for, as the numbers of the magistrates, and also the area of government, increased, some central controlling power became absolutely necessary to prevent collisions between rival authorities, and to secure a proper division of labour, as well as to enforce the necessary concerted and co-operation. No such power could be found anywhere in the republican system but in the senate, standing as it necessarily did in the closest relations with the magistrate, and composed as it was increasingly of men who were or had been in office.

Once more, behind both senate and magistrates, lay the whole power and influence of the new nobility. These nobles were essentially distinct from the older and more legitimate aristocracy. Every patrician was of course noble, but the majority of the "noble families" in 146 were not patrician but plebeian. The title had been gradually appropriated, since the opening of the magistracies, by those families whose members had held the office, and had thereby acquired the ius imaginis. It was thus in theory within the reach of any citizen who could win election even to the curule aedilship, and, moreover, it carried with it no legal privileges whatsoever. Gradually,

1. Polyb. iii. 4.
2. The most important change was the assimilation of the division by classes and centuries with that by tribes, a change possibly due to the censorship of Gaius Flaminius in 220 (Mommsen, Staatsr. ii. 270). On this point see Comita.
3. A few other tribes or characters, however, still filled only by patricians, e.g. rex sacrorum, flaminius Dialis.
4. It became curio maximus in 209 (Livy xxvii. 8).
5. The lector senator was in the hands of the censors, but whether before Sulla's time their choice was subject to legal restrictions is doubtful (see Senate).
7. Ex auctoritate senatoris. The lex Flaminia agraria of 232 was an exception (Cic. De senect. 4; Polyb. ii. 21). In 167 B.C. a praetor brought the question of war with Rhodes directly before the assembly, but this was condemned as unprecedented (novo maloque exemplo, Liv. xiv. 21).
however, the ennobled plebeian families drew together, and combined with the older patrician gens to form a distinct order. Office brought wealth and prestige, and both wealth and prestige were liberally employed in securing for this select circle a monopoly of political power, and excluding new men. 1 Already by the close of the period it was rare for any one but a noble to find his way into high office or into the senate. The senate and magistrates are the mouthpieces of this order, and identified with it in policy and interest. Lastly, it must be allowed that both the senate and the nobility had to some extent justified their power by the use they made of it. It was their tenacity of purpose and devoted patriotism which had carried Rome through the dark days of the Hannibalic War. The heroes of the struggle with Carthage belonged to the leading families; the disasters at the Trasimenic Lake and at Cannae were associated with the blunders of popular favourites.

From the first, however, there was an inherent weakness in this senatorial government. It had no sound constitutional basis, and with the removal of its accidental supports it fell to the ground. Legally the senate had no positive authority. It could merely advise the magistrates, and the magistrates were only suggestions to the magistrate, which he was at liberty to accept or reject as he chose. 2 It had, it is true, become customary for the magistrate not only to ask the senate’s advice on all important points, but to follow it when given. But it was obvious that if this custom were weakened, and the magistrates chose to act independently, the senate was powerless. It might indeed anathematize 3 the refractory official, or hamper him if it could by setting in motion against him a colleague or the tribunes, but it could do no more, and these measures failed just where the senate’s control was most needed and most difficult to maintain—in its relations with the generals and governors of provinces abroad. The virtual independence of the proconsul was before 146 already exciting the jealousy of the senate and endangering its supremacy. 4 Nor again had the senate any legal hold over the assembly. Except in certain specified cases, it rested with the magistrates to decide whether any question should be settled by a decree of the senate or a vote of the assembly. 5 If he decided to make a proposal to the assembly, he was not bound except by custom to obtain the previous approval of the senate, and the constitution set no limits to the power of the assembly to decide any question whatsoever that was laid before it.

From 167, at least, onwards, there were increasing indications that both the acquiescence of the people in senatorial government and the loyalty of the magistrates to the senate were failing. The absorbing excitement of the great war had died away; the economic and social disturbance and distress which they produced were creating a growing feeling of discontent; and at the same time the senate provoked inquiries into its title to govern by its failure any longer to govern well. In the East there was confusion; in the West a single native chieftain defied the power which had crushed Carthage.

1 Livy xxi. 34. 
2 plebeios nobles...contemnere plebeem, ex quo contemni...deserint, coeptisse": cf. Sull., Jug. 41.
3"paucorum...verbis...admittere...senatus, provinciae, magistratus." Mommwn, Hist. of Rome, iii. 15. The number of new families enrolled dwindled rapidly after 200 B.C.; Willems, Le Senat de la republique romaine, t. 366 seq. (Paris, 1879).
4 The senators’ whole duty is "sententiam dicere." The senator was asked "quid censes?" the assembly "quid velit judicat?" Cf. also the saving clause, "Si desideret..." (Cic. consul., xc.) in Scit., e.g. Cic. Phil. v. 19, 53.
5 By declaring his action to be "contra rempublicam." The force of this anathema varied with circumstances. It had no legal value.
7 Hence the same things, e.g. founding of colonies, are done in one year by a Cunctm., in another by a lex; cf. Cic. De rep. ii. 32; 56; Phil. i. 2. 6 of Antony as consul, "mutata omnia, nihil per senatum, omnia per populum."
8 There was no legal necessity before Sulla’s time, for getting the sensus auctoritas for a proposal to the assembly.

In Rome the senate was becoming more and more simply an organ of the nobility, and the nobility were becoming every year more exclusive, more selfish, and less capable and unanimous. 7 But if the senate was not to govern, the difficulty arose of finding an efficient substitute, and it was this difficulty that mainly determined the issue of the struggles which convulsed Rome from 133 to 49. As the event showed, neither the assembly nor the numerous and disorganized magistracy was equal to the work; the magistrates were gradually pushed aside in favour of a more centralized authority, and the former became only the means by which this new authority was first encouraged in opposition to the senate and finally established in a position of impregnable strength. The assembly which made Pompey and Caesar found out too late that it could not unmakethem.

It is possible that these constitutional and administrative difficulties would not have proved so rapidly fatal to the Republic had it not its very foundations been sapped by the changes which followed more or less directly on the conquests of the 3rd and 2nd centuries B.C. For the opening of the world to Rome, and of Rome to the world, introduced a new era of political history of the Roman state. The subjugation of the Mediterranean countries, by placing at the disposal of Rome the vast natural resources of the West and the accumulated treasures of the East, caused a rapid rise in the standard of wealth and a marked change in its distribution. The Roman state was enabled to dispense with the direct taxation of its citizens, 8 since it derived all the revenue which it needed from the subject countries. But the wealth drawn from the provinces by the state was trifling in amount compared with that which flowed into the pockets of individual citizens. Not only was the booty taken in war largely appropriated by the Roman commanders and their men, but a host of money-makers settled upon the conquered provinces and exploited them for their profit. The nobles engaged in the task of administration, the contractors (publicani) who farmed the revenues, and the "men of business" (negotiatores) who, as money-lenders, merchants or speculators, penetrated to every corner of the Empire, reaped a rich harvest at the expense of the provincials. Farming in Italy on the old lines became increasingly laborious and unprofitable owing to the importation of foreign corn and foreign slaves; and capitalists sought easier methods of acquiring wealth. If this had meant that capital was expended in developing the natural resources of the provinces, the result would have been to increase the prosperity of the countries subject to Rome; but it was not so. The Roman negotiatores, who were often merely the agents of the great families of Rome, drained the accumulated wealth of the provinces by lending money to the subject communities at exorbitant rates of interest. Cicero, for example, found when governor of Cilicia that M. Junius Brutus had lent a large sum to the people of Salamis in Cyprus at 48% compound interest; and we cannot suppose that this was an exceptional case. Such practices as these, together with the wasteful and oppressive system of tax-farming, and the deliberate extortions carried on by senatorial governors, reduced the flourishing cities of the Greek East, within the space of two generations, to utter economic exhaustion.

But the reaction of the same process on Rome herself had far more important consequences. The whole structure of Roman society was altered by the decay of the equality and homogeneity which had once been its chief characteristics were at last destroyed. The Roman nobles had not merely ceased, as in old days, to till their own farms; they had found a means of enriching themselves beyond the dreams of avarice,
and when they returned from the government of a province it
was to build sumptuous villas, filled with the spoils of Greece
and Asia, to surround themselves with troops of slaves and
dependents, and to live rather as princes than as citizens of
a republic. The publicani and negotiatores formed a second
order in the state, which rivalled the first in wealth and
coveted a share in its political supremacy; while the third estate, the
plebs urbana, was constantly increasing in numbers and at the
same time sinking into the condition of an idle proletariat.
The accentuation of class distinctions is indeed inevitable in a
capitalist society, such as that of Rome was now becoming.
But the process was fraught with grave political danger owing
to the peculiarities of the Roman constitution, which rested in
theory on the ultimate sovereignty of the people, who were in
practice represented by the city mob. To win the support of
the plebs became a necessity for ambitious politicians, and the
means employed for this end poisoned the political life of Rome.
The wealth derived from the provinces was freely spent in
bribery, and the popular plebs were encouraged to claim as
the price of its support a share in the spoils of empire.

It was not only the structure and composition of Roman
society that underwent a transformation. The victory of
Rome in her struggle for supremacy in the Medi-
terranean basin had been largely due to the powerful
conservative forces by which her institutions were
preserved from decay. Respect for the mos majorum,
or ancestral custom, imposed an effective check on the desire
for innovation. Though personal religion, in the deeper sense,
was foreign to the Roman temperament, there was a genuine
belief in the gods whose favours had made Rome great in the
past and would uphold her in the future so long as she
trud in the old paths of loyalty and devotion. Above all,
the healthy moral traditions of early Rome were maintained
by the discipline of the family, resting on the supreme authority
of the father—the patria potestas—and the powerful influence
of the mother, to whom the early training of the child was
entrusted. Finally, the institution of the censorship, backed
as it was by the mighty force of public opinion, provided a
deterrent which prevented any flagrant deviation from the
accepted standard of morals. All this was changed by the
influence of Greek civilization, with which Rome was first
brought face to face in the 3rd century B.C. owing to her
relations with Magna Graecia. At first the results of contact
with the older and more brilliant culture of Hellas were on the
whole good. In the 2nd century B.C., when constant intercourse
was established with the communities of Greece proper and
of Asia Minor, "philhellenism" became a passion, which was
strongest in the best minds of the day and resulted in a quickened
intellectual activity, wider sympathies and a more humane
life. But at the same time the "new learning" was a disturbing
and unsettling force. The Roman citizen was confronted with
new doctrines in politics and religion, and initiated into the
speculations of critical philosophy. Under the influence
of this powerful solvent the fabric of tradition embodied in the
mos majorum fell to pieces; a revolt set in against Roman
discipline and Roman traditions of self-effacement, and the
craving for individual distinction asserted itself with irresistible
vehemence. As it had been in the days of the "Sophistic"
movement at Athens, so it was now with Rome; a higher
education, which, owing to its expense, was necessarily confined
to the wealthier classes, interposed between the upper and lower
ranks of society a barrier even more effectual than that set up
by differences of material condition, and by releasing the indi-
vidual from the trammels of traditional morality, gave his
freedom and its effect on private morals may be
gauged by the vehemence with which the reactionary opposi-
tion, headed by M. Porcius Cato (consul, 195 B.C.; censor, 184
B.C.), inveighed against the new fashions, and by the
list of measures passed to check the growth of luxury
and licence, and to exclude the foreign teachers of the new
learning. It was all in vain. The art of rhetoric, which
was studied through the medium of Greek treatises and Greek
models, furnished the Roman noble with weapons of attack
and defence of which he was not slow to avail himself in the
forum and the senate-house. In the science of money-making,
which had been elaborated under the Hellenistic monarchies,
the Roman capitalists proved apt pupils of their Greek teachers.
Among the lower classes, contact with foreign slaves and freed-
men, with foreign worship and foreign vices, produced a love
of novelty which no legislation could check. Even amongst
women there were symptoms of revolt against the old order,
which showed itself in a growing freedom of manners and
impatience of control, the marriage tie was relaxed, and the
respect for mother and wife, which had been so powerful a
factor in the development of Roman society, was grievously diminished. Thus Rome was at length brought
to face to face with a moral and economic crisis which a modern
historian has described in the words: "Italy was living through
the fever of moral disintegration and incoherence which assails
all civilized societies that are rich in the manifold resources
of culture and enjoyment, but tolerate few or no restraints on
the feverish struggle of contending appetites." In this struggle
the Roman Republic perished, and personal government took
its place. The world had outgrown the city-state and its
political machinery, and as the notions of federalism (on any
large scale) and representative government had not yet come
into being, no solution of the problem was possible save that of
absolutism. But a far stronger resistance would have been
opposed to political revolution by the republican system had
not public morals been sapped by the influences above described.
A state of corruption was produced to a scintilla¹ for the benefit
of individuals who were often faced with the alternative of
ruin or revolution; there was no longer any body of sound
public opinion to which, in the last resort, appeal could be
made; and, long before the final catastrophe took place, Roman
society itself had become, in structure and temper, thoroughly un-
republican.
The first systematic attack upon the senatorial government
is connected with the names of Tiberius and Gaius Gracchus
(Gracchi) and its immediate occasion was an attempt to
deal with no less a danger than the threatened dis-
appearance of the class to which of all others Rome
owed most in the past. The small landholders throughout the
greater part of Italy were sinking deeper into ruin under the pressure of accumulated difficulties. The Hannibalic war had laid waste their fields and thinned their numbers, nor when, in 183, it returned to Italy did it bring with it
the hope of an easy victory. The heavy burden of military service still pressed ruinously upon them, and in addition they were called upon to compete with the foreign corn
importers.

1 From 181 B.C. onwards a succession of laws de ambitu were passed to prevent bribery, but without effect.
2 Cf. Tacitus, account of Cornelia, the mother of the Gracchi, and Aurelia, the mother of Julius Caesar, in the dialogue De oratoribus, c. 28.
3 It is to be noted that these subjects were, generally speaking, taught by freedmen or slaves.

For authorities, see under GRACCHUS.

To Spain alone more than 150,000 men were sent between 196 and 169 (Jnhn iii. 319): compare the reluctance of the people to
declare war against Macedon in 200 B.C., and also the case of Spurius Ligustinus in 171 (Liv. xili. 34).

The Gracchi, 153-21 B.C., 621-33.

6 Divorce was unknown at Rome until 231 B.C. (Dionsys. ii. 25).

14 In 161 B.C. a decree of the senate was passed against "philosophi-
erhetores Latini, uti Romae ne essent" (Gell. xvi. 11). In 155 B.C. the philosopher Carneades was expelled from Rome (Plut. Cato. 22).

20 to authorities, see under GRACCHUS.

184 B.C.

15 In the Ciceronian period the lower classes of Rome, with whom the power in the comitia rested, were openly organized for purposes of bribery by means of collegia and sodalicia, nominally religious bodies.

16 Caesar had accumulated debts amounting to £800,000 by the time of his praetorship. Caetilin and his fellow-bankrupts, amongst others, had several women, including several Spanish who, as we are told by Sallust, "danced and played better than an honest
woman need do," hoped to bring about a cancelling of debts (nova
libera).
imported from beyond the sea, and with the foreign slave-labour purchased by the capital of wealthier men. Farming became unprofitable, and the hard laborious life with its scanty returns was thrown into still darker relief when compared with the stirring life of the camps with its opportunities of booty, or with the cheap provisions, frequent largesses and gay spectacles to be had in the large towns. The small holders went off to follow the eagles or swell the proletariat of the cities, and their holdings were left to run waste or merged in the vineyards, oliveyards and above all in the great cattlefarms of the rich, and their own place was taken by slaves. The evil was worst in Etruria and in southern Italy; but everywhere it was serious enough to demand the earnest attention of Roman statesmen. Of its existence the government had received plenty of warning in the declining numbers of able-bodied males returned at the census, in the increasing difficulties of recruiting for the legions, in servile outbreaks in Etruria and Apulia, and between 100 and 160 a good deal was attempted by way of remedy. In addition to the foundation of twenty colonies, there were frequent allotments of land to veteran soldiers, especially in Apulia and Samnium. In 160, 40,000 Ligurians were removed from their homes and settled on vacant lands, since the recent conquest over the Samnite tribe, and in 160 the Pompeian marshes were drained for the purpose of cultivation. But these efforts were only partially successful. The colonies planted in Cisalpine Gaul and in Picenum flourished, but of the others the majority slowly dwindled away, and two required re-colonizing only eight years after their foundation. The veterans who received land were unfitted to make good farmers; and large numbers, on the first opportunity, gladly returned as volunteers to a soldier's life. Moreover, after 160 even these efforts ceased, and with the single exception of the colony of Auxinum in Picenum (157) nothing was done to check the spread of the evil, until in 133 Tiberius Gracchus, on his election to the tribunate, set his hand to the work.

The remedy proposed by Gracchus amounted in effect to the resumption by the state of as much of the "common land" as was not held in occupation by authorized persons and conformably to the provisions of the Licianian law, during the absence in allotments for the purpose of making them thus rescued for the community from the monopoly of a few. It was a scheme which could quote in its favour ancient precedent as well as urgent necessity. Of the causes which led to its ultimate failure something will be said later on; for the present we must turn to the constitutional conflict which it provoked. The senate from the first identified itself with the interests of the wealthy occupiers, and Tiberius found himself forced into a struggle with that body, which had been no part of his original plan. He fell back on the legislative sovereignty of the assembly; he resuscitated the half-forgotten powers of interference vested in the tribunate in order to paralyse the action of the senatorial magistrates, and finally lost his life in an attempt to make good one of the weak points in the tribune's position by securing his own re-election for a second year. But the conflict did not end with his death. It was

renewed on a wider scale, and with a more deliberate aim by his brother Gaius, who on his election to the tribunate (123) once again came forward as the avowed enemy of the senatorial aristocracy. The latter suddenly found its control of the administration threatened by a strong opposition. The invitation of the popular tribune the assembly proceeded to restrict the senator's freedom of action in assigning the provinces. It regulated the taxation of the province of Asia and altered the conditions of military service. In home affairs it inflicted two serious blows on the senate's authority by declaring the summary punishment of Roman citizens by the consuls on the strength of a senatus consultum to be a violation of the law of appeal, and by taking out of the senate's hands the control of the newly established court for the trial of cases of magisterial misgovernment in the provinces. Tiberius had committed the mistake of relying too exclusively on the support of one section only of the community; his brother endeavoured to enlist on the popular side every available ally. The Latins and Italians had opposed an agrarian scheme which took from them land which they had come to regard as rightfully theirs, and gave them no share in the benefit of the allotments. Gaius not only removed this latter grievance, but ardently supported and himself brought forward the law which provided the useful enforcement of their emancipation. The indiffERENCE of the city populace, to whom the prospect of small holdings in a remote district of Italy was not a tempting one, was overcome by the establishment of regular monthly doles of corn at a low price. Finally, the men of business—the publicans, merchants and money-lenders—were conciliated by the privilege granted to them of collecting the tithes of the new province of Asia, and placed in direct rivalry with the senate by the substitution of men of their own class as judges in the "quaestio de repetundis," in place of senators. The organizer of this concerted attack upon the position of the senate fell, like his brother, in a riot.

The agrarian reforms of the two Gracchi had little permanent effect. Even in the lifetime of Gaius the clause in his brother's law rendering the new holdings inalienable was repealed, and the process of absorption recommenced. In 118 a stop was put to further allotment of occupied lands, and finally, in 111, the whole position of the agrarian question was altered by a law which confirmed all lands still held in open occupation into private land. The old controversy as to the proper use of the lands of the community was closed by this act of alienation. The controversy in future turns, not on the right of the poor

citizens to the state lands, but on the expediency of purchasing other lands for distribution at the cost of the treasury.\(^1\) But, though the agrarian reform failed, the political conflict it had provoked continued, and the lines on which it was waged were in the main those laid down by Gaius Gracchus. The sovereignty of the assembly continued to be the watchword of the popular party, and a free use of the tribunial powers of interference and of legislation remained the most effective means of accomplishing their aims.

Ten years after the death of Gaius the populares once more summoned up courage to challenge the supremacy of the senate; but it was on a question of foreign administration that the conflict was renewed. The course of affairs in the client state of Numidia since Micipia's death in 118 had been such as to discredit a stronger government than that of the senate.\(^2\) In defiance of Roman authority, and relying on the influence of his own well-spent gold, Jugurtha had murdered both his legitimate rivals, Hiempsal and Adherbal, and had made himself master of Numidia. The declaration of war wrong from the senate (112 b.C.) by popular indignation had been followed by the corruption of a consul\(^3\) (111) and the crushing defeat of the proconsul Albinus.\(^4\) On the news of this crowning disaster the storm burst, and on the proposal of the tribunes a commission of inquiry was appointed into the conduct of the war.\(^5\) But the popular leaders did not stop here. Q. Caecilius Metellus, who as consul (109) had succeeded to the command in Numidia, was an able soldier but a rigid aristocrat; and they now resolved to improve their success by entrusting the command instead to a genuine son of the people. Their choice fell on Gaius Marius (see Marius), an experienced officer and administrator, but a man of humble birth, wholly illiterate, and one who, though no politician, was by temperament and training a hater of the polished and effeminate nobles who filled the senate.\(^6\) He was triumphantly elected, and, in spite of a decree of the senate continuing Metellus as proconsul, he was entrusted by a vote of the assembly with the charge of the war against Jugurtha (g.v.).\(^7\)

Jugurtha was vanquished; and Marius, who had been a second time elected consul in his absence, arrived at Rome in January 104, bringing the captive prince with him in chains.\(^8\) But further triumphs awaited the popular hero. The Cimbri and Teutones were at the gates of Italy; they had four times defeated the senatorial generals, and Marius was called upon to save Rome from a second invasion of the barbarians.\(^9\) After two years of suspense the victory at Aquae Sextiae (102), followed by that on the Raudine plain (101), put an end to the danger by the annihilation of the invading hordes; and Marius, now consul for the fifth time, returned to Rome in triumph. There the popular party welcomed him as a leader with all the prestige of a successful general. Once more, however, they were destined to a brief success followed by disaster. Marius became for the sixth time consul;\(^10\) of the two popular leaders Glaucia became praetor and Saturninus tribune. But Marius and his allies were not statesmen of the stamp of the Gracchi; and the laws proposed by Saturninus had evidently no serious aim in view other than that of harassing the senate. His corn law merely reduced the price fixed in 123 for the monthly dole of corn, and the main point of his agrarian law lay in the clause appended to it requiring all senators to swear to observe its provisions.\(^11\) The laws were carried, but the triumph of the popular leaders was short-lived. Their recklessness and violence had alienated all classes in Rome; and their period of office was drawing to a close. At the elections fresh rioting took place, and Marius as consul was called upon by the senate to protect the state against his own partisans. Saturninus and Glaucia surrendered, but while the senate was discussing their fate they were surrounded and murdered by their opponents.

The popular party had been worsted once more in their struggle with the senate, but none the less their alliance with Marius, and the position in which their votes placed him, marked an epoch in the history of the revolution. The transference of the political leadership to a consul who was nothing if not a soldier was at once a confession of the insufficiency of the purely civil authority of the tribune and a dangerous encouragement of military interference in political controversies. The consequences were already foreshadowed by the special provisions made by Saturninus for Marius's veterans, and in the elective part taken by them in the passing of his laws. Indirectly, too, Marius, though no politician, played an important part in this new departure. His military reforms\(^12\) at once democratized the army and attached it more closely to its leader for the time being. He swept away the last traces of civil distinctions of rank or wealth within the legion, admitted to its ranks all classes, and substituted voluntary enlistment under a popular general for the old-fashioned compulsory levy. The efficiency of the legion was increased at the cost of a complete severance of the ties which bound it to the civil community and to the civil authorities.

The next important crisis was due partly to the rivalry which had been growing more bitter each year between the senate and the commercial class, and partly to the long-impending question of the enfranchisement of the Italian allies.\(^13\) The publicani, negotiatores and others, who constituted what was now becoming known as the equestrian order (see EQUITES), had made unscrupulous use of their control of the courts and especially of the quaestio de repetundis against their natural rivals, the official class in the provinces. The threat of prosecution before a hostile jury was held over the head of every governor, legate and quaestor who ventured to interfere with their operations in the provinces. The average official preferred to connive at their exactions; the bolder ones paid with fines and even exile for their courage. In 92 the necessity for a reform was proved beyond a doubt by the scandalous condemnation of P. Rutilius Rufus,\(^14\) ostensibly on a charge of extortion, in reality as the reward of his efforts to check the extortions of the Roman equites in Asia. The difficulties of the Italian question were more serious. That the Italian allies were discontented was notorious. After nearly two centuries of close alliance, of common dangers and victories, they now eagerly coveted as a boon that complete amalgamation with Rome which they had at first resented as a dishonor. But, unfortunately, Rome had grown more exclusive in proportion as the value set upon Roman citizenship increased. During the last forty years feelings of hope and disappointment had rapidly succeeded each other; Marcus Fulvius Flaccus, Gaius Gracchus, Saturninus, had all held out promises of relief—and nothing had yet been done. On each occasion they had crowded to Rome, full of eager expectation, only to be harshly ejected from the city by the consul's orders.\(^15\) The justice of their claims could hardly be denied, the danger of continuing to ignore them was obvious—yet the difficulties in the way of granting them were formidable in the extreme, and from a higher than a merely selfish point of view there was much

4 Livy, Epit. lxxii.; Appian, B. C. i. 28 seq.
enacted that any citizen of an allied community then domiciled in Italy might obtain the franchise by giving in his name to a praetor in Rome within sixty days. A third law (lex Calpurnia), apparently passed at the same time, empowered Roman magistrates in the field to bestow the franchise there and then upon all who were willing to receive it. This sudden opening of the closed gates of Roman citizenship was completely successful, and its effects were at once visible in the diminished vigour of the insurgents. By the end of 89 the Samnites and Lucanians were left alone in their obstinate hostility to Rome, and neither, thanks to Sulla's brilliant campaign in Samnium, had for the moment any strength left for active aggression.

The termination of the Social War brought with it no peace in Rome. The old quarrels were renewed with increased bitterness, and the newly enfranchised Italians themselves complained as bitterly of the restriction which robbed them of their due share of political influence by allowing them to vote only in a specified number of tribes. The senate itself was distracted by violent personal rivalries—and all these feuds, animosities and grievances were aggravated by the widespread economic distress which afflicted all classes. Lastly, war with Mithradates VI had been declared; it was notorious that the privilege of commanding the force to be sent against him would be keenly contested, and that the contest would lie between the veteran Marius and L. Cornelius Sulla.

It was in an atmosphere thus charged with the elements of disturbance that P. Sulpicius Rufus as tribune brought forward his laws. He proposed (1) that the command of the Mithridatic war should be given to Marius, (2) that the new citizens should be distributed through all the tribes, (3) that the freedmen should no longer be confined to the four city tribes, (4) that any senator owing more than 2000 denarii should lose his seat, (5) that those exiled on suspicion of complicity with the Italian revolt should be recalled. These proposals inevitably provoked a storm, and both sides were ominously ready for violent measures. The consuls, in order to prevent legislation, proclaimed a public holiday. Sulpicius replied by arming his followers and driving the consuls from the forum. The proclamation was withdrawn and the laws carried, but Sulpicius was shortly after murdered. From Nola in Campania, where lay the legions commanded by him in the Social War, Sulla advanced on Rome, and for the first time a Roman consul entered the city at the head of the legions of the Republic. Resistance was hopeless. Marius and Sulpicius fled, and Sulla, summoning the assembly of the centuries, proposed the measures he considered necessary for the public security, the most important being a provision that the sanction of the senate should be necessary before any proposal was introduced to the assembly. Then, after waiting in Rome long enough to hold the consular elections, he left for Asia early in 87.

Sulla had conquered, but his victory cost the Republic dear. He had first taught political partisans to look for final success, not to a majority of votes in the forum or campus, but to the swords of the soldiery. The lesson was well learnt. Shortly after his departure L. Cornelius Cinna as consul revived the proposals of Sulpicius; his colleague, Gnaeus Octavius, at the head of an armed force fell upon the new citizens who had collected in crowds to vote, and

and the forum was heaped high with the bodies of the slain.\(^1\) Cinna fled, but fled, like Sulla, to the legions. When the senate declared he had defamed its ancient glory by treason, the whole of the soldiery in Campania in behalf of the violated rights of the people and the injured dignity of the consuls, and, like Sulla, found them ready to follow where he led. The neighbouring Italian communities, who had lost many citizens in the recent massacre, sent their new champion men and money;\(^2\) while from Africa, whither he had escaped after Sulla's entry into Rome, came Marius with 1000 Numidian horsemen. The senate had prepared for a desperate defence, but fortune was adverse, and after a brief resistance they gave way. Cinna was acknowledged as consul, the sentence of outlawry passed on Marius was revoked and Cinna and Marius entered Rome with their troops. Marius's thirst for revenge was gratified by a frightful massacre, and he lived long enough to be nominated consul for the seventh time. But he held his consulsip only a few weeks. Early in 86 he died, and for the next three years Cinna ruled Rome. Constitutional government was virtually suspended. For 85 Cinna nominated himself and his trusted colleague as consuls. The state says without lawful authority.\(^3\) One important matter was carried through—the registration in all the tribes of the newly enfranchised Italians,\(^4\) but beyond this little was done. The attention of Cinna and his friends was in truth engrossed by the ever-present dread of Sulla's return from Asia. The consul of 86, L. Valerius Flaccus (who had been consul with Marius in 100 B.C.), sent out to him, was murdered by his own soldiers at Nicomedea.\(^5\) In 85 Sulla, though disinposed by his government, concluded a peace with Mithradates.\(^6\) In 84, after settling affairs in Asia and crushing Flaccus's successor, C. Flavius Fimbria, he crossed into Greece, and in the spring of 83 landed at Brundusium with 40,000 soldiers and a large following of émigré nobles. Cinna was dead,\(^7\) murdered like Flaccus by his mutinous soldiery; his most trusted colleague, Cn. Papirius Carbo, was commanding as proconsul in Cisalpine Gaul; and the resistance offered to Sulla's advance was slight. At Capua, Sulla routed the forces of one consul, Gaius Norbanus; at Neamn the troops of the other went over in a body to the side of the outlawed proconsul. After a winter spent in Campania he pressed forward to Rome, defeated the younger Marius (consul, 82) near Praeneste, and entered the city without further opposition. In north Italy the success of his lieutenants, Q. Caecilius Metellus Pius (son of Metellus Numidicus), Cn. Pompeius and Marcus Crassus, had been fully as decisive. Cisalpine Gaul, Umbria and Etruria had all been won for Sulla, and the two principal leaders on the other side, Carbo and Norbanus, had each fled, one to Rhodes, the other to Africa. Only one foe remained to be conquered. The Sammites and Lucanians whom Cinna had conciliated, and who saw in Sulla their bitterest foe, were for the last time in arms, and had already joined forces with the remains of the Marian army close to Rome. The decisive battle was fought outside the walls of the city, and ended in the complete defeat of Cinna's and the Sammite army.\(^8\)

For a period of nearly ten years Rome and Italy had been distracted by civil war. Sulla was now called upon to heal the divisions which rent the state asunder, to set in working again the machinery of civil government, and above all to modify it to meet the altered conditions, and to fortify it against the dangers which visibly threatened it in the future. The real charge against Sulla\(^9\) is not that he failed to accomplish all this, for to do so was beyond the powers even of a man so able, resolute and self-confident as Sulla, armed though he was with absolute authority and backed by overwhelming military strength and the prestige of unbroken success. He stands convicted rather of deliberately aggravating some and culpably ignoring others of the evils he should have tried to cure, and of contenting himself with a party triumph when he should have aimed at the regeneration and confirmation of the whole state. His victory was instantly followed, not by any measures of conciliation, but by a series of massacres, proclamations and confiscations, of which almost the least serious consequence was the immediate loss of life which they entailed.\(^10\) From this time forward the fear of proscription and confiscation recurred as a possible consequence of every political crisis, and it was with difficulty that Caesar himself, who had so long dissipated the belief that his victory would be followed by a Sullan reign of terror. The legacy of hatred and discontent which Sulla left behind him was a constant source of disquiet and danger. In the children of the proscribed, whom he excluded from holding office, and the dispossessed owners of the confiscated lands, every agitator found ready and willing allies.\(^11\) The moneyed men of the equestrian order were more than ever hostile to the senatorial government, which they now identified with the man who cherished towards them a peculiar hatred,\(^12\) and whose creatures had hunted them down like dogs. The attachment which the new Italian citizens might in time have learnt to feel for the old republican constitution was nipped in the bud by the massacres at Praeneste and Norba, by the harsh treatment of the ancient towns of Etruria, and by the ruthless desolation of Samnium and Lucania.\(^13\) Quite as fatal were the results to the economic prosperity of the peninsula. Sulla's confiscations, following the civil and social wars, opened the doors wide for a long train of evils. The veterans whom he planted on the lands he had seized did nothing for agriculture, and swelled the growing numbers of the turbulent and discontented.\(^14\) The "Sullan men" became as great an object of fear and dislike as the "Sullan reign."\(^15\) The latifundia increased with startling rapidity—whole territories passing into the hands of greedy partisans.\(^16\) Wide tracts of land, confiscated but never allotted, ran to waste.\(^17\) In all but a few districts of Italy the free population finally and completely disappeared from the open country; and life and property were rendered insecure by the brigandage which now developed unchecked, and in which the herdsmen slaves played a prominent part. The outbreaks of Spartacus in 73, and of Catiline ten years later, were significant commentaries on this part of Sulla's work.\(^18\) His constitutional legislation, while it included many useful administrative reforms, is marked by as violent a reaction as apparent to the blindness to the future. The re-establishment on a legal basis of the ascendancy which custom had so long accorded to the

senate was his main object. With this purpose he had already, when consul in 88, made the senatus auctoritas legally necessary for proposals to be considered. He now as dictator followed this up by crippling the power of the magistracy, which had been the most effective weapon in the hands of the senate's opponents. The legislative freedom of the tribunes was already hampered by the necessity of obtaining the senate's sanction; in addition, Sulla restricted their wide powers of interference (intercessio) to their original purpose of protecting individual plebeians, and disciplined the office by prohibiting a tribune from holding any subsequent office in the state. The control of the courts (quaestiones perpetuae) was taken from the equestrian order and restored to the senate. To prevent the people from suddenly installing and keeping in high office a second Marius, he re-enacted the old law against re-election, and made legally binding the custom which required a man to mount up gradually to the consulship through the lower offices. He increased the number of the praetors from six to eight, and of quaestors to twenty, though required by administrative necessities, tended, by enlarging the numbers and further dividing the authority of the magistrates, to render them still more dependent upon the central direction of the state. Lastly, he replaced the pontifical and augural colleges in the hands of the senatorial nobles, by enacting that vacancies in them should, as before the lex Domitia (104), be filled up by co-optation. It cannot be said that Sulla was successful in fortifying the republican system against the dangers which menaced it from without. He accepted as an accomplished fact the enfranchisement of the Italians, but he made no provision to guard against the consequent reduction of the comitia to an absurdity, and with them of the civic government which rested upon them, or to organize an effective administrative system for the Italian communities. Of an effective tenure Sulla had the best reason to appreciate the dangers to be feared from the growing independence of governors and generals in the provinces, and from the transformation of the old civic militia into a group of professional armies, devoted only to a successful leader, and with the weakest possible sense of allegiance to the state. He had himself, as proconsul of Asia, contemptuously and successfully defied the local government, and he, more than any other Roman general, had taught his soldiers to look only to their leader, and to think only of booty. Yet, beyond a few inadequate regulations, there is no evidence that Sulla dealt with these burning questions, the settlement of which was among the greatest of the achievements of Augustus. One administrative reform of real importance must, lastly, be set down to his credit. The judicial procedure first established in 149 for the trial of cases of magisterial extortion in the provinces, and applied between 149 and 81 to cases of treason and bribery, Sulla extended so as to bring under it the chief criminal offences, and thus laid the foundations of the Roman criminal law.

The Sullan system stood for nine years, and was then overthrown—as it had been established—by a successful soldier. Overthrow of the Sullan constitution. 670-684.

Sulla was forty years of age when he made his first appearance in the political life of Rome. He was the son of a distinguished family, and was born in 83. He had already rendered himself conspicuous in the public career on several occasions, and was made aedile at nineteen, praetor at thirty-five, and consul at forty. In the last year of his consulship he was elected to the censorship, and had the honour of proposing the Senate the establishment of a new republic. It was a mere pretence. Sulla himself had the chief voice in the new constitution, and secured the enfranchisement of one hundred thousand Italians. The use of the Sullan system was afterwards made the subject of much dispute among the ancient jurists. Was it legal? for it was the result of an arbitrary act by a dictator, and was this act binding, because it was in conformity with the law? Was the new constitution, therefore, null and void? The decision of the jurists was, for the most part, in favour of its legality. The constitution was an established fact, and it had lasted for many years, the jurists therefore accepted it, and it was finally confirmed by the peace of Actium. In the year 155, a decree was passed by the Senate, in which the Sullan constitution was legalized. The following is a translation of the passage:

"Quo consilio, quo majestate, contra morem multorum, tenui consulatrum antiquum restituti,"--Ecclesiastical history of the Middle Ages, T. Biscoe, 1884, p. 238.
a leader in order successfully to attack a government discredited by failure at home and abroad. With the return of Pompey from Spain their opportunity came. Pompey, who understood politics as little as Marius, was anxious to obtain a triumph, the consulship for the next year (70), and as the natural consequence of this an important command in the East. The opposition wanted his name and support, and a bargain was soon struck. Pompey and with him Marcus Licinius Crassus, the real conqueror of Spartacus, were elected consuls, almost in the presence of their troops, which lay encamped outside the gates in readiness to assist at the triumph and ovation granted to their respective leaders. Pompey lost no time in performing his part of the agreement. The tribunes regained their prerogatives. The "perpetual courts" (questiones perpetue) were taken out of the hands of the senatorial judiciums, who had outdone the equestrian order in scandalous corruption, and finally the censors, the first since 86 B.C., purged the senate of the more worthless and disreputable of Sulla's partisans. The victory was complete; but for the future its chief significance lay in the clearness with which it showed that the final decision in matters political lay with neither of the two great parties in Rome, but with the holder of the military authority. The tribunes ceased to be political leaders and became lieutenants of the military commanders, and the change was fatal to the dignity of politics in the city. Men became conscious of the unreality of the old constitutional controversies, indifferent to the questions which agitated the forum and the curia, and contemptuously ready to alter or disregard the constitution itself when it stood in the way of interests nearer to their hearts.

When his consularship ended, Pompey impatiently awaited at the hands of the politicians he had befriended the further gift of a foreign command. He declined an ordinary province, and from the end of 70 to 67 he remained at Rome in a somewhat affectedly dignified seclusion. But in 67 and 66 the laws of Gabinius and Manlius gave him all and more than all that he expected (see POMPEY). By the former he obtained the sole command for three years against the Mediterranean pirates. He was to have supreme authority over all Roman magistrates in the provinces throughout the Mediterranean and over the coasts for 50 miles inland. Fifteen legati, all of praetorian rank, were assigned to him, with two hundred ships, and as many troops as he thought desirable. The Manilian law transferred from Lucullus and Gabrio to Pompey the conduct of the Mithradatic War in Asia, and with it the entire control of Roman policy and interests in the East. The republican character of the position thus granted to Pompey, and the dangers of the precedent established, were clearly enough pointed out by such moderate men as Q. Lutatius Catulus, the "father of the senate," and by the orator Hortensius—but in vain. Both laws were supported, not only by the tribunes and the populace, but by the whole influence of the publicani and negotiatores, who considered the state of things as a great improvement.

Pompey left Rome in 67. In a marvellously short space of time he freed the Mediterranean from the Cilician pirates and established Roman authority in Cilicia itself. He then crushed Mithradates, added Syria to the list of Roman provinces, and led the Roman legions to the Euphrates and the Caspian, leaving no power capable of disputing with Rome the sovereignty of western Asia. He did not return to Italy till towards the end of 62. The interval was marked in Rome by the rise to political importance of Caesar and Cicero, and by Catiline's attempt at revolution. As the nephew of Marius and the son-in-law of Cinna, Caesar possessed a strong hereditary claim to the leadership of the popular and Marian party. He had already taken part in the agitation for the restoration of the tribunate; he had supported the Manilian law; and, when Pompey's withdrawal left the field clear for other competitors, he stepped at once into the front rank on the popular side. He took upon himself, as their nearest representative, the task of clearing the memory and avenging the wrongs of the great popular leaders, Marius, Cinna and Saturninus. He publicly reminded the people of Marius's services, and set up again upon the Capitol the trophies of the Cimbrian War. He endeavoured to bring to justice, not only the ringleaders in Sulla's bloody work of proscription, but even the murderers of Saturninus, and vehemently pleaded the cause of the children of the proscribed. While thus carrying on in genuine Roman fashion the feud of his family, he attracted the sympathies of the Italians by his efforts to procure the Roman franchise for the Latin communities beyond the Po, and won the affections of the populace in Rome and its immediate neighbourhood by the splendour of the games which he gave as curule aedile (65), and by his lavish expenditure upon the improvement of the Appian Way. But these measures were with him only means to the further end of creating for himself a position such as that which Pompey had already won; and this ulterior aim he pursued with an audacious indifference to constitutional forms and usages. His coalition with Crassus, soon after Pompey's departure, secured him an ally whose colossal wealth and wide financial connexions were of inestimable value, and whose vanity and inferiority of intellect rendered him a willing tool. The story of his attempted coup d'état in January 65 is probably false, but it is evident that by the beginning of 63 he was bent on reaping the reward of his exertions by obtaining from the people an extraordinary command abroad, which should secure his position before Pompey's return; and the agrarian law proposed early that year by the tribune P. Servilius Rullus had for its object the creation, in favour of Caesar and Crassus, of a commission with powers so wide as to place its members almost on a level with Pompey himself. It was at this moment when all seemed going well, that Caesar's hopes were dashed to the ground by Catiline's desperate outbreak, which not only discredited every one connected with the popular party, but directed the suspicions of the well-to-do classes against Caesar himself, as a possible accomplice in Catiline's revolutionary schemes.

The same wave of indignation and suspicion which for the moment checked Caesar's rise carried Marcus Tullius Cicero to the height of his fortunes. Cicero, as a politician, has been equally marked and reeved. That he was deficient in courage, that he was vain, and that he attempted the impossible, may be admitted at once. But he was neither a brilliant and unscrupulous adventurer nor an aimless trimmer, nor yet a devoted champion merely of senatorial

---

1 The exact provisions of Pompey's law are nowhere given: Livy, Epit. xxvii., "tribuniciam postestatem restituerunt." Cf. Vell. iii. 30. A lex Aeridia, in 75, had already repealed the law depriving the praetor of the lex Aeridia with a further provision: Cic. Corn. i.r. 28 Manlius gave him all and more than all that he expected (see Pompey). By the former he obtained the sole command for three years against the Mediterranean pirates. He was to have supreme authority over all Roman magistrates in the provinces throughout the Mediterranean and over the coasts for 50 miles inland. Fifteen legati, all of praetorian rank, were assigned to him, with two hundred ships, and as many troops as he thought desirable. The Manilian law transferred from Lucullus and Gabrio to Pompey the conduct of the Mithradatic War in Asia, and with it the entire control of Roman policy and interests in the East. The republican character of the position thus granted to Pompey, and the dangers of the precedent established, were clearly enough pointed out by such moderate men as Q. Lutatius Catulus, the "father of the senate," and by the orator Hortensius—but in vain. Both laws were supported, not only by the tribunes and the populace, but by the whole influence of the publicani and negotiatores, who considered the state of things as a great improvement.

6 See Pompey and Mithradates.

7 For his early life, see Caesar.

8 The story is so told by Suetonius, Jul. 6. In Sallust, Cat. 18, it appears as an intrigue originating with Catiline, and Caesar's name is omitted.

9 Cic. Agr. ii. 6, 15, "nihil aliud actu nisi um decem regem constituerentur."
ascendancy. He was a representative man, with a numerous following, and a policy which was naturally suggested to him by the circumstances of his birth, connections and profession, and which, impracticable as it proved to be, was yet consistent, intelligible and high-minded. Born at Arpinum, he cherished like all Apianates the memory of his great fellow-townsmen Marius, the friend of the Italians, the saviour of Italy and the irreconcilable foe of Sulla and the nobles. A "municipal" himself, his chosen friends and his warmest supporters were found among the well-to-do classes in the Italian towns. Unpopular with the Roman aristocracy, who despised him as a _peregrinus_, and with the Roman populace, he was the trusted leader of the Italian middle class, "the true Roman people," as he proudly styles them. It was they who carried his election for the consulship (63), who in 58 insisted on his recall from exile, and it was his influence with them which made Caesar so anxious to win him over in 49. He represented their antipathy alike to socialistic schemes and to aristocratic exclusiveness, and their old-fashioned simplicity of life in contrast with the cosmopolitan luxury of the capital.

By birth, too, he belonged to the equestrian order, the foremost representatives of which were indeed still the _publicani_ and _negotiatores_, but which since the enfranchisement of Italy included also the substantial burgesses of the Italian towns and the "squires" of the country districts. With them, too, Cicero was at one in their dread of democratic excesses and their social and political jealousy of the nobles. Lastly, as a lawyer and a scholar, he was passionately attached to the ancient constitution. His political ideal was the natural outcome of these circumstances. He advocated the maintenance of the old constitution, but not as it was understood by the extreme politicians of the right and left. The senate was to be the supreme directing council, but the senate of Cicero's dreams was not an oligarchic assemblage of nobles, but a body freely open to all citizens, and representing the worth of the community. The magistrates, while deferent to the senate's authority, were to be at once vigorous and public-spirited; and the assembly itself which elected the magistrates and passed the laws was to consist, not of the "mob of the forum," but of the true Roman people throughout Italy. For the realization of this ideal he looked, above all things, to the establishment of cordial relations between the senate and nobles in Rome and the great middle class of Italy represented by the equestrian order, between the capital and the country towns and districts. This was the _concordia ordinum_, the _consensus Italice_, for which he longed.

Cicero's election to the consulship for 63 over the heads of Caesar's nominees, Antonius and Catiline, was mainly the work of the Italian middle class, already rendered uneasy both by the rumours which were rife of revolutionary schemes and of Caesar's boundless ambition, and by the numerous disquieting signs of disturbance noticeable in Italy. The new consul vigorously set himself to discharge the trust placed in him. He defeated the insidious proposals of Rullus for Caesar's agrarianization and assisted in quashing the prosecution of Gaius Rabirius (q.t.). But with the consular elections in the autumn of 63 a fresh danger arose from a different quarter. The "conspiracy of Catiline" (see Catiline) was not the work of the popular party, and still less was it an unselfish attempt at reform; Catiline himself was a patrician, who had held high office, and possessed considerable ability and courage; but he was bankrupt in character and in purse, and two successive defeats in the consular elections had rendered him desperate. To retrieve his broken fortunes by violence was a course which was only too readily suggested by the history of the last forty years, and materials for a conflagration abounded on all sides. The danger to be feared from his intrigues lay in the state of Italy, which made a revolt against society and the established government only too likely if once a leader presented himself, and it was such a revolt that Catiline endeavoured to organize. Bankrupt nobles like himself, Sullan veterans and the starving peasants whom they had dispossessed of their holdings, outlaws of every description, the slave population of Rome, and the wilder herdsmen-slaves of the Apulian pastures, were all enlisted under his banner, and attempts were even made to excite disaffection among the newly conquered people of southern Gaul and the warlike tribes who still cherished the memory of Sertorius in Spain. In Etruria, the seat and centre of agrarian distress and discontent, a rising actually took place headed by a Sullan centurion, but the spread of the revolt was checked by Cicero's vigorous measures.

Catiline fled from Rome, and died fighting at a desperate counter-attack of his motley force of old soldiers and peasants and slaves. His accomplices in Rome were arrested, and, after an unavailing protest from Caesar, the senate authorized the consuls summarily to put them to death.

The Catilinarian outbreak had been a blow to Caesar, whose schemes it interrupted, but to Cicero it brought not only popularity and honour, but, as he believed, the realization of his political ideal. But Pompey was now on his way home, and again in 70 the political future seemed to depend on the attitude which the successful general would assume; Pompey himself looked simply to the attainment of the help of one political party or another of his immediate aims, which at present were the ratification of his arrangements in Asia and a grant of land for his troops. It was the impracticable jealousies of his personal rivals in the senate, aided by the versatility of Caesar, who presented himself not as his rival but as his ally, which drove Pompey once more, in spite of Cicero's efforts, into the camp of what was still nominally the popular party. In 60, on Caesar's return from his propraetorship in Spain, the coalition was formed, which is known by the somewhat confusing title of the First Triumvirate. Pompey was ostensibly the head of this new alliance, and in return for the satisfaction of his own demands he undertook to support Caesar's candidacy for the consulship. The wealth and influence of Crassus were enlisted in the same cause, and the _publicani_ were secured by a promise of release from their burden for collecting the taxes of Asia. Cicero was under no illusions as to the significance of this coalition. It scattered to the winds his dreams of a stable and conservative republic. The year 59 saw the republic powerless in the hands of three citizens. Caesar as consul procured the ratification of Pompey's acts in Asia, granted to the _publicani_ the relief refused by the senate, and carried an agrarian law of the new type, which provided for the purchase of lands for allotment at the cost of the treasury and for the assignment of the rich _ager Campaniae_. But Caesar aimed at more than the carrying of laws in the teeth of the senate or any party victory in the forum. An important military command was essential to him. An obedient tribune, P. Vatinius, was found, and by the _lex Vatinia_ he was given for five years the command of Cisalpine Gaul and Illyricum, to which

1 Mommers is throughout unfair to Cicero, as also are Drumm and Professor Beesly. The best estimates of Cicero's political position are those given by Mr. Strachan-Davidson in his _Cicero_ (1949), and by Professor Tyrrell in his Introductions to his edition of Cicero's _Letters_.

2 See _Cic. Pro Sulla_, 7; _Sall. Cat._, 31, "inquilinus urbis Romae."

3 _Cic. Pro Quinctio_, 8, 31; _Pro Cluentio_, 46, 153.

4 _Cic. In Verr._, ii., 73; _De Pet. Cons._, i. He shared with them their dislike of Sulla, as the foe of their order; _Pro Cluentio_, 55, 61.

5 _De Legg._ iii., 12.

7 _Ad Att._ ii., 16.
was added by a decree of the senate Transalpine Gaul also. This command not only opened to him a great military career, but enabled him, as the master of the valley of the Po, to keep an effective watch on the course of affairs in Italy.

Early the next year the attack upon himself which Cicero had foreseen was made. P. Clodius (q.v.) as tribune brought forward a law enacting that any one who had put a Roman citizen to death without trial by the people should be interdicted from fire and water. Cicero, finding himself deserted even by Pompey, left Rome in a panic, and by a second Claudian law he was declared to be outlawed. With Caesar away in his province, and Cicero banished, Clodius was for the time master in Rome. But, as absolute as he was in the streets, and recklessly as he parodied the policy of the Gracchi by violent attacks on the senate, his tribunate merely illustrated the anarchy which now inevitably followed the withdrawal of a strong controlling hand. A reaction speedily followed. Pompey, bewildered and alarmed by Clodius's violence, at last bestirred himself. Cicero's recall was decreed by the senate, and early in August 57 in the comitia centuriata, to which his Italian supporters flocked in crowds, a law was passed revoking the sentence of outlawry passed upon him.

Intoxicated by the acclamations which greeted him, and encouraged by Pompey's support, and by the salutary effects of Clodius's excesses, Cicero's hopes rose high. With indefatigable energy he strove to reconstruct a solid constitutional party, but only to fail once more. Pompey was irritated by the hostility of a powerful section in the senate, who thwarted his desires for a fresh command and even encouraged Clodius in insulting the conqueror of the East. Caesar became alarmed at the reports which reached him that the repeal of his agrarian law was threatened and that the feeling against the coalition was growing in strength; and all he was anxious for was a renewal of his five years' command. He acted at once, and in the celebrated conference at Luca (56) the alliance of the three self-styled rulers of Rome was renewed. Cicero succumbed to the inevitable and withdrew in despair from public life.

Pompey and Crassus became consuls for 55. Caesar's command was renewed for another five years, and to each of his two allies important provinces were assigned for a similar period—Pompey receiving the two Spanias and Africa, and Crassus Syria. The coalition thus divided them the control of the empire. For the future the question was, how long the coalition itself would last. Its duration proved to be short. In 53 Crassus was defeated and slain by the Parthians at Carrhae, and in Rome the course of events slowly forced Pompey into an attitude of hostility to Caesar. The year 54 brought with it a renewal of the riotous anarchy which had disgraced Rome in 58. Conscious of its own helplessness, the senate, with the eager assent of all respectable citizens, dissuaded Pompey from leaving Italy; and he accordingly left his provinces to be governed by his legates. But the anarchy and confusion only grew worse, and even strict constitutionalists like Cicero talked of the necessity of investing Pompey with some extraordinary powers for the preservation of order. At last

2 Both laws were carried in the concilium plebis. The first merely reaffirmed the right of appeal, as the law of Ca. Gracchus had done. The second declared Cicero to be already by his own act in leaving Rome "interdicted from fire and water"—a procedure for which precedents could be quoted. Cicero was also within the letter of the law.
3 Cicero's speech Pro Sesto gives expression to these feelings; it contains a passionate appeal to all good citizens to rally round the old constitution. The acclamations of Sestius confirmed his hopes. See Sest. O. Q. 9; App. B. C. ii. 45.
4 Livy, Epit. cv.; Dio Cass. xxxix. 33. For Cicero's views, see Ep. ad Fam. i. 9; Ad Att. iv. 5.
5 A dictatorship was talked of in Rome; Plut. Pomp. 54; Cic. Ad Q. Fr. iii. 8. Cicero himself anticipated Augustus in the habit of a princeps civitatis sketched in a lost book of the De republica.

in 52 he was elected sole consul, and not only so, but his provincial command was prolonged for five years more, and fresh troops were assigned him. The rôle of "saviour of society" thus thrust upon Pompey was one which flattered his vanity, but it entailed consequences which it is probable he did not foresee, for it brought him into close alliance with the senate, and in the senate there was a powerful party who were resolved to force him into heading the attack they could not successfully make without him upon Caesar. It was known that the latter, whose command expired in March 49, but who in the ordinary course of things would not have been replaced by his successor until January 48, was anxious to be allowed to stand for his second consulsipship in the autumn of 49 without coming in person to Rome. His opponents in the senate were equally bent on bringing his command to an end at the legal time, and so obliging him to disband his troops and enter Italy. He therefore resolved to act as dictator, either to inform the people of his return, or, if he kept his command, on preventing his standing for the consulsipship. Through 51 and 50 the discussions in the senate and the negotiations with Caesar continued, but with no result. On 1st January 49 Caesar made a last offer of compromise. The senate replied by requiring him on pain of outlawry to disband his legions. Two tribunes who supported him were ejected from the senate-house, and the magistrates with Pompey were authorized to take measures to protect the republic. Caesar hesitated no longer; he crossed the Rubicon and invaded Italy. The rapidity of his advance astounded and bewildered his foes. Pompey, followed by the consuls, by the majority of the senate and a long train of nobles, abandoned Italy as untenable, and crossed into Greece. At the end of March Caesar entered Rome as the undisputed master of Italy. Four years later, after the final victory of Munda (45), he became the undisputed master of the Roman world.

The task which Caesar had to perform was no easy one. It came upon him suddenly; for there is no sufficient reason to believe that Caesar had long premeditated revolution, or that he had previously anything more than such a position as that which Pompey had already won, a position unreplicable indeed, but accepted by republicans as inevitable.־ War was forced upon him as the alternative to political suicide, but success in war brought the responsibilities of nearly absolute power, and Caesar's genius must be held to have shown itself in the mastery fashion in which he grasped the situation, rather than in the supposed sagacity with which he is said to have foreseen and prepared for it. In so far as he failed, his failure was mainly due to the fact that his tenure of power was too short for the work which he was required to perform. From the very first moment when Pompey's ignominious retreat left him master of Italy, he made it clear that he was neither a second Sulla nor even the reckless anarchit which many believed him to be. The Roman and Italian public were written about this time, which was based upon his hopes of what Pompey might prove to be; Ad Att. viii. 11; August. De civ. Dei, v. 13.

Pompey was the great defender of the rights of the East; Plut. Pomp. 54; App. B. C. ii. 24.

For the reasons of its authorship, see Cicero's letter to Brutus.

1 For the Civil Wars, see Caesar; Cicero; and Pompey.

2 On this, as on many other points connected with Caesar, divergence has here been ventured on from the views expressed by Mommsen in his brilliant chapter on Caesar (Hist. of Rome, bk. v. cap. xi.). Too much stress must not be laid on the gossip related by Suetonius as to Caesar's early intentions.

3 Cicero vividly expresses the revulsion of feeling produced by Caesar's energy, humanity, and moderation on his first appearance in Italy. Compare Ad Att. vii. 11, with Ad Att. viii. 13.
developing the policy implied in the Gabiniun and Manilian laws, and the precedent he established was closely followed by his successors. It was otherwise with the more difficult question of the form under which this new executive authority should be exercised and the relation it should hold to the republican constitution. We must be content to remain in ignorance of the precise shape which Caesar intended ultimately to give to the new system. The theory that he contemplated a revival of the old Roman kingship is supported by little more than the popular gossip of the day, and the form under which he actually wielded his authority can hardly have been regarded by so sagacious a statesman as more than a provisional arrangement. This form was that of the dictatorship; and in favour of the choice it might have been urged that the dictatorship was the office naturally marked out by republican tradition as the one best suited to carry the state safely through a serious crisis, that the powers it conveyed were, wide, that it was as dictatorial as Sulla had reorganized the state, and that a dictatorship was the political form most effective in the enforcement of laws which it was desirable to have carried into effect. The "perpetual dictatorship" granted him after his victory at Munda (45) was a contradiction in terms, and a repudiation of constitutional government which excited the bitterest animosity. 

A second question, hardly less important, was that of the position to be assigned to the old constitution. So far as Caesar himself was concerned, the answer was for the time sufficiently clear. The old constitution was not formally abrogated. The senate met and deliberated; the laws which Caesar had passed were read once more in the forum; the ancient praetors, aediles, quaestors and tribunes; and Caesar himself, like his successors, professed to hold his authority by the will of the people. But senate, assembly and magistrates were all alike subordinated to the paramount authority of the dictator; and this subordination was, in appearance at least, more direct and complete under the rule of Caesar than under that of Augustus. Caesar was by nature as impatient as Augustus was tolerant of established forms; and, dazzled by the splendour of his career of victory, and by his ubiquitous energy and versatility, the Roman public, high and low, prospected themselves before him and heaped honours upon him with a reckless profusion which made the existence of any authority by the side of his own an absurdity. Hence under Caesar the old constitution was repeatedly disregarded, or suspended in a way which contrasted unfavourably with the more respectful attitude assumed by Augustus for most of the time. Rome was left without any regular magistrates, and was governed like a subject town by Caesar's prefects. At another time a tribune was seen exercising authority outside the city bounds and invested with the imperium of a praetor. At the elections, candidates appeared before the people backed by a written recommendation from the dictator, which was equivalent to a command. Finally, the senate itself was

---

12 See Mommsen, Hist. of Rome, v. 333, and Ranke, Weltgeschichte, ii. 319 seq. According to Appian ii. 102, and Plutarch, Caes. 64, the title rex was only to be used abroad in the East, as likely to strengthen Caesar's position against the Parthians.
13 Cicero, Phil. i. 2, 4, praises Antony, "quum dictatoris nomen in imperiis perpetuo dictaturae recentem memoria memoranium et rex republica sustulisset.
14 For the long list of these, see Appian ii. 106; Dio xliii. 43-45; Plut. Cat. 57; Suet. Jul. 76. Cf. also Mommsen, Hist. of Rome, x. 30, in his, War Letters, App. i.; Zumpt, Studia Romana, 199 seq. (Berlin, 1659).
16 Cic. Ad Att. x. 8.
17 Suet. Jul. 41, "Caesar dictator ... commendo vobis illum et illum ut vestro suffragio suae dignitatem tenente."
transformed out of all likeness to its former self by the raising of its numbers to 900, and by the admission of old soldiers, sons of freedmen and even "semi-barbarous Gauls." But, though Caesar's high-handed conduct in this respect was not imitated by his immediate successors, yet the main lines of their policy were laid down by him. These were—(1) the municipal organization of the old republican constitution, and (2) its subordination to the paramount authority of the master of the legions and the provinces. In the first case he only carried further a change already in progress. Of late years the Senate had been rapidly losing its hold over the Empire at large. Even the ordinary proconsuls were virtually independent potentates, ruling their provinces as they chose, and disposing absolutely of legions which recognized no authority but theirs. The consuls and praetors of each year had since 81 been stationed in Rome, and immersed in purely municipal business; and, lastly, since the enfranchisement of Italy, the comitia, though still recognized as the ultimate source of all authority, had become little more than assemblies of the city populace, and their claim to represent the true Roman people was indignantly questioned, even by republicans like Cicero. The concentration in Caesar's hands of all authority outside Rome completely and finally severed all real connexion between the old institutions of the Republic of Rome and the government of the Roman Empire. But the institutions of the Republic not merely became, what they had originally been, the local institutions of the city of Rome; they were also subordinated even within these narrow limits to the paramount authority of the man who held in his hands the army and the provinces. Autocratic abroad, at home he was the chief magistrate of the commonwealth; and this position was marked, in his case as in that of those who followed him, by a combination in his person of various powers, and by a general right of precedence which left no limits to his authority but such as he chose to impose upon himself. During the greater part of his reign he was consul as well as dictator. In 48, after his victory at Pharsalia, he was given the tribunicia potestas for life, and after his second success at Thapsus the praefectura morum for three years. As chief magistrate he convenes and presides in the Senate, nominales candidates, conducts elections, carries laws in the assembly and administers justice in court. Finally, as a reminder that the chief magistrate of Rome was also the autocratic ruler of the Empire, he wore even in Rome the laurel wreath and triumphal dress, and carried the sceptre of the victorious emperor.

Nor are we without some clue as to the policy which Caesar had sketched out for himself in the administration of the Empire, the government of which he had centralized in his own hands. The much-needed work of rectifying the frontiers he was forced, by his premature death, to leave to other hands, but within the frontiers he anticipated Augustus in lightening the financial burden of the provincials, and in establishing a stricter control over the provincial governors, while he went beyond him in his desire to consolidate the Empire by extending the Roman franchise and admitting provincials to a share in the government. He completed the Romanization of Italy by his enfranchisement of the Transpadane Gauls, and by establishing throughout the peninsula a uniform system of municipal government, which under his successors was gradually extended to the provinces. 1

7 He limited the term of command to two years in consul and one year in praetorian provinces; Cicero, Phil. i. 8, 19; Dio xliii. 25. 8 Suet. Jul. 42; Cic. Ad. Att. xiv. 12.
9 Lex Julia municipalis; see CAESAR.

On the eve of his departure for the East, to avenge the death of Crassus and humble the power of Parthia, Caesar fell a victim to the wounded pride of the republican nobles; and between the day of his death (March 15, 44) and that on which Octavian defeated Antony at Actium (September 2, 31) lies a dreary period of anarchy and bloodshed. 13

For a moment, in spite of the menacing attitude of Caesar's self-constituted representative Marcus Antonius (Mark Antony), it seemed to one man at least as if the restoration of republican government was possible. With indefatigable energy Cicero strove to enlist the Senate, the people, and above all the provincial governors in support of the old constitution. But, though his eloquence now and again carried all before it in senate-house and forum, it was powerless to alter the course of events. By the beginning of 43 civil war had recommenced; in the autumn Antony was already threatening an invasion of Italy at the head of seventeen legions. Towards the end of October Antony and his ally M. Aemilius Lepidus coalesced with the young Octavian, who had recently been elected consul at the age of twenty, in spite of senatorial opposition; and the coalition was legitimated by the creation of the "Second Triumvirate," a combination of the "Three of the Principalities," and the government of the commonwealth 18 known as the "Second Triumvirate." It was appointed for a period of five years, and was continued in 37 for five years more. 14 The rule of the triumvirs was inaugurated in the Sullan fashion by a proscription, foremost among the victims of which was Cicero himself. In the next year the defeat of M. Junius Brutus and C. Cassius Longinus at Philippi, by the combined forces of Octavian and Antony, destroyed the last hopes of the republican party. In 40 a threatened rupture between the two victors was avoided by the treaty concluded at Brundisium. Antony married Octavian's sister Octavia, and took command of the eastern half of the empire; Octavian appropriated Italy and the West; while Lepidus was forced to content himself with Africa. 16 For the next twelve years, while Antony was indulging in dreams of founding for himself and Cleopatra an empire in the East, and shocking Roman feeling by his wild excesses and his affectation of oriental magnificence, 17 Octavian was patiently consolidating his power. Lepidus his fellow-triumvir was in 36 ejected from Africa; and when he was destroyed 18, 19, 20 he had since his defeat at Munda maintained a semi-piratical ascendancy in the western Mediterranean, was decisively defeated in the same year, and his death in 35 left Octavian sole master of the West. The inevitable trial of strength between himself and Antony was not long delayed. In 32 Antony openly challenged the hostility of Octavian by divorcing Octavia in favour of the beautiful and daring Egyptian princess, with whom, as the heiress of the Ptolemies, he aspired to share the empire of the Eastern world. By a decree of the Senate Antony was declared deposed from his command, and war was declared against Queen Cleopatra. 20 On the 2nd of September 31 was fought the battle of Actium. 21 Octavian's victory was complete. Antony and Cleopatra committed suicide (30), and the Eastern provinces submitted in 29. Octavian returned to Rome to celebrate his triumph and mark the end of the long-continued anarchy.

by closing the temple of Janus;1 at the end of the next
year he formally laid down the extraordinary powers which
he had held since 43, and a regular government was
established.

III. The Empire.

PERIOD I. THE PRINCIPATE, 27 B.C.-A.D. 284—(a) The
Constitution of the Principate.—The conqueror of Antinous at
Actium, the great-nephew and heir of the dictator Caesar, was
now summoned, by the general consent of a world wearied out
with twenty years of war and anarchy,2 to the task of establish-
ing a government which should as far as possible respect the
forms and traditions of the Republic, without sacrificing that
centralization of authority which experience had shown to be
necessary for the integrity and stability of the Empire. It was
a task for which Octavian was admirably fitted. To great
administrative capacity and a quiet tenacity of purpose he
united deliberate caution and unflaking tact; while his bourgeois
birth and genuinely Italian sympathies enabled him to win
the confidence of the Roman community to an extent impos-
sible for Caesar, with his dazzling pre-eminence of patrician
descent, his daring disregard of forms and his cosmopolitan
tastes.

The new system which was formally inaugurated by Octavian
in 28-27 B.C.3 assumed the shape of a restoration of the republic
under the leadership of a princeps.4 Octavian voluntarily
resigned the extraordinary powers which he had
held since 43, and, to quote his own words, "handed
over to the republic to the control of the senate and
people of Rome."5 The old constitutional machinery
was once more set in motion; the senate, assembly and magis-
trates resumed their functions; and Octavian himself was
hailed as the "restorer of the commonwealth and the champion
of freedom."6 It was not so easy to determine what relation
he himself, the actual master of the Roman world, should occupy
towards this revived republic. His abdication, in any real
sense of the word, would have simply thrown everything back
into confusion. The interests of peace and order required that
he should retain at least the substantial part of his authority;7
and this object was in fact accomplished, and the rule of the
emperors founded, in a manner which has no parallel in history.

Any revival of the kingly title was out of the question, and
Octavian himself expressly refused the dictatorship.8 Nor was
any new office created or any new official title invented for his
benefit. But by senate and people he was invested according
to the old constitutional forms with certain powers, as many
citizens had been before him, and so took his place by the side
of the lawfully appointed magistrates of the republic;—only,
to mark his pre-eminent dignity, as the first of them all, the
senate decreed that he should take as an additional cognomen
that of "Augustus,"9 while in common parlance he was hence-
forth styled princeps, a simple title of courtesy, familiar to re-
publican usage, and conveying no other idea than that of a

14 Mom. Anc. vi. 16, 21-23.
division of authority between the republic and its chief magistrate became increasingly unequal. Over the provinces the princeps from the first ruled autocratically; and this autocracy reacted upon his position in Rome, so that it became every year more difficult for a ruler so absolute abroad to maintain even the fiction of republican government at home. The republican institutions, with the partial exception of the senate, lose all semblance of authority outside Rome, and even as the municipal institutions of the chief city of the empire they retain but little actual power. The real government of Rome passes gradually into the hands of imperial prefects and commissioners, and the old magistracies become merely decorations which the emperor bestows at his pleasure. At the same time the rule of the princeps assumes an increasingly personal character, and the whole work of government is silently concentrated in his hands and in those of his own subordinates. Closely connected with this change is the different aspect presented by the history of the empire in Rome and Italy on the one hand and in the provinces on the other. Rome and Italy share in the decline of the republic. Political independence and activity die out; their old pre-eminence and exclusive privileges gradually disappear; and at the same time the weight of the overwhelming power of the princeps, and the abuses of their power by individual princeps, press most heavily upon them. On the other hand, in the provinces and on the frontiers, where the imperial system was most needed, and where from the first it had full play, it is seen at its best as developing or protecting an orderly civilization and maintaining the peace of the world.

The decay of the republican institutions had commenced before the revolutionary crisis of 49. It was accelerated by the virtual suspension of regular government between 49 and 28; and not even the diplomatic deference towards ancient forms which Augustus displayed availed to conceal the unreality of his work of restoration. The comitia received back from him their ancient rights (Suet. Aug. 40), and during his lifetime they continued to pass laws and to elect magistrates. But after the end of the reign of Tiberius we have only two instances of legislation by the assembly in the ordinary way, and the law-making of the empire is performed either by decrees of the senate or by imperial edicts and constitutions. Their prerogative of electing magistrates was, even under Augustus, robbed of most of its importance by the control which the princeps exercised over their choice by means of his rights of nomination and commendation, which effectually secured the election of his own nominees. By Tiberius this restricted prerogative was still further curtailed. The candidates for all magistracies except the consulship were henceforward nominated and voted for in the senate-house and by the senators, and only the formal return of the result (renuntiatio) took place in the assembly (Dio Ixvi. 20). And, though the election of consuls was never thus transferred to the senate, the process of voting seems to have been silently abandoned. In the time of the younger Pliny we hear only of the nomination of the candidates and of their formal renuntiatio in the Campus Martius. The princeps himself as long as the Princepate lasted, continued to receive the tribunicia potestas by a vote of the assembly, and was thus held to derive his authority from the people.

Changes in the constitution of the princeps.

The plebeia of Claudius, Tac. Ann. xi. 13, 14, and the lex agraria of Nerva; Digest, xxi. 21, 3; Dio Ixvi. 2; Plin. Ep. vii. 19.

On these rights, the latter of which was not exercised in the case of the consulship until the close of Nero's reign, see Mommsen, Staatsr. ii. 916-28; Tac. Ann. i. 14, 15, 81; Suet. Aug. 56; Dio Ixvi. 20.

Tac. Ann. i. 15, "comitia et campo ad patres transita sunt"; compare Ann. xiv. 28. The magistracy directly referred to is the praetorship, but that the change affected the lower magistracies also is certain; see, e.g., Pliny's Letters, passim, especially ii. 20, vii. 19.

Plin. Paneg. 92.

Gaius i. 5, "cum ipse imperator per legem imperium accepit."
This almost complete effacement of the comitia was largely due to the fact that they had ceased to represent anything but the populace of Rome, and the comparatively greater vitality shown by the old magistrates is mainly attributable to the value they continued to possess in the eyes of the Roman upper class. But, though they were eagerly sought (Plin. Epp. ii. 9, vi. 6), and conferred on their holders considerable social distinction, the magistrates ceased, except in name, to be the popularly chosen executive officers of the Roman state. In the administration of the empire at large they had no share, if we except the subordinate duties still assigned to the quaestor in a province. In Rome, to which their sphere of work was limited, they were overshadowed by the dominant authority of the princesps, while their range of duties was increasingly circumscribed by the gradual transference of administrative authority, even within the city, to the emperor and his subordinate officials. And their dependence on the princesps was confirmed by the control he exercised over their appointment. For all candidates the approval, if not the nomination, of the princesps became the indispensable condition of success, and the princesps on his side treated these ancient offices as pieces of preferment with which to reward his adherents or gratify the ambition of Roman nobles. The dignity of the office, too, was impaired by the practice, begun by Caesar and continued by Augustus and his successors, of granting the insignia to men who had not held the actual magistracy itself. The consulship was still the highest post open to the private citizen, and consular rank a necessary qualification for high office in the provinces; but the actual consuls have scarcely any other duties than those of presiding in the senate and occasionally executing its decrees, while their term of office dwindles from a year to six and finally to two months. In the age of Tacitus and the younger Pliny, the contrast is striking between the high estimate set on the dignity of the office and the frankness with which its limited powers and its dependence on the emperor are acknowledged. The praetors continued to exercise their old jurisdiction with little formal change down to at least the latter half of the second century, but only as subordinate to the higher judicial authority of the emperor. The aediles retained only such petty police duties as did not pass to one or another of the imperial prefects and commissioners. The tribunatu: fared still worse, for, by the side of the tribunica potestas wielded by the princesps, it sank into insignificance. The quaestorship suffered less change than any other of the old offices. It kept its place as the first step on the ladder of promotion, and there was still a quaestor attached to each governor of a senatorial province, to the consuls in Rome, and to the princesps himself.

The Senate.

The Senate was the single permanent organ of government in the empire. In the time of Augustus it consisted of the holders of the old curule magistracies; it was not increased until the end of the first century, when the power of the princeps was so much enhanced as to make it desirable to supplement his authority by some body of lower importance. The senators were a minority of the whole population of Rome and Italy; they were drawn from the families of the older nobility, and as such were destined to become the holders of the highest offices in the state. The Senate was a closed body, and could not be augmented by the admission of any who were not the sons of senators. Its principal functions were to deliberate on the great public questions that were submitted to it, and to dispose of the business of the state that was brought before it. The Senate had no power of initiative or decision; it could only deliberate and act according to the orders of the princeps. In the time of Augustus, however, the Senate played an important part in the affairs of the empire. It was consulted on all important matters, and its advice was often followed. It had the power of impeaching and deposing officials, and it also had the power of trying cases of treason and other crimes. The Senate was the only body of which the princeps was not a member, and it was the only body that could question his authority.

2. For a consular senatorial province and for the more important of the imperial provinces, see the principesps in themselves, as e.g., in the administration of Italy and of the public provinces, whose governors
3. Mommsen, Staatsr., ii. 82 sqq. Six months was the usual term down to the death of Nero; we have then four or two months; in the 3rd century two was the rule. The consuls who entered on office on the 1st of January styled consules ordinarii, and gave their name to the year, whilst the others were distinguished as consules suffecti or minorores; Dio Cass. xlviii. 35.
4. Plin. Paneg. 92; Tac. Hist. i. 11, Agric. 44.
6. Plin. Epp. i. 23, "inane est umbra et sine bonore nomen." There are a few instances of the exercise of the tribunes of their power of interference within the senate; Tac. Ann. i. 77, vii. 47, xvi. 26; Plin. Epp. i. 13.
7. Mommsen, Staatsr., ii. 567-60. Pliny was himself "quaestor Caesarius," Epp. vii. 16.

9. See de imp. Vesp., C. I. i. 930; "Senatum habere, relacionem facere, remittere; Scta. per relationem discussionemque facere."
into the hands of the emperor. Even in Rome and Italy its control of the administration was gradually transferred to the province of the city, and after the reign of Hadrian to imperial officers (juridici) charged with the civil administration.\(^1\) The part still played by its decrees in the modification of Roman law has been dealt with elsewhere (see Senate), but it is clear that these decrees did little else than register the expressed wishes of the emperor and his personal advisers.

The process by which all authority became centralized in the hands of the princeps and in practice exercised by an organized bureaucracy\(^2\) was of necessity gradual; but it had its beginnings under Augustus, who formed the equestrian order (admission to which was henceforth granted only by him) into an imperial service, partly civil and partly military, whose members, being immediately dependent on the emperor, could be employed on tasks which it would have been impossible to assign to senators (see Equites). From this order were drawn the armies of "procurators"—the term was derived from the practice of the great business houses of Rome—who administered the imperial revenues and properties in all parts of the empire. Merit was rewarded by independent governorships such as those of Raetia and Noricum, or the command of a single legio such as "Maximian" and "Septimius"; and the prizes of the knight's career were the prefectures of the praetorian guard, the corn-supply and the city police, and the governorship of Egypt. The household offices and imperial secretariats were held by freedmen, almost always of Greek origin, whose influence became all-powerful under such emperors as Claudius.\(^3\) The financial secretary (a rationibus) and those who dealt with the emperor's correspondence (ob epistulis) and with petitions (a libellis) were the most important of these.

This increase of power was accompanied by a corresponding elevation of the princeps himself above the level of all other citizens. The comparatively modest household and simple life of Augustus were replaced by a more regal splendour, and under Nero we find all the outward accessories of monarchy present, the palace, the palace guards, the crowds of courtiers, and a court ceremonial. In direct opposition to the republican theory of the principate, members of the family of the princeps share the dignities of his position. The males bear the cognomina of Caesar, and are invested, as youths, with high office; their names and even the titles of the temples in which they were placed in the yearly prayers for the safety of the princeps;\(^4\) their birthdays are kept as festivals; the praetorian guards take the oath to them as well as to the princeps himself. The logical conclusion was reached in the practice of Caesar-worship,\(^5\) which was in origin the natural expression of a widespread sentiment of homage, which varied in form in different parts of the empire and in different classes of society, but was turned to account by the statecraft of Augustus to develop something like an imperial patriotism. The official worship of the deified Caesar, starting from that of the "divine Julius," gave a certain sanctity and continuity to the regular succession of the emperors, but it was of less importance politically than the worship of "Rome and Augustus," first instituted in Asia Minor in 29 B.C., and gradually diffused throughout the provinces, as a symbol of imperial unity. It must be observed that living emperors were not officially worshipped by Roman citizens; yet we find that even in Italy an unauthorized worship of Augustus sprang up during his lifetime in the country towns.  

On the accession of Augustus, there could be little doubt as to the nature of the work that was necessary, if peace and prosperity were to be secured for the Roman world. He was called upon to justify his position by rectifying the frontiers and strengthening their defences, by reforming the system of provincial government, and by reorganizing the finance; and his success in dealing with these three difficult problems is sufficiently proved by the prosperous condition of the empire for a century and a half after his death. To secure peace it was necessary to establish on all sides of the empire really defensible frontiers; and this became possible now that for the first time the direction of the foreign policy of the state and of its military forces was concentrated in the hands of a single magistrate. To the south and west the generals of the republic, and Caesar himself, had extended the authority of Rome to the natural boundaries formed by the African deserts and the Atlantic Ocean, and in these two directions Augustus's task was in the main confined to the organization of a settled Roman government within these limits. In Africa the client state of Egypt was ruled by Augustus as the successor of the Ptolemies, and administered by his deputies (profectus), and the kingdom of Numidia (25 B.C.) was incorporated with the old province of Africa. In Spain the hill-tribes of the north-west were finally subdued in a third war, and Lusitania was established.\(^6\) In Gaul Augustus (27 B.C.) established in addition to the "old province" the three new ones of Aquitania, Lugudunensis and Belgica, which included the territories conquered by Julius Caesar. Towards the north the republic had left the civilized countries bordering on the Mediterranean with only a very imperfect defence against the threatening mass of barbarian tribes beyond them. The result\(^7\) of Augustus's policy was to establish a protecting line of provinces running from the Euxine to the North Sea, and covering the peaceful districts to the south,—Moesia (A.D. 6), Pannonia (A.D. 9), Noricum (15 B.C.), Raetia (15 B.C.) and Gallia Belgica. Roman rule was thus carried up to the natural frontier lines of the Rhine and the Danube. It was originally intended to make the Elbe the frontier of the empire; but after the defeat of P. Quintilius Varus (A.D. 9) the forward policy was abandoned. Tiberius recalled Germanicus as soon as Varus had been avenged; and after the peace with Maroboduus, the chief of the Marcomanni on the upper Danube, in the next year (A.D. 17), the defensive policy recommended by Augustus was adopted along the whole of the northern frontiers of the empire, which was held by the imposing mass of troops. Along the Rhine lay the armies of Upper and Lower Germany, consisting of four legions each; eight more guarded the Danube and the frontiers of Pannonia and Moesia. At frequent intervals along the frontier were the military colonies, the permanent camps and the smaller intervening castella. Flotillas of galleys cruised up and down the rivers, and Roman roads opened communication both along the frontiers and with the seat of government in Italy.

In the East, Rome was confronted with a well-organized and powerful state whose claims to empire were second only to her own. The victory of Carrae (25 B.C.) had encouraged among the Parthians the idea of an invasion of Syria and Asia Minor, while it had awakened in Rome a genuine fear of the formidable power which had so suddenly arisen in the East. Caesar was at the moment of his death preparing to avenge the death of Crassus by an invasion of Parthia, and Antony's schemes of founding an Eastern empire which should rival that of Alexander included the conquest of the kingdom beyond the Euphrates. Augustus, however, adhered to the policy of the Senate and the Augustus: the "keeping of the empire within its bounds," and the Parthians, weakened by internal feuds and dynastic quarrels, were in no mood for vigorous action. Roman pride was satisfied by the restoration of the standards taken at Carrae. Four legions guarded the line of the Euphrates, and, beyond the frontiers of Pontus and

Cappadocia, Armenia was established as a "friendly and independent ally." Next in importance to the rectification and defence of the frontiers was the reformation of the administration, and the restoration of prosperity to the distracted and exhausted provinces. The most serious defect of the republican system had been the absence of any effective control over the Roman officials outside Italy. This was now supplied by the general praconsular authority vested in the emperor. The provinces were for the first time treated as departments of a single state, while their governors, from being independent and virtually irresponsible rulers, became the subordinate officials of a higher authority. Over the legali of the imperial provinces the control of the emperor was as complete as that of the republican proconsul over his staff in his own province. They were appointed by him, held office at his good pleasure, and were directly responsible to him for their conduct. The proconsuls of the senatorial provinces were in law magistrates equally with the princeps, though inferior to him in rank; it was to the senate that they were as of old responsible; they were still selected by lot among the senators of consular and praetorian rank. But the distinction did not seriously interfere with the paramount authority of the emperor. The provinces left nominally to the senate were the more peaceable and settled districts in the heart of the empire, where only the routine work of civil administration was needed, and where the local municipal governments were as yet comparatively vigorous. The senatorial proconsuls themselves were indirectly nominated by the emperor through his control of the praetorship and consulship. They wielded no military and only a strictly subordinate financial authority, and, though Augustus and Tiberius, at any rate, encouraged the fiction of the responsibility of the senatorial governors to the senate, it was in reality to the emperor that they looked for direction and advice, and to him that they were held accountable. Moreover, in the case of all governors this accountability became under the empire a reality. Prosecutions for extortion (de pecunia repelundis), which were now transferred to the hearing of the senate, are tolerably frequent during the first century of the empire; but a more effective check on maladministration lay in the appeal to Caesar from the decisions of any governor, which was open to every provincial, and in the right of petition. Finally, the authority both of the legate and the proconsul was weakened by the presence of the imperial procurator, to whom was entrusted the administration of the fiscal revenues; while both legate and proconsul were deprived of that right of requisitioning supplies which, in spite of a long series of restrictive laws, had been the most powerful instrument of oppression in the hands of republican governors.

The financial reforms of Augustus are marked by the same desire to establish an equitable, orderly and economical system, and by the same centralization of authority in the emperor's hands. The institution of an imperial census, or valuation, on all lands throughout the empire, and the substitution in this branch of the public revenue of a uniform system of assessment, in place of the heterogeneous and irregular payments made under the republic, were the work of Augustus, though the system was developed and perfected by the emperors of the 2nd century and by Diocletian. The land tax itself was directly collected, either by imperial officials or by local authorities responsible to them, and the old wasteful plan of selling the privilege of collection to publicani was henceforward applied only to such indirect taxes as the customs duties. The rate of the land tax was fixed by the emperor, and with him rested the power of remission even in senatorial provinces.

The effect of these reforms is clearly visible in the improved financial condition of the empire. Under the republic the treasury had been nearly always in difficulties, and the provinces exhausted and impoverished. Under the emperors, at least throughout the 1st century, in spite of a largely increased expenditure on the army, on public works, on shows and largesses, and on the machinery of government itself, the better emperors, such as Tiberius and Vespasian, were able to accumulate large sums, while the provinces show but few signs of distress. Moreover, while the republic had almost entirely neglected to develop the internal resources of the provinces, Augustus set the example of a liberal expenditure on public works, in the construction of harbours, roads and bridges, the reclamation of waste lands, and the erection of public buildings. The crippling restrictions which the republic had placed on freedom of intercourse and trade, even between the separate districts of a single province, disappeared under the empire. In the eyes of the republican statesmen the provinces were merely the estates of the Roman people, but from the reign of Augustus dates the gradual disappearance of the old pre-eminence of Rome and Italy. It was from the provinces that the legions were increasingly recruited; provincials rose to high rank as soldiers, statesmen and men of letters, and the methods of administration, formerly distinctive of the provinces, were adopted even in Rome and Italy. From Augustus himself, jealous as he was of the traditions and privileges of the ruling Roman people, date the rule of an imperial prefect in the city of Rome, the division of Italy into regions in the provincial, and the permanent quartering there of armed troops.

Augustus founded a dynasty which occupied the throne for more than half a century after his death. The first and by far the ablest of its members was Tiberius (A.D. 14–37). He was undoubtedly a capable and vigorous ruler, who enforced justice in the government of the provinces, maintained the integrity of the frontiers and husbanded the finances of the state, but he was generally unpopular in Roman society, and was painted as a cruel and odious tyrant. His successor, Gaius (A.D. 37–41), generally known as Caligula, was the slave of his wild caprices and uncontrolled passions, which issued in manifest insanity. He was followed by his uncle, Claudius (A.D. 41–54), whose personal uncouthness made him an object of derision to his contemporaries, but who was by no means devoid of statesmanlike faculties. His reign left an abiding mark on the history of the empire, for he carried forward its development on the lines intended by Augustus. Client-states were absorbed, southern Britain was conquered, the Romanization of the West received a powerful impulse, public works were executed in Rome and Italy, and the organization of the imperial bureaucracy made rapid strides. Nero (A.D. 54–68), the last of the Julio-Claudian line, has been handed down to posterity as the incarnation of monstrous vice and fantastic luxury. But his wild excesses scarcely affected the prosperity of the empire at large; the provinces were well governed, and the war with Parthia led to a compromise in the matter of Armenia which secured peace for half a century.
The fall of Nero and the extinction of the "progeny of the Caesars" was followed by a war of succession which revealed the military basis of the Principate and the weakness of the tie connecting the emperor with Rome. Galba, Otho, Vitellius and Vespasian represented in turn the legions of Spain, the household troops, the army of the Rhine, and a coalition of the armies of the Danube and the Euphrates; and all except Otho were already de facto emperors when they entered Rome. The final survivor in the struggle, Vespasian (A.D. 69-79), was a man of comparatively humble origin, and as the Principate ceased to possess the prestige of high descent it became imperatively necessary to remove, as far as possible, the anomalies of the office and to give it a legitimate and permanent form. Thus we find an elaborate and formal system of titles substituted for the personal names of the Julio-Claudian emperors, an increasing tendency to insist on the inherent prerogatives of the Principate (such as the censorial power), and an attempt to invest Caesarism with an hereditary character, either by natural descent or by adoption, while the worship of the Divi, or defunct Caesars, was made the basis of senatorial dignity and power. Vespasian and his sons (Titus, A.D. 79-81, Domitian, A.D. 81-96) began extinct on the murder of the last named, whose high-handed treatment of the senate earned him the name of a tyrant; his successor, Nerva (A.D. 96-98), opened the series of "adoptive" emperors (Trajan, A.D. 98-117, Hadrian, 117-38, Antoninus Pius, 138-61, Marcus Aurelius, 161-80) under whose rule the empire enjoyed a period of internal tranquillity and good government. Its boundaries were extended by the subjugation of northern Britain (by Agricola, A.D. 78-84; see BRITAIN, § ROMAN), by the annexation of the districts in the angle of the Rhine and Danube under the Flavian emperors, and by the conquest of Dacia (the modern Transylvania) under Trajan (completed in A.D. 106). Trajan also annexed Arabia Petraea and in his closing years invaded Parthia and formed provinces of Armenia, Mesopotamia and Assyria; but these conquests were surrendered by his successor, Hadrian, who set himself to the task of consolidating the empire and perfecting its defences. To him is due the system of military posted along the frontier fortifications such as the wall which protected northern Britain and the palisade which replaced the chain of forts established by the Flavian emperors from the Rhine to the Danube.1 The Flavian and Antonine emperors. The construction of these defences showed that the limit of expansion had been reached, and under M. Aurelius the tide began to turn. A great part of his reign was occupied with wars against the Marcomanni, Quadi, Sarmatians, &c., whose irruptions seriously threatened the security of Italy. Henceforth Rome never ceased to be on the offensive. Within the frontiers the levelling and unifying process commenced by Augustus had steadily proceeded. A tolerably uniform provincial system covered the whole area of the empire. The client states had by one or been reconstituted as provinces, and even the government of Italy had been in many respects assimilated to the provincial type. The municipal system had spread widely; the period from Vespasian to Aurelius witnessed the elevation to municipal rank of an immense number of communities, not only in the old provinces of the West, in Africa, Spain and Gaul, but in the newer provinces of the North, and along the line of the northern frontier; and everywhere under the influence of the central imperial authority there was an increasing uniformity in the form of the local constitutions, framed and granted as they all were by imperial edict.2 Throughout the empire, even in the extension of the Roman franchise, was preparing the way for the final act by which Caracalla assimilated the legal status of all free-born inhabitants of the empire,3 and in the west and north this was preceded and accompanied by the complete Romanizing of the people in language and civilization. Yet, in spite of the internal tranquillity and the good government which have made the age of the Antonines famous, we can detect signs of weakness. It was in this period that the centralization of authority in the hands of the princeps was completed; the "dual control" established by Augustus, which had been unequal enough in the 1st century, was now, though not formally abolished, systematically ignored in practice. The senate ceased to be an instrument of government, and became an imperial peerage, largely composed of men not qualified by election to the quaestorship but directly ennobled by the emperor.4 The restricted sphere of administration left by Augustus to the old magistrates was still further narrowed; their jurisdiction, for example, tended to pass into the hands of the new municipal governors appointed by Caesar—the prefects of the city and the prefect of the guards. The complete organization of Caesar's own administrative service, and its recognition as a state bureaucracy, was chiefly the work of Hadrian, who took the secretaryships out of the hands of freedmen and entrusted them to procurators of equestrian rank.5 All these changes, inevitable, and in some degree beneficial, as they were, brought with them the attendant evils of excessive centralization. Though these were hardly felt while the central authority was wielded by vigorous rulers, yet even under Trajan, Hadrian and the Antonines we notice a failure of strength in the empire as a whole, and a corresponding increase of pressure on the imperial government itself. The reforms of Augustus had given free play to powers still fresh and vigorous. The ceaseless labours of Hadrian were directed mainly to the careful husbanding of such strength as still remained, or to attempts at reviving it by the sheer force of imperial authority. Among the symptoms of incipient decline were the growing depopulation, especially of the central districts of the empire, the constant financial difficulties, the frequent change of the title and residence of the local governments in the provincial communities,6 and the increasing reluctance exhibited by all classes to undertake the now onerous burden of municipal office.

It is to such facts as these that we must look in passing a final judgment on the imperial government, which is admittedly seen in its best and most perfect form in the Antonine period. In our review of the conditions which brought about the fall of the Roman Republic, we saw that the collapse of the city-state made Caesarism inevitable, since the extension of federal and representative institutions to a world-empire lay beyond the horizon of ancient thought. The benefits which Caesarism conferred upon mankind are plain. In the first place, the Roman world, which had hitherto not been governed in the true sense of the word, but exploited in the interests of a dominant clique, now received an orderly and efficient government, under which the frightful ravages of misrule and civil strife were repaired. The financial resources of the empire, hitherto handled by the imperishable and, above all, trained administrators, to whose service the imperial office offered a carrière ouverte aux talents; many of these were Greeks, or half-Greek Orientals, whose business capacity formed an invaluable asset hitherto

5 Klio, xxvii. 1 ff. [Hirschfeld's Verwaltungsbemalen reference may be made to Liebenau, Die Laufbahn der Procuratoren (Jena, 1886), and Schürz, De mutatuibus in imperio Romano ordine ab imperatore Hadriano factis (Bonn, 1883).

7 This led to the appointment of the curatoribus and procuratores in the 2nd century. The younger Pliny was one of these imperial commissioners, and his correspondence with Trajan throws much light on the condition of the provinces.
neglected. Augustus caused an official survey of the empire to be made, and a scientific census of its resources was gradually carried out and from time to time revised; thus the balance of revenue and expenditure could be accurately estimated and adjusted, and financial stability was established. The system of tax-farming was gradually abolished and direct collection substituted; commerce was freed from vexatious restrictions, and large customs-districts were formed, on whose borders duties were levied for revenue only. The government took even more direct measures for the encouragement of industry and especially of agriculture. The most remarkable of these were the “alimentary” institutions, originally due to Nerva and developed by succeeding emperors. Capital was advanced at moderate rates of interest to Italian landowners on the security of their estates, and the profits of this system of land-banks were devoted to the maintenance and education of poor children. The foundation of colonies for time-expired soldiers, who received grants of land on their discharge, contributed something to the formation of a well-to-do agricultural class; and although the system was not successful in lower Italy, where economic decline could not be arrested, there can be no doubt that central and northern Italy, where the vine and olive flourished, received liberal benefits. As we shall see, those contributed by the Oriental religions, were insignificant. This new nationality grew in definition through the gradual disappearance of distinctions of language and manners, the assimilating influence of commercial and social intercourse, and the extinguishment of national jealousies and aspirations. But the cosmopolitan society thus formed was compacted of so many disparate elements that a common patriotism was hard to foster, and doubly hard when the autocratic system of government prevented men from aspiring to that true political distinction which is attainable only in a self-governing community. It is true that there was much good work to be done, and that much good work was done, in the service of the emperors; true, also, that the carrière ouverte aux talents was in large measure realized. Distinctions of race were slowly but steadily effaced by the grant of citizen rights to provincials and by the manumission of slaves; and the career open to the Romanized provincial or the liberated slave might culminate in the highest distinctions which the emperor could bestow. In the hierarchy of social order—the senate, equestrian, and plebeian—hands ascended as lowly and regularly from the lower grades to the higher; and the more enlightened of the emperors—especially Hadrian—made a genuine endeavour to give a due share in the work of government to the various subject races. But nothing could compensate for the lack of self-determination, and although during the first century and a half of imperial rule a flourishing local patriotism in some degree filled the place of the wider sentiment, this gradually sank into decay and became a pretext under cover of which the lower classes in the several communities took toll of their wealthier fellow-citizens in the shape of public works, largesses, amusements, &c., until the resources at the disposal of the rich ran dry, the communities themselves in many cases became insolvent, and the inexorable claims of the central government were satisfied only by the surrender of financial control to an imperial commissioner. Then the organs of civic life became atrophied, political interest died out, and the whole burden of administration, as well as that of defence, fell upon the shoulders of the bureaucracy, which proved unequal to the task.

In a world thus governed the individual was thrown more and more upon his own resources—the pursuit of wealth and pleasure, or the satisfaction of intellectual interests. Under the rule of the Caesars much was done for education. Julius Caesar bestowed Roman citizenship on “teachers of the liberal arts”; Vespasian endowed professorships of Greek and Latin oratory at Rome; 2 and later emperors, especially Antoninus Pius, extended the same benefits to the provinces. Local enterprise and munificence were also devoted to the cause of education; we learn from the correspondence of the younger Pliny that public schools were founded in the towns of northern Italy. But though there was a wide diffusion of knowledge culminating in Antonine period, no true intellectual energies in Augustus, it is true, gathered about him the most brilliant writers of his time, and the debut of the new monarchy coincided with the Golden Age of Roman literature; but this was of brief duration, and the beginning of the Christian era saw the triumph of classicism and the first steps in the decline which awaits all literary movements which look to the past rather than the future. Political oratory could not exist under an absolute ruler; public life furnished no inspiring theme to poet or historian; and literature became didactic or imitative, while rhetoric degenerated into declamation. It is true that for some time both literature and philosophy maintained an alliance with the old republican aristocracy and voiced the undercurrent of opposition to the empire; but both had ceased to be irreconcilable before the time of Hadrian. Under his rule classicism gave way to the archaism of which Fronto and Apuleius furnish the most notable examples, and which preferred Cato and Ennius to Cicero and Virgil. But this return to the past was not followed by any renewed creative energy. It was a confession of weakness and little more; and the widely diffused influence of the Antonine period, though outwardly brilliant, had no progressive energy and presented but a feeble resistance to the dissolving forces of barbarism.

To strike the balance of loss and gain in the field of morals is an exceedingly difficult task. The denunciations of the satirists, especially of Juvenal, might lead us to believe that an appalling state of depravity existed in the society of the early empire; but satirists notoriously paint in glaring colours for literary effect, and whatever may be said of the morality of Rome—which was probably no better and no worse than that of any cosmopolitan capital—there were sound and healthy elements in plenty amongst the population of Italy and the provinces. Doubtless the craving for amusement especially for the shows of the amphitheatre and the chariot-races of the circus—infected the idle masses of the populace in Rome and the larger towns, and was fostered by the policy of despotism, which always aims at securing cheap popularity with the proletariat; but the tendency of the time, not only in the higher ranks, but also amongst humbler folk, was towards a broader humanity and a more serious view of life and its problems. Greek philosophy, especially the Stoic system, in order to appeal to the practical Roman intelligence, found itself obliged to elaborate a rule of conduct, and in many

1 Provinces, i. p. 5.

2 Immense fortunes were accumulated under the early empire, especially by imperial freedmen, such as Pallas, who is said to have possessed the equivalent of £3,000,000 sterling; and there were instances of extravagant luxury, which was encouraged by Nero. But we are told that there was a return to simpler habits of life under the Flavian dynasty.

3 Quintilian occupied the chair of Latin rhetoric, and received the ornementa consularia.
households the philosopher, generally a Greek, played the part of a director of consciences. The influence of these doctrines is shown in the humane provisions of the civil law elaborated in the Antonine period, which did much to mitigate the lot of the slave and to smooth the process by which freedom might be attained. Above all, a religious movement which drew its motive power not from Greek philosophy, but from Oriental mysticism, carried the human race far from its old moorings, and culminated in the triumph of Christianity. All the Eastern cults—whether of Cybele, of Isis, of the Syrian Baalim or of the Persian Mithras—had this in common, that they promised to their adherents redemption from the curse of the flesh and a glorious immortality after death; and this fact gave them an irresistible attraction for the disillusioned and overburdened subjects of the emperors. The religion of Mithras, whose doctrines were specially suited to the military temperament, made its way wherever the armies of the empire were stationed, and seemed likely at one moment to become universal; but it was forced to yield to Christianity, which refused to tolerate any rival, faced the empire with a claim to absolute dominion in the spiritual sphere, and at length made that claim good (see Roman Religion; Mithras; Great Mother of the Gods).

Marcus Aurelius died in 180, and the reign of his worthless son, Commodus (A.D. 180–92), was followed by a century of war and disorder, during which nothing but the stern rule of soldier emperors saved the empire from dissolution. The first and ablest of these was Septimius Severus (193–211), whose claims were disputed by Clodius Albinus in the West, and by Pescennius Niger in the East; in these struggles rival Roman forces, for the first time since the accession of Vespasian, exhausted each other in civil war. Severus emphasized strongly the military character of the Principate; he abstained from seeking confirmation for his authority from the senate, and deprived that body of most of the share in the government which it still retained; he assumed the title of proconsul in Rome itself, made the prefect of the guard the viceroy of his authority, and heaped privileges upon the army, which, although they secured its entire devotion to his family, impaired its efficiency as a fighting force and thus weakened Rome in face of the barbarian invader. He succeeded in found ing a short-lived dynasty, which ended with the attempt of Maximinus, the last of the Severi (235–38), to restore the independence of the senate. This led to a military reaction, and the elevation of the brutal Maximinus, a Thracian peasant, to the throne. The disintegration of the empire was the natural result; for the various provincial armies put forward their commanders as claimants to the crown. A hundred ties bound them closely to the districts in which they were stationed; their permanent camps had grown into towns, they had families and farms; the unarmed provincials looked to them as their natural protectors, and were attached to them by bonds of intermarriage and by long intercourse. Now that they found themselves left to repel by their own efforts the invaders from without, they reasonably enough claimed the right to interfere in the central authority which was powerless to aid them, and to choose for themselves imperatores whom they knew and trusted. These "tyrants," as they were called when unsuccessful, sprang up in ever-increasing numbers, and weakened Rome's power of resistance to the new enemies who were threatening her frontiers—the Alamanni and Franks, who broke through the German lines in 236; the Goths, who crossed the Danube in 247, raided the Balkan provinces, and defeated and slew the emperor, Decius, in 251, and the restored Persian kingdom of the Sassanidae (see Persia), whose rulers laid claim to all the Asiatic possessions of Rome and in 260 captured Antioch and made the emperor, Valerian, a prisoner. During the reign of Gallienus, the son of Valerian (260–68), the empire reached its height. The central authority was paralysed; the Romanized districts beyond the Rhine were irrevocably lost; the Persians were threatening to overrun the Eastern provinces; the Goths had formed a fleet of 500 sail which harried Asia Minor and even Greece itself, where Athens, Corinth, Sparta and Argos were sacked; and the legions on the frontiers were left to repel the enemies of Rome as best they could. A provincial empire was established by M. Cassianus Latinius Postumus in Gaul and maintained by his successors, M. Pivonius Victorinus and C. Pius Esuvius Tetricus. Their authority was acknowledged, not only in Gaul and by the troops on the Rhine, but by the legions of Britain and Spain; and under Postumus at any rate (259–69) the existence of the Gallic Empire was justified by the repulse of the barbarians and by the restoration of peace and security to the provinces of Gaul. On the Danube, in Greece and in Asia Minor none of the "pretenders" enjoyed more than a passing success. In the Far East, the Syrian Odaenathus, prince of Palmyra (?), through officially only the viceroy of the East (ex Ptolemais), led the Goths and Persians; he drove the Persians out of Asia Minor and Syria, recovered Mesopotamia, and ruled Syria, Arabia, Armeni a, Cappadocia and Cilicia with all the independence of a sovereign. Odaenathus was murdered in 266. His young son Vaballathus (Wahab-allath) succeeded him in his titles, but the real power was vested in his widow Zenobia, under whom not only the greater part of Asia Minor but even the province of Egypt was forcibly added to the dominions governed by the Palmyrene prince, who ceased to acknowledge the supremacy of Rome. Gallienus was murdered at Milan in 268, and after the brief reign of Claudius II. (A.D. 268–70), who checked the advance of the Goths, Aurelian (270–75) restored unity to the distracted empire. Palmyra was destroyed and Zenobia led a prisoner to Rome (in 273) and in the next year the Gallic empire came to an end by the surrender of Tetricus. Aurelian, it is true, abandoned the province of Dacia, but the defences of the Danube were strengthened, and in 276 Probus repelled the Franks and Alamanni, who had been terrorizing the Rhine frontier for some forty years. Finally, Carus (282) recovered Armenia and Mesopotamia from the Persians and restored the frontier fixed by Septimius Severus.

Although any serious loss of territory had been avoided, the storms of the 3rd century had told with fatal effect upon the general condition of the empire. The "Roman peace" had vanished; not only the frontier territories, but the central districts of Greece, Asia Minor, and even Italy itself, had suffered from the ravages of war, and the fortification of Rome by Aurelian was a significant testimony to the altered condition of affairs. War, plague and famine had thinned the population and crippled the resources of the provinces. On all sides land was running waste, cities and towns were decaying, and commerce was paralysed. Only with the greatest difficulty were sufficient funds squeezed from the exhausted taxpayers to meet the increasing cost of the defence of the frontiers. The old established culture and civilization of the Mediterranean world rapidly declined, and the mixture of barbaric rudeness with Oriental pomp and luxury was marked by the rule of the better emperors, such as Aurelian, was typical of the general deterioration, which was accelerated by the growing practice of settling barbarians on lands within the empire and of admitting them freely to service in the Roman army.

1 The massacre of the slaves of Pedanius Secundus, who had been murdered by some person unknown (Tac. Ann. xiv. 42), was, it is true, decreed by the senate; but it was a highly unpopular act, and is chiefly significant as showing that the senatorial aristocracy was out of harmony with the spirit of the time.

3 The common soldier was now permitted to marry, and ceased to live in camp (Herodian iii. 8. 5).
The reforms of Diocletian and Constantine.

Augusti and Caesares.

In the new system the emperor was finally emancipated from all constitutional limitation and control and the last traces of its republican origin disappeared. The emperors from Diocletian onwards were autocrats in theory as well as in practice. This avowed despotism Diocletian, following in the steps of Aurelian, hedged round and made more than ever of the Orient, the diadem of the head, the robes of silk and gold, the replacement of the republican salvation of a fellow-citizen by the adorning prostration even of the highest in rank before their lord and master, were all significant marks of the new regime. In the hands of this absolute ruler was placed the entire control of an elaborate administrative machinery. Most of the old local and national distinctions, privileges and liberties which had once flourished within the empire had already disappeared under the levelling influence of imperial rule, and the process was now completed. Roman citizenship had, since the edict of Caracalla, ceased to be the privilege of a minority. Diocletian finally reduced Italy and Rome to the level of the provinces: the provincial land-tax and provincial government were introduced into Italy, while Rome ceased to be even in name the seat of imperial authority. Throughout the whole area of the empire a uniform system of administration was established, the control of which was centred in the imperial palace. Between the civil and military departments the separation was complete. At the head of the former were the praetorian prefects, next below them the vicarii, who had charge of the dioceses; below these again the governors of the separate provinces (praeses, rectores, consulares), under each of whom a host of minor officials. Parallel with this civil hierarchy was the series of military officers, from the magistri militum, the duxes, and comites downwards. In both there is the utmost possible subdivision and division of authority. The subdivision of provinces, begun by the emperors of the 2nd century, was systematically carried out by Diocletian, and each official, civil or military, was placed directly under the orders of a superior; thus a continuous chain of authority connected the emperor with the meanest official in his service.

There can be little doubt that on the whole these reforms prolonged the existence of the empire, by creating a machinery which enabled the stronger emperors to utilize effectively all its available resources, and which even to some extent made good the deficiencies of weaker rulers. But in many points they failed to attain their object. Diocletian's division of the imperial authority among colleagues, subject to the general control of the senior Augustus, was effectually discredited by the twenty years of almost constant conflict which followed his own abdication (305-23). Constantine's partition of the empire among his three sons was not more successful in ensuring tranquillity, and in the final division of the East and West between Valentian and Constantine (364) the essential principle of Diocletian's scheme, the maintenance of a single central authority, was abandoned. The "tyrants," the course of the 3rd century, was far from unknown in the 4th. The system, moreover, while it failed altogether to remove some of the existing evils, aggravated others. The already overburdened financial resources of the empire were strained still further by the increased expenditure necessitated by the substitution of four imperial courts for one, and by the multiplication in every direction of paid officials. The gigantic bureaucracy of the 4th century proved, in spite of its undoubted services, an intolerable weight upon the energies of the empire.

Diocletian and Maximian formally abdicated their high office in 305. Nineteen years later Constantine I., the Great, the sole survivor of six rival emperors, united the whole empire under his own rule. His reign of fourteen years was marked by two events of first-rate importance,—the recognition of Christianity as the religion of the

...the baptism of Constantine the Great...and his successors...the
imposed a check, which was in time to become a powerful one, on the imperial authority. The establishment of the new

Constanti

“City of Constantine” as a second Rome paved the way for the final separation of East and West by providing for the former for the first time with a suitable seat of government on the Bosphorus. The death of Constantine in 337 was followed, as the abdication of Diocletian had been, by the outbreak of quarrels among rival Caesars. Of the three sons of Constantine who in 337 divided the empire between them, Constantine the eldest fell in civil war against his brother Constans; Constans himself was, ten years afterwards, defeated and slain by Magnentius; and the latter in his turn was in 353 vanquished by Constantine’s only surviving son Constantius.

The

Thus for the second time the whole empire was united under the rule of a member of the house of Constantine. But in 355 Constantius granted the title of Caesar to his cousin Valentinian, who, with the momentary elevation of a tyrant, Silvanus, and still more the inroads of Franks and Alamanni, had excited alarm. But Julian’s successes during the next five years were such as to arouse the jealous fears of Constantius. In order to weaken his suspected rival the legions under Julian in Gaul were suddenly ordered to march eastward against the Persians (360). They refused; and when the order was repeated, replied by proclaiming Julian himself emperor and Augustus. Julian, with probably sincere reluctance, accepted the position, but the death of Constantius in 361 saved the empire from the threatened civil war. Julian’s attempted restoration of pagan and in especial of Hellenic worship had no more permanent effect than the war which he courageously waged against the multitudinous abuses which had grown up in the luxurious court of Constantius. But his vigorous administration in Gaul undoubtedly checked the barbarian advance across the Rhine, and postponed the loss of the Western provinces; on the contrary, his campaign in Persia, begun in his absence, was successful (363), and his successor, Jovian, immediately surrendered the territories beyond the Tigris won by Diocletian seventy years before. Jovian died on the 17th of February 364; and on the 26th of February Valentinian was acknowledged as emperor of the army at Nicaea. In obedience to the wish of the soldiers that he should associate a同志 with himself, he conferred the title of Augustus upon his brother Valens, and the division of the empire was at last effected.—Valentinian became emperor of the West, Valens of the East. Valentinian maintained the integrity of the empire until his death (375), which deprived the weaker Valens of a trusted counsellor and ally, and was followed by a serious crisis on the Danube. In 376 the Goths, hard pressed by their new foes from the eastward, the Huns, sought and obtained the protection of the Roman Empire. They were transported across the Danube and settled in Moesia, but, indignant at the treatment they received, they arose in arms against their protectors. In 378 at Adrianople Valens was defeated and killed, and the victorious Goths advanced eastward to the very walls of Constantinople. Once more, however, the danger passed away. The skill and tact of Theodosius, who had been proclaimed emperor of the East by Gratian, conciliated the Goths; they were granted an allowance, and in large numbers entered the service of the Roman emperor. The remaining years of Theodosius’s reign (382-95) were mainly engrossed by the duty of upholding the increasingly feeble authority of his Western colleague against the attacks of pretenders. Maximus, the murderer of Gratian (383), was at first recognized by Theodosius as Caesar, and left in undisputed command of Gaul, Spain and Britain; but, when in 386 he proceeded tooust Valentinian II. from Italy and Africa, Theodosius marched westward, crushed him, and installed Valentinian as emperor of the West. In the very next year, however, the murder of Valentinian (392) by Arbogast, a Frank, was followed by the appearance of a fresh tyrant in the person of Eugenius, a domestic officer and nominee of Arbogast himself. Once more Theodosius marched westward, and near Aquileia decisively defeated his opponents. But his victory was quickly followed by his own illness and death (395), and the fortunes of East and West passed into the care of his two sons Arcadius and Honorius.

(a) From the Death of Theodosius to the Extinction of the Western Empire. (395-476).

Divisio

Through more than a century from the accession of Diocletian the Roman Empire had succeeded in holding at bay the swarming hordes of the northern barbarians. But Gaul and Spain had been lost, as Dacia had been lost in the century before, and though the frontier lines of the Rhine and the Danube were still guarded by Roman forts and troops, there were signs in plenty that a catastrophe was at hand.

From all the writers who deal with the 4th century we have one long series of laments over the depression and misery of the provinces. To meet the increased expenditure necessary to maintain the legions, to pay the hosts of officials, and to keep up the luxurious splendour of the imperial courts, not only were the taxes raised in amount, but the most oppressive and inquisitorial methods were adopted in order to secure for the imperial treasury every penny that could be wrung from the wretched taxpayer. The results are seen in such pictures as that which the panegyrist Eumenius draws of the state of Gaul (366-12) under Constantine, in the accounts of the same province under Julian fifty years later, in those given by Zosimus early in the 5th century, and in the later descriptions of the 5th century of the very special taxation and the assessment and collection of the taxes. Among the graver symptoms of economic ruin were the decrease of population, which seriously diminished not only the number of taxpayers, but the supply of soldiers for the legions; the spread of infanticide; the increase of waste lands whose owners and cultivators had fled to escape the tax collector; the declining prosperity of the towns; and the constantly recurring riots and insurrections, both among starving peasants, as in Gaul, and in populous cities like Antioch. The distress was aggravated by the civil wars, by the rapacity of tyrants, such as Maxentius and Maximus, but above all by the raids of the barbarians, who seized every opportunity afforded by the dissensions or incapacity of the emperors to cross the frontiers and carry the lands of the provincials. Constantine (306-12), Julian (356-60) and Valentinian I. (364-75) had each to give a temporary breathing-space to Gaul by repelling the Franks and Alamanni. Britain was harassed by Picts and Scots from the north (367-70), while the Saxon pirates swept the northern seas and the coasts both of Britain and Gaul. On the Danube the Quadi, Sarmatians, and above all the Goths, poured at intervals into the provinces of Pannonia and Moesia, and penetrated to Macedon and Thrace. In the East, in addition to the constant border feud with Persia, we hear of ravages by the Isaurian mountaineers, and by a new enemy, the Saracens.

1 In especial against the overweening influence of the eunuchs, an influence at once greater and more pernicious than even that of the imperial freedmen in the days of ClaudioS.

8 Amm. Marc. xiv. 4.
Even more ominous of coming danger was the extent to which the European half of the empire was becoming barbarized. The policy which had been inaugurated by Augustus himself of settling barbarians within the frontiers had been taken up on a larger scale and in a more systematic way by the Illyrian emperors of the 3rd century, and was continued by their successors in the 4th. In Gaul, in the provinces south of the Danube, even in Macedon and Italy, large barbarian settlements had been made—Theodosius in particular distinguishing himself by his liberality in this respect. Nor did the barbarians admitted during the 4th century merely swell the class of half-servile coloni. On the contrary, they not only constituted to an increasing extent the strength of the imperial forces, but won their way in ever-growing numbers to posts of dignity and importance in the imperial service. Under Constantine the palace was crowded with Franks. Julian led Gothic troops against Persia, and the army with which Theodosius defeated the tyrant Maximus (388) contained large numbers of Huna, and Alans, as well as of Goths. The names of Arbogast, Stilicho and Rufinus are sufficient proof of the place held by barbarians near the emperor’s person and in the control of the provinces and legions of Rome: and the relations of Arbogast to his eminence for the purple, Eugenius, were an anticipation of those which existed between Ricimer and the emperors of the latter half of the 5th century.

It was by barbarians already settled within the empire that the first of the series of attacks which finally separated the western provinces from the empire and set up a barbaric ruler in Italy were made, and it was in men of barbarian birth that Rome found her ablest and most successful defenders. The Visigoths whom Alaric led into Italy had been settled south of the Danube as the allies of the empire since the accession of Theodosius. But, like the Germans of the days of Caesar, they wanted land for their own, and Alaric himself aspired to raise himself to the heights which had been reached before him by the Vandal Stilicho at Ravenna and the Goth Rufinus at Constantineople. The jealousy which existed between the rulers of the western and eastern empires furthered his plans. In the name of Arcadius, the emperor of the east, or at least with the connivance of Arcadius’s minister Rufinus, he occupied the province of Illyricum, and from there ravaged Greece, while according to the existing division of provinces, belonging to the western empire. Thence in 396 he retreated before Stilicho to Illyricum, with the command of which he was now formally invested by Arcadius; he thus gained a base of operations against Italy. In 400 he led his people, with their wives and families, their waggons and treasure, to seek lands for themselves south of the Alps. But in this first invasion he penetrated no farther than the plains of Lombardy, and after the desperate battle of Pollentia (402 or 403) he slowly withdrew from Italy, his retreat being hastened by the promises of gold freely made to him by the imperial government. Not until the autumn of 408 did Alaric again cross the Alps. Stilicho was dead; the barbarian troops in Honorius’s service had been provoked into joining Alaric by the anti-Teutonic policy of Honorius and his ministers, and Alaric marched unopposed to Rome. The payment of a heavy ransom, however, saved the city. Negotiations followed between Alaric and the court of Ravenna. Alaric’s demands were moderate, but Honorius would grant neither lands for his people nor the honourable post in the imperial service which he asked for himself. Once more Alaric sat down before Rome, and the citizens were forced to agree to his terms. Attalus, a Greek, the prefect of the city, was declared Augustus, and Alaric accepted the post of commander-in-chief. But after a few months Alaric formally deposed Attalus, on account of his incapacity, and renewed his offers to Honorius. Again they were declined, and Alaric marched to the siege and sack of Rome (410). His death followed hard on his capture of Rome. Two years later (412) his successor Ataulf led the Visigoths to find in Gaul the lands which Alaric had sought in Italy. It is characteristic of the anarchical condition of the west that Ataulf and his Goths should have fought for Honorius in Gaul against the tyrants, and in Spain against the Vandals, Suebi and Alani; and it was with the consent of Honorius that in 419 Wallia, who had followed Ataulf as king of the Visigoths, finally settled with his people in south-western Gaul and founded the Visigothic monarchy.

It was about the same period that the accomplished fact of the division of Spain between the three barbarian tribes of Vandals, Suebi and Alani was in a similar manner recognized by the paramount authority of the emperor of the west. These peoples had crossed the Rhine at the time when Alaric was making his first attempt on Italy. A portion of the host led by Radagaisus actually invaded Italy, but was cut to pieces by Stilicho near Florence (403); the rest pressed on through Gaul, crossed the Pyrenees, and entered the as yet untouched province of Spain.

Honorius died in 423. With the single exception of Britain, no province had yet formally broken loose from the empire. But over a great part of the west the authority of the emperors was now little more than nominal; throughout the major part of Gaul and in Spain the barbarians who had settled, and barbarian states were growing which recognized the supremacy of the emperor, but were in all essentials independent of his control.

The long reign of Valentinian III. (423–55) is marked by two events of first-rate importance—the conquest of Africa by the Vandals and the invasion of Gaul and Italy by Attila. The Vandal settlement in Africa was closely akin in its origin and results to those of the Visigoths and of the Vandals themselves in Gaul and Spain. Here, as there, the occasion was given by the jealous quarrels of powerful imperial ministers. The feud between Boniface, count of Africa, and Aëtius, the “master-general” or “count of Italy,” opened the way to Africa for the Vandal king Gaiseric (Genseric), as that between Stilicho and Rufinus had before set Alaric in motion westward, and as the quarrel between the tyrant Constantine and the minister Honorius had paved the way for the Vandals, Suebes and Alans into Spain. In this case, too, land-hunger was the impelling motive with the barbarian invader, and in Africa, as in Gaul and Spain, the invaders’ acquisitions were confirmed by the imperial authority which they still professed to recognize. In 429 Gaiseric, king of the Vandals, crossed with his warriors, their families and goods, to the province of Africa, hitherto almost untouched by the ravages of war. Thanks to the quarrels of Boniface and Aëtius, their task was an easy one. The province was quickly overrun. In 435 the Vandal conquest of Africa.

Death of Honorius, 423.

For the treatment of Rome by Alaric, see Hodgkin i. 798; Gibbon iii. 321 sqq.; Ranke iv. 246. Allowance must be made for the exaggerations of the ecclesiastical writers.

For these tyrants, see Freeman in the Eng. Hist. Rev. i. 53–86.

The capital of the new state was Tolosa (Toulouse).

Jung, Die Römischen Landschaften, 73 sqq.

For the connexion between his movement and those of Alaric and of the Vandals, see Hodgkin i. 711; Gibbon iii. 262 sqq.

The Roman troops were withdrawn from Britain by Constantine in 407; Mommsen, Chron. min. i. 455.

Hodgkin vol. ii. bk. iii. chap. ii.; Gibbon ii. 400 sqq.; Jung, 183.

The leading ancient authority is Procopius. See Ranke iv. (2) 285; Pepeaucord, Gesch. d. Vandal. Herrschaft in Africa.

Prosper 699; Ranke iv. (1) 282.
Eleven years later (451) Attila invaded Gaul, but this Hunnish movement was in a variety of ways different from those of the Visigoths and Vandals. Nearly a century had passed since the Huns first appeared in Europe, and drove the Goths to seek shelter within the Roman lines. Attila was now the ruler of a great empire in central and northern Europe and, in addition to his own Huns, the German tribes along the Rhine and Danube and far away to the north owned him as king. He confronted the Roman power as an equal; and, unlike the Gothic and Vandal chieftains, he treated with the emperors of east and west as an independent sovereign. His advance on Gaul and Italy threatened not the establishment of one more barbaric chieftain on Roman soil, but the subjugation of the civilized and Christian West to the rule of a heathen and semi-barbarous conqueror. But the Visigoths in Gaul, Christian and already half Romanized, rallied to the aid of the empire against a common foe. Attila, defeated at Châlons by Aëtius, withdrew into Pannonia (451). In the next year he overran Lombardy, but penetrated no farther south, and in 453 he died. With the murder of Valentinian III. (455) the western branch of the house of theodiszus came to an end, and the next twenty years witnessed the accession and deposition of nine emperors.

Under the three-months' rule of Maximus, the Vandals under Gaiseric invaded Italy and sacked Rome. From 456-72 the actual ruler of Italy was Ricimer, the Sueve. Of the four emperors whom he placed on the throne, Majorian (457-61) alone played any imperial part outside Italy. Ricimer died in 472, and two years later a Pannonian, Orestes, attempted to fill his place. He deposed Julius Nepos and proclaimed as Augustus his own son Romulus. But the barbarian mercenaries in Italy determined to secure for themselves a position there as that as which their kinsfolk had won in Gaul and Spain and Africa. Their demand for a third of the lands of Italy was refused by Orestes, and they instantly rose in revolt. On the defeat and death of Orestes they proclaimed their leader, Odacer the Ruginicus, king of Italy. Romulus Augustulus laid down his imperial dignity, and the court at Constantinople was informed that there was no longer an emperor of the West. The installation of a barbarian king in Italy was the natural climax of the changes which had been taking place in the West throughout the 5th century. In Spain, Gaul and Africa barbarian chieftains were already established as kings. In Italy, for the last twenty years, the real power had been wielded by a barbarian officer, Odacer, when he decided to dispense with the nominal authority of an emperor of the West, placed Italy on the same level of independence with the neighbouring provinces. But the old ties with Rome were not severed. The new king of Italy formally recognized the supremacy of the one Roman emperor at Constantinople, when he was invested in return with the rank of "patrician," which had been held before him by Aëtius and Ricimer. In Italy too, as in Spain and Gaul, the laws, the administrative system, and the language remained Roman. But the emancipation of Italy and the Western provinces from direct imperial control, which is signalized by Odacer's accession, has rightly been regarded as marking the opening of a new epoch. It made possible in the West the development of a Romano-German civilization; it facilitated the growth of new and distinct states and nationalities; it gave a new impulse to the influence of the Christian church, and laid the foundations of the power of the bishops of Rome.

**Division of the Empire:**

- **West:**
  - 364. Valens.
  - 379. Theodosius I.
  - 402. Valentinian II.
  - 425. Gratian and Valentinian II.
  - 432. Theodosius II.
- **East:**
  - 408. Theodosius II.
  - 423. Valentinian III.
  - 455. Maximus.
  - 458. Arcadius.
  - 450. Marcian.
  - 475. Leo I.
  - 470. Anthemiianus.
  - 472. Olybrius.
  - 475. Glycerius.
  - 475. Romulus Augustulus.

**Authorities:—I. Republican Period: Ancient Sources.** The writing of history, like other branches of literature, was a late growth among the Romans, and it is very difficult to determine how far authentic records were preserved of the earlier republican periods. But the calendars issued yearly by the pontifices and posted on the walls of the Regia were inscribed with brief notices of important events ("digna memorata...dum militiaeque terra marique gesta per singulos dies." Serv., *Ad Aen.* i. 373); and lists of tabulae were preserved and edited in 80 books by P. Mucius Scaevola (*Pontifices maximi*, 130–714 B.C.) under the name of *Annales Maximi*. The Commentarii preserved in the archives of the various priestly colleges and official boards (e.g. consuls and censors), which appear to have consisted mainly of instructions as to official procedure, doubtless furnished historical material in the shape of precedents and decisions. It is hard to say how much of this documentary evidence survived the burning of Rome by the Gauls; the fact that the earliest solar eclipse mentioned in the *Annales Maximi* was that of the 5th of June, 351 B.C., casts doubt on the completeness of the earlier records. Many modern scholars have supposed that these meagre official records were supplemented by (a) popular poetry, more or less legendary in content; (b) family chronicles, the substance of which was worked up into the funeral orations (*laudationes funebres*) pronounced at the grave of distinguished Romans. The existence of the former class of documents is, however, quite unsupported by evidence; as to family tradition, we cannot say more than that it has probably left a deposit in the accounts of republican history handed down to us, and caused the exploits of the members of illustrious houses to be exaggerated in importance.

*Setting aside the works of Greek historians who incidentally touched on Roman affairs, such as Hieronymus of Cardia, who wrote of the wars of Pyrrhus as a contemporary, and Timaeus of Tauroonemus (c. 345–290 B.C.), who treated of the history of Sicily and the West down to 272 B.C., the earliest writers on Roman history...*
were Q. Fabius Pictor and L. Cincius Alimentus, who lived during the Second Punic War and wrote in Greek. We are told by Dionysius that they treated the earlier history summarily, but wrote more fully of their own times. They were followed in their use of the Greek language by Appian. The early historians of the senate, Cato the Elder (234–149 B.C.), and A. Postumius Albinus (consul, 151 B.C.), in the meantime, however, M. Porcius Cato the Elder (234–149 B.C.), the leader of the national party at Rome and a vigorous opponent of Greek influence, had treated of Roman antiquities in his Origins. This work was long the authority on the customs and customs of the Italian peoples, and Cato founded no school of antiquarian research, but his use of the Latin language in his treatment of historical writing was followed by the amanuenses of the Gracchi. The work of the prophets, C. Censorius (235 B.C.), C. Censorius (133 B.C.), C. Sempronius Tuditanus (consul, 129 B.C.), Cn. Gallius, Vennonius, C. Fannius (consul, 122 B.C.), and L. Caecilius Antipater. By these writers some attempt was made to apply canons of criticism to the narratives of Polybius, but their attempts were little more than to rationalize the more obviously mythical narratives; they followed Greek literary models and introduced speeches, &c., for artistic effect. Where they wrote as contemporaries, however, e.g., Fannius in his account of the Gracchan movement, their works were of the highest value. About the beginning of this period Polybius (q.v.) had published his history, which originally embraced the period of the Punic Wars, and was afterwards continued to 145 B.C. His influence was not fully exerted upon Roman history until the last third of the century B.C., when a school of writers arose who treated history with a practical purpose, endeavoring to trace the motives of action and to point a moral for the edification of their readers. To this school belong particularly the orators, Gellius, C. Granius, Varius, Antias and C. Licinius Macer (d. 66 B.C.). Their writings were diffuse, rhetorical and inaccurate; Livy complains of the gross exaggerations of Valerius (whom he followed blindly in his earlier books), and Cato criticized them as evidence of the lessening faith of posterity in the value of sources of very doubtful authenticity. Contemporary history was written by Cornelius Sisenna (119–67 B.C.), and the work of Polybius was continued to 86 B.C. by the Stoic Posidonius (c. 135–45 B.C.), a man of considerable knowledge who collected memoirs of events up to his own time and, towards the memoirs, speeches and correspondence of distinguished statesmen were often published; of these no specimens are extant until we come to the Ciceronian period, when the Speeches and Letters of Cato, C. Licinius Macer, and Quintus Fabius Maximus, the latter continued to the close of the Civil War by other hands— furnishing invaluable evidence for the history of their times. We possess examples of historical pamphlets with a strong colouring in Sallust (36 B.C.—A.D. 55), and the philosophers and classic authors. Diodorus Siculus (q.v.) of Agryium in Sicily followed the earlier annalists in the sections of his Universal History (down to Caesar) which dealt with Roman affairs; Dionysius of Halicarnassus (q.v.), in his Roman Archaeology (published posthumously c. 50 B.C.), treated early Roman history in a more ambitious and rhetorical style, with greater fulness than Livy, whose work seems to have outlived. Universal histories were also written in the Augustan age by Nicolaus of Damascus, a professed of Herod the Great, and the earlier annalists of Livy; A. Cato the Elder (2nd century A.D.), Juba, the learned king of Mauritania, installed by Augustus, wrote a History of Rome as well as antiquarian works. Strabo (q.v.), whose Geography is extant, was the author of the continuation of Polybia's history (to 27 B.C.). The learning of the time exerted itself in the works of the historians of which we possess part of Festus's abridgment (2nd century A.D.), together with an Epitome of Festus by Paulus Diaconus (temp. Charlemagne). An official list of the consuls and other chief magistrates was given in the Palatine Vestals, on which the Augustan period was divided. The Forum of Augustus (see Rome, section Archaeology) was decorated with statues of famous Romans, on the bases of which were short accounts of their exploits; some of these elogia are preserved (cf. Desou, Inscr. Lat., 80–90).

Within the writers of the imperial period who dealt with republican history the most important are Velius Paterculus, whose compendium of Roman history was published in A.D. 30; Plutarch (c. A.D. 45–125), in whose biographies much contemporary material was worked up; Appian, who wrote under the Antonines and described the wars of the republic under geographical headings (partly preserved) and the civil wars in five books, and Dio Cassius (c. infra), of whose history only that portion which deals with events from 69 B.C. onwards is extant. The date of Graniius Liciinius, whose works are extant, is not certain.

The evidence of inscriptions (q.v.) and coins (q.v.) begins to be of value during the 150 years of the republic. A series of laws and Senatus consulta (beginning with the Senatus consultum de Bacchanalibus, 180 B.C.) throws light on contemporary events, while the issues of the republic from 36 B.C. onwards bear types illustrative of the traditions preserved by the families to which the masters of the mint (IIIi vers monetae) belonged.

Modern Authorities.—The principles of critical history may be looked into in the works of recent historians (see Cremutius Vico (q.v.), whose principes di scienza nuova were published in 1725. The credibility of the traditional account of Roman republican history was called in question by Louis de Beaufort (Dissertation sur l'incertitude des premieres siecles de l'historie romaine, 1738) and by other modern critical movements. The credibility of the republican writers of Augustus and Tiberius, and of the early imperial period, was called in question by the critical movement dates from Niebuhr, two volumes of Römische Geschichte appeared in 1811–12 (the third was published after his death in 1832, his lectures in 1845). The early history of Rome was fully treated by Niebuhr for Vulci, E. G. A. Segovia (q.v.), whose Römische Geschichte in 3 vols. (1854–58) was continued to 327 B.C. by O. Clasen (vols. 4 and 5, 1873–76). A reaction against the negative criticism of Niebuhr was headed by J. Rubino, who showed the pavement of Rome and the夯实 of republicanism in Geschichte des röm. Rechts (1839). He the growth of the Roman constitution might be traced with some approach to certainty by the analysis of institutions, It was left for Theodor Mommsen (Römische Geschichte, 1st ed., 1854–56; Eng. trans. revd. ed. in 5 vols., 1894–95, 1904; Sp. ed., 1872–75 [in the Historbuch der römischen Alterthümer, begun by Becker in 1843 and continued under the supervision of J. Marquardt]; Römisches Strafrecht, 1854, and many other works) to reduce Roman constitutional history to a science. In this enterprise, as in the history of the ancients, he was indebted for much to his contemporaries, F. L. Lange's Römische Alterthümer (1856–71), 5 vols., treated construction history in a narrative form. In more recent times Eduard Meyer has treated of early Italian history in his Geschichte des Altertums (1893–1902); J. Becker, in his Staer des römischen Reiches (vols. 1–2, 1898–99); and G. Ferrero, in his Römisches Grossenrad und Demokratie (in progress, Eng. trans. of vols. i., ii., 1897; 3rd ed., 1909) is ambitious but unsound.

1 The Jewish Antiquities and Jewish War of Josephus (q.v.), composed under the Flavian dynasty, are of great value for the events of the writer's time.

2 The Histories (A.D. 69–96) were written before the Annals.
to important posts, wrote on Rome's policy and wars in the East. Appian (v. supra) dealt with the wars waged under the early empire in the closing books of his work, which have not been preserved. Dio Cassius, a Bithynian who attained the dignity of a second consul, the last Roman historian, described the history of Rome to the death of Elagabalus in 80 books. We possess only epitomes and excerpts of the portion dealing with events from A.D. 46 onwards, except for parts of the 79th and 70th books, in which the last name of the emperor is given. Suetonius, a Syrian employed in the imperial service, wrote a history of the emperors from Commodus to Gaius Iulius Verus A.D. 169, and his admirable biographies of the emperors from Nerva to Elagabalus which, like those of Suetonius, contained much worthless gossip. His work was amongst the sources used in the compilation of the *De mirabilibus* (see further Acta Diac.) to which the later work of Mommsen (2 vols., 1891) is similarly treated. O. Hirschfeld, *Die römischen Verwaltungsbeamten* (1895).
The Prospopographia Imperii Romani, compiled by Dessau and Kieß (1897—1908), is a mine of information, as is the new edition of Pauly's *Reichsgeschichte* (3rd ed., 1889-1899). The *Euporium* (q.v.) is popularly written and given no references to authorities. See further the articles on individual emperors and provinces.

The *Roman Public Life* (1901) is an excellent guide to Roman institutions. The principal authorities on Roman chronology are: Ideer, *Handbuch der mathematischen Rechnungslehre* (1852—60); Fynes-Clinton, *Fasti Romani* (1845) (a continuation of the same author's *Fasti Helenici*, 1830-41, which goes down to A.D. 14); Fischer, *Romische Zeitschriften* (1846); Mommsen, *Romische Chronologie* (2nd ed., 1859); Mattat, *Römische Chronologie* (1838-44) and *Römische Zeitschriften* (1889); Holzapfel, *Römische Chronologie* (1885); Soltan, *Römische Chronologie* (1889); Unger, *Römische Zeitschriften* (1889). M. de Voguy's *Chronologie de l'empire romain* (Paris, 1891) is a useful handbook.

(H. S. J.)

IV. The Roman Republic in the Middle Ages

The history of the Roman commune as distinguished from the papacy during the middle ages has yet to be written, and only by the discovery of new documents can the difficulties of the task be completely overcome. Although very different in its origin, the Roman Republic gradually assumed the same form as the other Italian communes, and was almost identical in its institutions. But, owing to the special local conditions amid which it arose, it maintained a distinct physiognomy and character. The deserted Campania surrounding the city checked any notable increase of trade or industry, and prevented the establishment of the gilds on the solid footing that elsewhere made them the basis and support of the commune. There was also the continual and oppressive influence of the empire, and, above all, the presence of the papacy, which often appeared to absorb the political vitality of the city. At such moments the commune seemed annihilated, but it speedily revived and reassented itself. Consequently there are many apparent gaps in its history, and we have often extreme difficulty in discovering the invisible links connecting the visible fragments.

Even the aristocracy of Rome had a special stamp. In the other republics, with the exception of Venice, it was feudal, of Germanic or Italian form. It was based on political and commercial elements which sought its destruction. The history of municipal freedom in Italy lay in this struggle. But...
ancient aristocracy of Rome, gave it a special character and left it at the mercy of the people. Then the popes, by the bestowment of lucrative offices, rich benefices and vast estates, and, above all, by raising many nobles to the purple, introduced new blood into the Roman aristocracy, and ended it with increasing strength and vitality. Always divided, always turbulent, this irrepressible body was a continual source of discord and civil war, of permanent confusion and turmoil. Amidst all these difficulties the commune struggled on, but never succeeded in preserving a regular course or administration for long. What with continual warfare, attacks on the Capitol and consequent slaughter, pillage and incendiaria, it is no wonder that so few original documents are left to illustrate the history of the Roman Republic. Nor have chroniclers and historians done much to supply this want, since, in treating of Roman affairs, their attention is mainly devoted to the pope and the emperor. Nevertheless, we will attempt to connect, in due order all the facts gleaned from former writers and published records.

The removal of the seat of the empire to Constantinople effected a radical change in the political situation of Rome; nor was this change neutralized by the formation of the weak Western empire soon to be shattered by the Germanic invasions. But we still find Roman laws and institutions; and no sign is yet manifest of the rise of a medieval municipality. The earliest germ of this new type of municipality is seen during the barbarian invasions. Of these we need only enumerate the four most important—those of the Goths, Byzantines (who, however, were not mere barbarians but civilized and corrupt), Lombards and Franks. The Gothic rule merely superimposed upon the Roman social order a Teutonic stratum, that never penetrated beneath its surface. The Goths always remained a conquering army; according to the German custom, they took possession of one-third of the vanquished territory, but, while forbidding the Romans to bear arms, left their local administration intact. The see, the curia, the principal magistrates, both provincial and municipal, the prefect of the city, and the Roman judges enforcing the enactments of the Roman law, were all preserved. Already, under the empire, the civil power had been separated from the military, and this separation was maintained. Hence there was no visible change in the constitution of the state. Only, now there were conquered and conquerors. All real and effective power was on the side of brute force, and the Goths alone bore arms. In every province they had their comites, or heads of the army, who had judicial power over their countrymen, especially in criminal cases. Here, then, was a combination of civil and military jurisdiction altogether contrary to Roman ideas. Nor can it be denied that the comites, as chiefs of the armed force, necessarily exerted a direct or indirect influence on the civil and administrative power of the provinces, and especially upon the collection of the imposts. The civil arm, being virtually subordinate to the military, suffered unavoidable change. Notwithstanding the praise lavished on Theodoric, the kingdom founded by him in Italy had no solid basis. It was composed of two nations differing in race and traditions and even in religion, since the Goths were Arians and the Romans Catholics. The latter were sunk in degeneracy and corruption; their institutions were old and decrepit. It was necessary to infuse new life into the worn-out body. This was difficult, perhaps impossible; and at any rate Theodoric never attempted the task. Little wonder then if the Gothic kingdom succumbed to the Byzantine armies from Constantinople.

The wars of Belisarius and Narses against the Goths lasted twenty years (535-55 a.d.), caused terrible slaughter and devastation in Italy, and finally subjected her to Constantinople. In place of a Gothic king she was ruled by a Greek patrician, afterwards entitled the exarch, who had his seat of government at Ravenna as lieutenant of the empire. In the chief provincial cities the ruling counts were replaced by dukes, sub-ordinate to the exarch; and the smaller towns were governed by military tribunes. Instead of dukes, we sometimes find magistri militum, apparently of higher rank. The praefectus praetorio of Italy, likewise a dependent of the exarch, was at the head of the civil administration. The pragmatic sanction (554), promulgating the Justinian code, again separated the civil from the military power, which was no longer allowed to intervene in the settlement of private disputes, and, by conferring on the bishops the superintendence of and authority over the provincial and municipal government, soon led to the increase of the power of the church, which had already considerable influence.

The new organization outwardly resembled that of the Goths: one army had been replaced by another, the counts by dukes; there was an exarch instead of a king; the civil and military jurisdictions were more exactly defined. But the army was not, like that of the Goths, a conquering nation in arms; it was a Graeco-Roman army, and did not hold a third of the territory which was now probably added to the possessions of the state (fisc). The soldiery took its pay from Constantinople, whence all instructions and appointments of superior officers likewise proceeded. In Rome we find a magister militum at the head of the troops. The Roman senate still existed, but was reduced to a shadow. Theodoric had left it intact until he suspected it of hostile designs and dealings with the Byzantines, but then began to persecute it, as was proved by the wrought fate of Boetius and Symmachus. Nevertheless the senate survived, added the functions of a curia or municipal council to those of a governmental assembly, and took part in the election of the pope—already one of the chief affairs of Rome. So many senators, however, were slaughtered during the Byzantine War that it was commonly believed to be extinct. The pragmatic sanction, conferring on senate and pope the superintendence of weights and measures in Italy, might seem a convincing proof to the contrary, although, in the general scheme, now that Rome was a mere provincial city, constantly exposed to attack, we may imagine to what the senate was reduced.

All Roman institutions were altered and decayed; but their original features were still to be traced, and no heterogeneous element had been introduced into them. The first dawn of a completely new epoch can only be dated from the invasion of the Lombards (568-72). Their conquest of a large portion of Italy was accompanied by the harshest oppression. They abolished all ancient laws and institutions, and not only seized a third of the land, but reduced the inhabitants almost to slavery. But, in the unsubdued parts of the country—namely, in Ravenna, Rome and the maritime cities—a very different state of things prevailed. The necessity for self-defence and the distance of the empire, now too worn out to render any assistance, compelled the inhabitants to depend solely on their own strength. Thus, in the ancient maritime cities, such as Naples, Amalfi, Pisa and Venice, soon attained to a greater or less degree of liberty and independence.

This is the moment in which ancient society seems to disappear completely and a new one begins to rise. Ancient customs disappear, Christian processions take the place of the ancient games, ancient temples are transformed into churches and dedicated to new saints. If Roman tradition in Italy can ever be said to have been completely broken, this could only be during the Longobard domination. It is certain, however, that soon the elements of ancient culture began to revive once more. A special state of things now arose in Rome. We behold the rapid growth of the papal power and the continual increase of its moral and political influence. This had already begun under Leo I, and been further promoted by the pragmatic sanction. Not only the superintendence but often the nomination of public functionaries and judges was now in the hands of the popes. And the accession to St Peter's chair of a man of real genius in the person of Gregory I, surnamed the Great, marked the beginning of a new era. By force of individual character, as well as by historic
necessity, this pope became the most potent personage in Rome. Power fell naturally into his hands; he was the true representative of the city, the born defender of church and state. His ecclesiastical authority, already great throughout Italy, was specially great in the Roman diocese and in southern Italy. The continual offerings of the faithful had previously endowed the church with enormous possessions in the province of Rome, in Sicily, Sardinia and other parts. The administration of all this property soon assumed the shape of a small government council in Rome. In the middle ages the owner of the land was also master of the men who cultivated it, and exercised political authority as well; these administrators therefore protected and succoured the oppressed, settled disputes, nominated judges and controlled the ecclesiastical authorities. The use made by the pope of his revenues greatly contributed to the increase of his moral and political authority. When the city was besieged by the Lombards, and the emperor left his army unpaid, Gregory supplied the required funds and thus made resistance possible. And, when the defence could no longer maintain, he alone, by the weight of his personal influence and the payment of large sums, induced the Lombards to raise the siege. He negotiated in person with Agilulph, and was recognized by him as the true representative of the city. Thus Rome, after being five times taken and sacked by the barbarians, was, on this occasion, saved by its bishop. The exarch, although unable to give any help, protested against the assumption of so much authority by the pope; but Gregory was no usurper; his attitude was the natural result of events.

"For twenty-seven years"—so wrote this pontiff to the imperial government of Constantinople—"we lived in terror of the Longobards, nor can I say what sums we had to pay them. There is an imperial treasurer with the army at Ravenna; but here it is I who am treasurer. Likewise I have to provide for the clergy, the poor and the people, and even to succour the distress of other churches." It was at this moment that the new Roman commune began to take shape and acquire increasing vigour owing to its distance from the seat of the empire and its resistance to the Lombard besiegers. Its special character was now to be traced in the preponderance of the military over the civil power. A Roman element had penetrated into the army, which was already possessed of considerable political importance. The prefect of Rome loses authority and seems almost a nullity compared with the magister militem. Hardly anything is heard of the senate. "Quia enim Senatus deest, populus interit," exclaims Gregory in a moment of despair. The popes now make common cause with the people against the Lombards on the one hand and the emperor on the other. But they avoid an absolute rupture with the empire, lest they should have to face the Lombard power without any prospect of help. Later, when the growing strength of the commune becomes menacing, they remain faithful to the empire in order not to be at the mercy of the people. It was a permanent feature of their policy never to allow the complete independence of the city until they should be its so called absolute masters. But that time was still in the future. Meanwhile pope and people joined in the defence of their common interests.

This alliance was cemented by the religious disputes of the East and the West. First came the Monothelitc controversy regarding the twofold nature of Christ. Later a long and violent struggle ensued, in which the people of Rome and of other Italian cities sided so vigorously with the popes that John VI. (701–5) had to interpose in order to release the exarch from captivity and prevent a definitive rupture with the empire. Then (710–11) Ravenna revolted against the emperor, organized its armed population under twelve flags, and almost all the cities of the exarchate joined in a resistance that was the first step towards the independence of the Italian communes. A still fiercer religious quarrel then broke out concerning images. Pope Gregory II. (715–31) opposed the celebrated edict of the iconoclastic emperor Leo the Isaurian. Venice and the Pentapolis took up arms in favour of the pope, and elected dukes of their own without applying to the emperor. Again public disorder rose to such a pitch that the pope was obliged to check it lest it should go too far.

In the midst of these warlike tumults a new constitution, almost a new state, was being set up in Rome. During the conflict with Philippicus, the Monothelite and heretical emperor who ascended the throne in 711, the Liber Pontificalis makes the first mention of the duchy of Rome (ducatus Romanae urbis), and we find the people struggling to elect a duke of their own. In the early days of the Byzantine rule the territory appertaining to the city was no greater than under the Roman Empire. But, partly through the weakness of the government of Constanti- nople, and above all through the decomposition of the Italian provinces under the Lombards, who destroyed all unity of government in the peninsula, this dukedom was widely ex- tended, and its limits were always changing in accordance with the course of events. It was watered by the Tiber, and stretched into Tuscia to the right, starting from the mouth of the Mata, by Tolfa and Bleda, and reaching as far as Orte. Viterbo was a frontier city of the Lombards. On the left the duchy extended into Latium as far as the Garigliano. It spread very little to the north-east and was badly defended on that side, inasmuch as the duchy of Spoleto reached to within fourteen miles of the Salara gate. On the other side, towards Umbria, the river Nera was its boundary line.

The constitution of the city now begins to show the results of the conditions amid which it took shape. The separation of the civil from the military power has entirely dis- appeared. This is proved by the fact that, after the year 600, there is no further mention of the prefect. His office still survived, but with a gradual change of functions, until, in the 8th century, he once more appears as president of a criminal tribunal. The constitution of the duchy and of the new republic formed during the wars with the Lombards and the exarch was substantially of an aristocratico-military nature. At its head was the duke, first appointed by the emperor, then by the pope and the people, and, as his strength and influence grew with those of the commune, he gradually became the most respected and powerful personage in Rome. The duke inhabited the palace of the Caesars on the Palatine Hill, and had both the civil and the military power in his hands; he was at the head of the army, which, being composed of the best citizens and highest nobility of Rome, was a truly national force. This army was styled the felicitissimus or florens exercitus Romanus or also the militia Romana. Its members never lost their citizen stamp; on the contrary they formed the true body of the citizens. We find mention of other ducis in Rome, but these were probably other leaders or superior officers of the army. Counts and tribunes are found in the subject cities bound to furnish aid to the capital. In fact during the pontificate of Sergius II. (844), when the duchy was threatened by a Saracen invasion, they were all requested to send troops to defend the coast, and as many soldiers as possible to the city.

At that time the inhabitants of Rome were divided into four principal classes—clergy, nobles, soldiers and simple citizens. The nobles were divided into two categories, first the genuine optimates, i.e. members of old and wealthy families with large estates, and filling high, and often hereditary, offices in the state, the church and the army. These were styled proces and primates. The second category comprised landed proprietors, of moderate means but exalted position, mentioned as nobiles by Gregory I., and constituting in fact a numerous petty nobility and the bulk of the army. Next followed the citizens, i.e. the commercial class, merchants and craftsmen, who, having as yet no fixed organization and but little influence, were simply designated as honesti civit. These, however, were quite distinct from the plebeians, plebs, vulgus populi, viri humiles, who in their turn ranked above bondsmen and slaves. The honesti civit did not
usually form part of the army, and were only enrolled in it in seasons of emergency. Nevertheless the army was not only national, but became increasingly democratic, so that in the 10th century it included every class of inhabitants except churchmen and slaves. At that period we sometimes find the whole people designated as the exercitus, those actually under arms being distinguished as the militia exercitus Romani.

These scholae were associations derived from antiquity, gaining strength and becoming more general in the middle ages as the central power of the state declined. There were scholae of notaries, of church singers, and of nearly every leading employment; there were scholae of foreigners of diverse nationalities, of Franks, Lombards, Greeks, Saxons, &c. Even the trades and crafts began to form scholae. These were at first very feeble institutions, and only later gained importance and became gilds. As early as the 8th century there were scholae militum in the army, which was thus doubly divided. But we have no precise definition of their functions. They were de facto corporations with separate property, churches and magistrates of their own. The latter were always optimates, and guarded the interests of the army. But the real chiefs of the bands of soldiers were the officers of the curia, and under the Franks the latter became comites. These were the magnifici consules, optimates de militia, often too judices de militia, since, as was the custom of the middle ages, they wielded political and judicial as well as military authority. The title of consul was now generally given to superior officers, whether civil or military. The importance of the scholae militum began to decline in the 10th century; towards the middle of the 12th they disappeared altogether, and, according to Felix Papencordt, were last mentioned in 1145. It is probable that the scholae militum signified local divisions of the army, corresponding with the city wards, which were twelve in number during the 10th and 11th centuries, then increased to thirteen, and occasionally to fourteen. It is certain that from the beginning the army was distributed under twelve flags; after the scholae had disappeared, we find it classified in districts, which were subdivided into companies. The division of cities into quarters, sestieri or rioni, corresponding with that of the army, and also with that of the municipal government, was the common practice of Florence, Siena and almost all the Italian communes. But they were usually losing importance as the gilds acquired power in Rome. The insignificance of the gilds added to the strength of the regioni or rioni, which now became the part of the army but finally grasped the reins of government. This was a special characteristic of the political constitution of the Roman commune.

We now come to a question of weightier import for all desiring to form a clear idea of the Roman government at that period. What had become of the senate? It had undoubtedly lost its original character now that the empire was extinct. But, after much learned discussion, historical authorities are still divided upon the subject. Certain Italian writers of the 18th century—Vendettini, for example—asserted with scanty critical insight that the Roman senate did not disappear in the middle ages. The same opinion backed by much learned research was maintained by the great German historian Savigny. And Leo, while denying the persistence of the curia in Lombard Italy, adhered to Savigny's views as regarded Rome. Papencordt did the same, but held the Roman senate to be no more than a curia. This judgment was vigorously contested, first by Hegel and Giesebrecht, then by Gregorovius. These writers believe that after the middle of the 6th century the senate had a merely nominal existence. According to Gregorovius no last appearance was in the year 579. After that date it is mentioned in no documents, and the chroniclers are either equally silent or merely allude to its decay and extinction. In the 8th century, however, the terms senator, senatores, senatus again appear. We find letters addressed to Pippin, beginning thus: Omnibus senatoribus et universis populis generalibus. When Leo III. returned from Germany he was met by ita procers clerorum et omnibus clericis, quam optimales et senatus, cum ex exercitu Romano in urbe, (see Anastasius, in Muratori, vol. iii. 1986). But it has been noted that the senate was never found to act as a political assembly; on occasions when it might have been mentioned in that capacity we hear nothing of it, and only meet with it in ceremonial and purely formal functions. Hence the conclusion that the term senator was used in the sense of noble, senatus of nobility, and no longer referred to an institution but only to a class of the citizens. Even when we find that the emperor Otto III. (who sought to revive all the ancient institutions of Rome) addressed an edict to the "consul and senate of Rome," and read that the laws of St Stephen were issued senatus decreto, the learned Giesebrecht merely remarks that no important changes in the Roman constitution are to be attributed to the consuls and senate introduced by Otto III. Thus for the next glimpse of the senate we must pass to the 12th century, when it was not only reformed, as some writers believe, but entirely reconstituted.

But in this case a serious difficulty remains to be disposed of. Gregorovius firmly asserts that the nobles acquired great power between the 7th and 10th centuries, not only filling the highest military, judicial and ecclesiastical offices, but also filling the municipal government, presumably with the help of a senator or prefect at their head. He further adds: "Notwithstanding the disappearance of the senate, it is difficult to suppose that the city was without governing magistrates, or without a council." Thus, after the 7th century, the optimates at the head of the army were also at the head of the citizens, and "formed a communal council in the same manner in which it was afterwards formed by the bundesrat." Now, if the nobles were called senatores and the nobility senatus, and if this body of nobles met in council to administer the affairs of the republic, there is no matter for dispute, inasmuch as all are agreed that the original senate must have had a different character from the senate of the middle ages. And, since the absence of all mention of a prefect after the 7th century is not accepted as a proof of his non-existence, and we find him reappearing under another form in the 8th century, so the silence as to the senate after the year 579, the fresh mention of it in the 8th century, and its reappearance in the 12th as a firmly reconstituted body reasonably lead to the inference that, during that time, the ancient senate had been gradually transformed into the new council. The meetings must have been held very irregularly, and probably only on emergency when important affairs had to be discussed, previously to bringing them before the parliament or general assembly of the people. Historians are better agreed as to the significance of the term consuls. The consul was at first simply a title of honour bestowed on superior magistrates, and retained that meaning from the 7th to the 11th century, but then became—as in other Italian cities—a special title of the chief officers of the state.

During this period the Roman constitution was very simple. The duke, commanding the army, and the prefect, presiding over the criminal court, were the chiefs of the republic; the armed nobility constituted the forces, filled all of superior offices, and occasionally met in a council called the senate, although it had, as we have said, no resemblance to the senate of older times. In moments of emergency a general parliament of the people was convoked. This constitution differed little from that of the other Italian communes, where, in the same way, we find all the leading citizens under arms, a parliament, a council, and one or more chiefs at the head of the government.

But Rome had an element that was lacking elsewhere. We have already noted that, in the provinces, the administrators of church lands were important personages, and exercised during the middle ages, when there was no exact division of power, both judicial and political functions. It was very natural that the heads of this vast administration resident in Rome should have a still higher station, and in fact, from the

6th century, their power increased to such an extent that in the times of the Franks they already formed a species of papal cabinet, with a share and sometimes a predominance in the affairs of the republic. There were seven principal administrators, but two of them held the chief power—the primicerius notariorum and the secundicierius, i.e. the first and under secretaries of state. When, on the constitution of the new empire, these ministers were declared to be palatine or imperial as well as papal officials, the primicerius and the secundicierius were also in waiting on the emperor, who sat in council with them when in Rome. Next came the arcarius, or treasurer; the sacellarius, or cashier; the protoscriarius, who was at the head of the papal chancery; the primus defensor, who was the advocate of the church and administered its possessions. Seventh and last came the nomenclator, or administratio, who pleaded the cause of widows, orphans and paupers. There were also some other officials, such as the testorarius, the vicellimus or steward, the cubicularius or major-domo, but these were of inferior importance. They were ecclesiastics, but not bound to be in priest’s orders. The first seven were those specially known as proceres clericorum and often still as judices de clero, since they speedily assumed judicial functions and ranked among the chief judges of Rome. But as ecclesiastics they did not give decisions in criminal cases. Thus Rome had two tribunals, that of the judices de clero, or ordinarii, presided over by the pope, and that of the judices de militia, leaders of the army, dukes and tribunes, also bearing the generic title of consuls. First appointed by the exarch and then frequently by the pope, these decided both civil and criminal cases. In the latter they were sole judges under the presidency of the prefect.

The pope was thus at the head of a large administrative body with judicial and civil powers that were continually on the increase, and, in addition to his moral authority over Christendom, was possessed of enormous revenues. So in course of time he considered himself the real representative of the Roman Republic. Gregory II. (754-77) accepted in the name of the republic the submission of other cities, and protested against the conquest by the Lombards of those already belonging to Rome. He seemed indeed to regard the territory of the duchy as the patrimony of the church. The duke was always at the head of the army, and, officiously, was always held to be an imperial magistrate. But the empire was now powerless in Italy. Meanwhile the advance of the Lombards was becoming more and more threatening; they seized Ravenna in 751, thus putting an end to the exarchate, and next marched towards Rome, which had only its own forces and the aid of neighbouring cities to rely upon. To avoid being crushed by the brute force of a foreign nation unfit to rule, and only capable of oppression and pillage, it was necessary to make an energetic stand.

Accordingly, the reigning pope, Stephen II. (754-57), appealed to Pippin, king of the Franks, and concluded with that monarch an alliance destined to inaugurate a new epoch of the world’s history. The pope consecrated Pippin king of the Franks, and named him patricius Romanorum. This title, as introduced by Constantine, had no longer the ancient meaning, but now became a sign of lofty social rank. When, however, it was afterwards conferred on barbarian chieftains such as Odoacer and Theodoric, and then on the representative of the Byzantine empire in Italy, it acquired the meaning of a definite dignity or office. In fact, the title was now given to Pippin as defender of the church, for the pope styled him at the same time patricius Romanorum and defensor or protector ecclesiae. And the king pledged himself not only to defend the church but also to wrest the exarchate and the Pentapolis from the Lombards and give them to Rome, or rather to the pope, which came to the same thing. This was considered as a restoration made to the head of the church, who was also the representative of the republic and the empire. And, to preserve the character of a restitution, the famous “donation of Constantine” was invented during this period (752-77). Pippin brought his army to the rescue (754-55) and fulfilled his promise. The pope accepted the donation in the name of St Peter, and as the visible head of the church. Thus in 755 central Italy broke its connexion with the empire and became independent; thus was inaugurated the temporal power of the papacy, the cause of so much subsequent warfare and revolution in Rome.

Its first consequences were speedily seen. In 767 the death of Paul I. was followed by a fierce revolt of the nobles under Duke Toto (Theodoro) of Nepi, who by violent means raised his brother Constantine to the chair of St Peter, although Constantine was a layman and had first to be ordained. For more than a year the new pontiff was a pibale tool in the hands of Toto and of the nobles. But the genuine papal faction, headed by a few judices de clero, asked the aid of the Lombards and made a formidable resistance. Their adversaries were defeated, tortured and put to death. Toto was treacherously slain during a fight. The pope was blinded and left half dead on the highway. Fresh and no less violent riots ensued, owing to the public dread lest the new pope, Stephen III. (768-72), elected by favour of the Lombards, should give them the city in return. But Stephen went over to the Franks, whom he had previously deserted, and his successor, Adrian I. (772-95), likewise adhered to their cause, called the city to arms to resist King Desiderius and his Lombard hordes, and besought the assistance of Charlemagne. This monarch accordingly made a descent into Italy in 773, and not only gained an easy victory over Desiderius, but destroyed the Lombard kingdom and seized the iron crown. Entering Rome for the first time in 774, he confirmed and augmented the donation of Pippin by the addition of the dukedom of Spoleto. He returned several times to Italy and Rome, making new conquests and fresh concessions to Adrian I., until the death of the latter in 795.

The position of Rome and of the pope is now substantially changed. Duke, prefect, militia and the people exist as heretofore, but are all subordinate to the head of the church, who, by the donations of Pippin and Charlemagne, has been converted into a powerful temporal sovereign. Henceforth all connexion with Byzantium is broken off, but Rome is still the mainspring of the empire, the Roman duchy its sole surviving fragment in Italy, and the pope stands before the world as representative of both. And, although it is difficult to determine how this came about, the pope is now regarded and regards himself as master of Rome. In the year 772 he entrusts the vestiaris with judicial powers over the laity, ecclesiastics, freemen and slaves nostrae Romanae respublicae. He writes to Charlemagne that he has issued orders for the burning of the Greek ships employed in the slave trade, and the city of Civita Vecchia (Centumcellae), which was always styled the “Roman city,” “our city,” “our city.” The donations of Pippin and Charlemagne are restitutions made to St Peter, the holy church and the republic at the same time. It is true that Charlemagne held the supreme power, had an immensely increased authority and actively fulfilled his duties as patricius. But his power was only occasionally exercised in Rome; it was the result of services rendered to the church, and of the church’s continual need of his help; it was, as it were, the power of a mighty and indispensable ally. The pope, however, was most tenacious of his own authority in Rome, made vigorous protests whenever rebels fled to Charlemagne or appealed to that monarch’s arbitration, and contested the supremacy of the imperial officials in Rome. Yet the pope was no absolute sovereign, nor, in the modern sense of the term, did any then exist. He asserted supremacy over many lands which continually rebelled against him, and which, for want of an army of his own, he was unable to reduce to obedience without others’ help. Neither did the republic acknowledge him as its head. It profited by
the growing power of the pope, could not exist without him, respected his moral authority, but considered that he usurped undue power in Rome. This was specially the feeling of the nobles, who had hitherto held the chief authority in the republic, and, being still the leaders of the army, were by no means willing to relinquish it. The Roman nobles were very different from other aristocratic bodies elsewhere. They were not as they pretended, descendants of the Camilli and the Scipios, but neither were they a feudal aristocracy, inasmuch as the Teutonic element had as yet made small way among them. They were a mixture of different elements, national and foreign, formed by the special conditions of Rome. Their power was chiefly derived from the high offices and large grants of money and land conferred on them by the popes; but, as no dynasty existed, they could not be dynastic. Every pope aggrandized his own kindred and friends, and these were the natural and often open adversaries of the next pontiff and his favourites. Thus the Roman nobility was powerful, divided, restless and turbulent; it was continually plotting against the pope, threatening not only his power, but even his life; it continually appealed to the people for assistance, stirred the militia to revolt and rendered government an impossibility. Hence, notwithstanding his immense moral authority, the pope was the effective head neither of the army nor of the city; or of the lower classes. The lord of vast but often insubordinate territories, the recognized master of a capital city torn by internecine feud and plots against himself, he needed the support of an effective force for his own preservation and the maintenance of the authority proffered him from all quarters. Hence the necessity of creating an empire of the West, after having snapped every link with that of the East. Thus the history of Rome is still, as in the past, a history of continual strife between pope, emperor and republic; and the city, while embittering strength from all three, keeps them in perpetual tumult and confusion.

Leo III. (796–816) further strengthened the ties between Charlemagne and the church by sending the former a letter with the keys of the shrine of St Peter and the banner of Rome. Charlemagne had already joined to his office of primicerius Paschalis and the secundierius Camillus, and backed by all who wished to liberate the city from the papal rule. During a solemn procession the pope was attacked and barbarously maltreated by his assailants, who tried to tear out his eyes and tongue (796). He was thrown into prison, escaped and overtook Charlemagne at Paderborn, and returned guarded by ten of the monarch's envoys, who condemned to death the leaders of the revolt, reserving, however, to their sovereign the right of final judgment. Charlemagne arrived in December 800, and as high justice assembled a tribunal of the clergy, nobles, citizens and Franks; he pronounced Leo to be innocent, and confirmed the capital sentence passed on the rebels. But through the intercession of the pope, who feared the wrath of the nobles, this was presently commuted into perpetual exile. And finally on Christmas day, in St Peter's, before an assemblage of Roman and Frankish lords, the clergy and the people, the pontiff placed the imperial crown on Charlemagne's head and all proclaimed him emperor.

Thus the new emperor was elected by the Romans and consecrated by the pope. But he was their real master and supreme judge. The pope existed only by his will, since he alone supplied the means for the maintenance of the temporal power, and already pretended to the right of controlling the papal elections. Yet Charlemagne was not sovereign of Rome; he possessed scarcely any regalia there, and was not in command of the army; he mainly represented a principle, but this principle was the law which is the basis of the state. The pope still nominated the Roman judges, but the emperor or his missi presided over them, together with those of the pope, and his decision was appealed to in last resort. During the Carolingian times no mention is found of the prefect, and it would seem that his office was filled by the imperial missus, or legate, the judices de clero and judices de militia. The power of the pope was now entangled with that of the republic on the one hand and that of the empire on the other. The consequent confusion of sacred and secular functions naturally led to infinite complications and disputes.

The death of Charlemagne in 814 was the signal for a fresh conspiracy of the nobles against the pope, who, discovering their design, instantly put the ringleaders to death, and was severely blamed by Louis for this violation of the imperial prerogative. While the matter was under discussion the nobles broke out in fiercer tumults, both in Rome and the Campagna. At last, in 824, the emperor Lothair came to rest, and the pope, after having constituted a new and noted papal constitution, to which Pope Eugenius II. (824–27) gave his oath of adherence. By this the partnership of pope and emperor in the temporal rule of Rome and the states of the church was again confirmed. The more direct power appertained to the pope; the supreme authority, presidency of the tribunals, and final judgment on appeal to the emperor.

The new constitution also established the right of contending parties to select either the Roman or the Teutonic code for the settlement of their disputes. During the Carolingian period it is not surprising that the commune should have been, as it were, absorbed by the church and the empire. In fact, it is scarcely mentioned in history throughout that time. And when, no longer sustained by the genius of its founder, the Frankish empire began to show signs of dissolution, the popes, finding their power thereby strengthened, began to assume many of the imperial attributes. Soon, however, as a natural consequence of the loss of the main support of the papacy, the nobles regained vigour and were once more rulers of the city. Teutonic and feudal elements had now largely penetrated into their organization. The system of granting lands, and even churches and convents, as benefices according to feudal forms, became more and more general. It was vain for the popes to offer opposition, and they ended by yielding to the current. The fall of the Frankish empire left all Italy a prey to anarchy, and torn by the faction fights of Berengar of Friuli and Guido of Spoleto, the rival claimants to the crowns of Italy and the empire. The Saracens were advancing from the south, the Huns from the north; the popes had lost all power; and in the midst of this frightful chaos a way was opened for the rise of the republics. Anarchy was at its climax in Rome, but the laity began to overpower the clergy to such an extent that the judices de militia prevailed over the judices de clero. For a long time no imperial missa or legates had been seen, and the papacy was incredibly lowered. The election of the pope had positively fallen into the hands of certain beautiful women notorious for their evil life and depravity. The aristocracy alone gained strength; now freed from the domination of the emperor, it continually wrested fresh privileges from the impotent pontiffs, and became organized as the ruling force of the republic.

Gregorovius, notwithstanding his denial of the continuation of the senate after the 6th century, is obliged to acknowledge that it appeared to have returned to life in the power of this new baronage. And, although this body was now permeated with the feudal principle, it did not discard its ancient traditions. The nobles claimed to be the main source of the empire; they wished to regain the dignity and office of patricius, and to make it, if possible, hereditary in some of their families. Nothing is known of their system of organization, but it seems

### Decline of the empire.

### Renewed power of the aristocracy.
that they elected a chief bearing the title of consul, senator, princeps Romanorum, who was officially recognized by the pope, as a patricius presided over the tribunals, and was the head of the commune.

Theophylact was one of the first to assume this dignity. His wife Theodora, known as the senatrix, was one of the women then dominating Rome by force of their charms and licentiousness. She was supposed to be the concubine of Pope John X. (914–28), whose election was due to her influence. Her daughter Marozia, in all things her worthy rival, was married to Alberic, a foreign mercenary of uncertain birth who rose to a position of great influence, and, although an alien, played a leading part in the affairs of the city. He helped to increase the power of Theophylact, who seemingly shared the rule of the city with the pope. In the bloody war that had to be waged against the Saracens of southern Italy, and at the defeat of the latter on the Garigliano (916), Theophylact and Alberic were the Roman leaders, and distinguished themselves by their valour. They disappeared from the scene after this victory, but Marozia retained her power, and bore a son, Alberic, who was destined to greater deeds. The pope found himself caught in this woman’s toils, and struggled to escape, but Marozia, gaining fresh influence by her marriage with Hugo, margrave of Tuscany, imprisoned the pontiff himself in the castle of St. Angelo (928). This fortress was the property of Marozia and the basis of her strength. The unfortunate John died within its walls. Raised to the chair by Theodora, he was deposed and killed by her daughter. The authority of the latter reached its culminating point in 931, when she succeeded in placing her son John XI. on the papal throne. On the death of her second husband she espoused Hugh of Provence, the same who in 928 had seized the iron crown at Pavia, and now aspired to the empire. Dissolute, ambitious and despotic, he came to Rome in 932, and, leaving his army outside the walls, entered the castle of St. Angelo with his knights, instantly began to play the tyrant, and gave a blow to Alberic his stepson, who detested him as a foreign intruder. This blow proved the cause of a memorable revolution; for Alberic rushed from the castle and harangued the people, crying that the time was come to shake off the tyrannous yoke of a woman and of barbarians who were once the slaves of Rome. Then, putting himself at the head of the populace, he closed the city gates to prevent Hugh’s troops from coming to the rescue, and attacked the castle. The king fled; Marozia was imprisoned, Alberic proclaimed lord of the Romans, and the pope confined to the Lateran in the custody of his own brother. Rome was again an independent state, a republic of nobles. Rid of the temporal domination of emperor and pope, and having expelled the foreigners with great energy and courage, it chose Alberic for its chief with the title of princeps alque omnium Romanorum senator.

The tendency of the Roman Republic to elect a supreme authority, first manifested in the case of Theophylact, was repeated in those of Alberic, Brancalone, Crescentio, Cola di Rienzo and others. Of the many causes of this tendency, one may be traced to the conception of the new empire of which Rome was the original and enduring fountainehead. As Rome had once transferred the empire from Byzantium to the Franks, so Rome was surely entitled to reclaim it. The imperial authority was represented by the office of patrician, now virtually assumed by Alberic. That he gave the name of Octavian to his son is an additional proof of this fact. In the Eternal City the medieval political idea has always the aspect of a resurrection or transformation of classic antiquity. This is another characteristic of the history of the Roman commune.

Alberic’s strength was due to his connexion with the nobility, to his father’s valiant service against the Saracens at the battle of Garigliano, and to the militia under his command, on which everything depended amid the internal and external dangers now threatening the new state. As yet no genuine municipal constitution was possible in Rome, where neither the people nor the wealthy burghers engaged in industry and commerce had any fixed organization. All was in the hands of the nobles, and Alberic, as their chief, frequently convened them in council, although obliged to use pressure to keep them united and avoid falling a prey to their disputes. Hence the whole power was concentrated in his grasp; he was at the head of the tribunals as well as of the army. The judices de clero and judices de militia still existed, but no longer met in the Lateran or the Vatican, under the presidency of emperor and pope or their missi. Alberic himself was their president; and, a still more significant fact, their sittings were often held in his private dwelling. There is no longer any mention of prefect or patricius. The papal coinage was inscribed with Alberic’s name instead of the emperor’s. His chief attention was given to the militia, which was still arranged in scholae, and it is highly probable that he was the author of the new division of the city into twelve regions, with a corresponding classification of the army in as many regiments under twelve flags and twelve banderesi, one for every region. The organization of the scholae could not have been very dissimilar, but doubtless Alberic had some important motive for altering the old method of classification. By means of the armed regions he included the population in the forces. It is certain that after his time we find the army much changed and far more democratic. It was only natural that so excellent a statesman should seek the aid of the popular element as a defence against the arrogance of the nobles, and it was requisite to reinforce the army in order to be prepared for the attacks threatened from abroad. This change effected, Alberic felt prepared for the worst, and began to rule with energy, moderation and justice. His contemporaries award him high praise, and he seems to have been exempt from the vices of his mother and grandmother.

In 933 Hugh made his first attack upon the city, and was repulsed. A second attempt in 936 proved still more unfortunate, for his army was decimated by a pestilence. Though disheartened, he not only made peace, but gave his daughter in marriage to Alberic, thus satisfying the latter’s desire to ally himself with a royal house. But this union led to no conciliation with Hugh. For Alberic, finding his power increased, marched at the head of his troops to consolidate his rule in the Campania and the Sabine land. On the death of his brother, Pope John XI., in 936, he controlled the election of several successive popes, quelled a conspiracy formed against him by the clergy and certain nobles instigated by Hugh, and brilliantly repulsed, in 941, another attack by that potentate. At last, however, this inveterate foe withdrew from Rome, being summoned to the north by the victories of his rival Berengarius. But Alberic, after procuring the election of various popes who were docile instruments of his will, experienced a check when Agapetus II. (946–55), a man of firmness and resource, was raised to the papal throne. The fortunes of Berengarius were now in the ascendant. In 950 he had seized the iron crown, and ruled in the Pentapolis and the exarchate. This being singularly painful to the pope, he proceeded to make alliance with all those enemies of Berengarius preferring a distant emperor to a neighbouring and efficient sovereign, with the Roman. The nobles who were discontented with Alberic, and with all who foresaw danger, even to Rome, from the extended power of Berengarius. And Agapetus returned to the old papal policy, by making appeal to Otto I., whose rule in Germany was distinguished by a prestige almost comparable with that of Charlemagne.

Otto immediately responded to the appeal and descended into Italy; but his envoys were indignantly repulsed by Alberic, and, being prudent as well as firm, he decided to wait a more opportune moment for the accomplishment of his designs. Meanwhile Alberic died in 954, and the curtain fell on the first great drama of the Roman Republic. He had reigned for twenty-two years with justice, energy and prudence; he had repelled foreign invaders, maintained order and authority. He seems, however, to have realized that the aspect of affairs was about to change, that the work he had accomplished would be exposed to new dangers. These dangers, in fact, had already begun with the accession of an enterprising pope to the Holy
See. The name of Octavian given by Alberic to his son leads to the inference that he meant to make his power hereditary. But, suddenly, he began to educate this son for the priesthood, and, assembling the nobles in St Peter's shortly before his death, he made them swear to elect Octavian as pope on the decease of Agapetus II. They kept their word, for in this way they freed themselves from a ruler. Possibly Alberic trusted that both offices might be united, and that his son would be head of the state as well as the church. But the nobles knew this to be a delusion, especially in the case of a nature such as Octavian's. The lad was sixteen years old when his father died, received princely honours until the death of Agapetus, and was then elected pope with the name of John XII. He had inherited the ungoverned passions of his grandmother Marozia and great-grandmother Theodora, but without their intelligence and cunning. His palace was the scene of the most scandalous licence, while his public acts were those of a baby tyrant. He conferred a bishopric on a child of ten, consecrated a deacon in a stable, invoked Venus and Jupiter in his games, and drank to the devil's health. He desired to be both pope and prince, but utterly failed to be either. Before long, realizing the impossibility of holding in check Berengarius, who still ruled over the exarchate, he sought in 960 the aid of Otto I, and promised him the imperial crown. Thus the new ruler was summoned by the son of the man by whom he had been repulsed. Otto vowed to defend the church, to restore her territories, to refrain from usurping the power of the pope or the republic, and was crowned on the 2nd of February 962 with unheard-of pomp and display. Accordingly, after being extinct for thirty-seven years, the empire was revived under different but no less difficult conditions. The politico-religious unity founded by Charlemagne had been dissolved, partly on account of the heteromous elements of which it was composed, and partly because other nations were in course of formation. Now too the feudal system was converting the officers of the empire into independent princes, and the new spirit of communal liberty was giving freedom to the cities. Otto once more united the empire and the church, Italy and Germany, in order to combat these foes. But the difficulties of the enterprise at once came to light. John XII., finding a master in the protector he had invoked, now joined the discontented nobles who were conspiring with Berengarius against the emperor. But the latter hastened to Rome in November 963, assembled the clergy, nobles and heads of the people, and made them take an oath never again to elect a pope without his consent and that of his son. He also convened a synod presided over by himself in St Peter's, which judged, condemned and deposed Pope John and elected Leo VIII. (863-65), a Roman noble, in his stead. All this was done at the direct bidding of the emperor, who thus deprived the Romans of their most valued privilege, the right of choosing their own pope. But the people had now risen to considerable importance, and, for the first time, we find them officially represented in the synod by the plebeian Pietro, surnamed Imperiola, together with the leaders of the militia, which had also become a popular institution since Alberic's reign. It was no longer easy to keep the lower orders in subjection, and by their junction with the malcontent nobles they formed a very respectable force. On the 3rd of January 964 they sounded the battle- pae and attacked the Vatican, where the emperor was lodged. The German knights repulsed them with much slaughter, and this bloodshed proved the beginning of an endless feud. Otto departed in February, and John XII., as the chosen pope of the Romans, returned with an army of followers and compelled the defenceless Leo VIII. to seek safety in flight. Soon afterwards Leo was deposed and excommunicated by a new synod, and many of his adherents were cruelly murdered. But on the 14th of May 964 John suddenly expired; the Romans, amid violent struggles and tumults, resumed their rights, elected Benedict V., and procured his consecration in spite of the emperor's veto. Otto now appeared at the head of an army, committed fresh slaughter, besieged the city, reduced it by famine, and, after holding a council which deposed Benedict and sent him a prisoner to Hamburg, restored Leo VIII. to the papal throne.

But, although the emperor thus disposed of the papacy at his will, his arbitrary exercise of power roused a long and obstinate resistance, which had no slight effect upon the history of the commune. Leo VIII. died in 965, and the imperial party elected John XIII. (965-72). Upon this the nobles of the national party joined the people and there was a general revolt. The nobles were led by Pietro, prefect of Rome. As we have noted, this office seemed to be extinct during the Carolingian rule, but we again meet with it in 955, after an interval of a century and a half. The leaders of the people were twelve decarconi, a term of unknown derivation, but probably indicating chiefs of the twelve regions (dodocaroki, dodocarconi, decarconi). The new pope was seized and confined, first in the castle of St Angelo, then in a fortress in the Campagna. But the emperor quickly marched an army against Rome, and this sufficed to produce a reaction which recalled the pope (November 965) and sent the prefect into exile, and put several of the rebellious nobles to death. And shortly after the emperor sacked the city. Many Romans were exiled, some tortured, others, including the twelve decarconi, killed. John XIII. died in 972 and Otto in 973.

All these events clearly prove how great a change had now taken place in the conditions of Rome. The people (plebs) had made its appearance upon the stage; the army had become democratic; the twelve regions were regularly organized under leaders. Opposed to them stood the nobles, headed by the prefect, also a noble, precisely as in Florence the nobles and the podesta were later opposed to the gilds and the people. So far, it is true, nobles and people had made common cause in Rome; but this harmony was soon to be interrupted. The feudal spirit had made its way among the Roman aristocrats, had split them into two parties and diminished their strength. It was now destined to spread, and, as it was always vigorously contested and opposed by the people elsewhere in Italy, so the same consequence was inevitable in Rome. Another notable change, and a subject of unending controversy, had also occurred in the administration of justice. So far there were the judices de clero, also known as ordinary or palatine judges, and the judices de militia, also styled consules or duces. These judges generally formed a court of seven, three being de clero, four de militia, or vice versa, under the presidency of the papal or imperial missus. In criminal cases the judices de militia had the prefect or the imperial missus for their president. But there was a third order of judges called pedanei, a consultibus creati. It seems clear that the duces, being distributed per judicatus, found themselves isolated in the provinces, and to obtain assistance nominated these pedanei, who were legal experts. In Rome, with its courts of law, they were less needed, but possibly in those sections of the city where cases of minor importance were submitted to a single magistrate reference was made to the pedanei. But many changes were made under the Franks, and when the edict of Lothair (834) granted free choice of either the Roman or Germanic law, and the duces were replaced by comites and gastaldiones, chiefly of German origin, the use of legal experts became increasingly necessary. And the custom of employing them was the more easily diffused by being already common among the Franks, whose scabini were legal experts acting as judges, though not qualified to pass sentence. Thus the pedanei multiplied, came to resemble the scabini, and were designated judices duxivi (a magistratu duxiti) or simply duxivi. These were to be found in the exarchate in 838, but not in Rome until 961, when the judiciae de militia had ceased to exist. The great progress of the German legal procedure may then have contributed to the formation of the new office.

Meanwhile Pope John XIII. had succeeded by Benedict VI. (973-74) and Otto I. by his son Otto II., a youth
of eighteen married to the Byzantine princess Theophano. Thereupon the Romans, who had supported the election of another pope, and were in no awe of the new emperor, rose to arms under the command of Crescenzio, a rich and powerful noble. They not only seized Benedict VI. by force, but strangled him in the castle of St Angelo. The national and imperial parties then elected several popes who were either exiled or persecuted, and one of them was said to be murdered. In 985 John XV., was elected (985-96). During this turmoil, the national party, composed of nobles and people, led by Giovanni Crescenzio, son of the other Crescenzio mentioned above, had taken complete possession of the government. This Crescenzio assumed the title of patrician, and sought to imitate Alberic, although far his inferior in capacity. Fortunately for him, the reigning pope was a detested tyrant, and the emperor a child entirely guided by his mother. But the new emperor Otto III. was backed by a powerful party, and on coming to Rome in 996 was able, although only aged fifteen, to quell the rebellion,oust Crescenzio from public life, and elect as successor to John XV. his own cousin, Pope Gregory V. (996-99). But this first German pope seduced himself with compound bribes, and was found by those who elected him to lofty posts even in the tribunals excited a revolt that drove him from the throne (29th September 999). Crescenzio, being master of the castle of St Angelo, resumed the title of patrician or consul of the Romans, expelled the German judges, reconstituted the government, prepared his troops for defence, and created a new pope. But the following year Otto III. came to Rome, and his party opened the gates to him. Although deserted by nearly all his adherents, Crescenzio held the castle valiantly against its besiegers. At last, on the 29th of April 998, he was forced to make terms, and the imperialists, violating their pledges, first put him to torture and then hurled him from the battlements. Gregory V. dying shortly after these events, Sylvester II., another native of southern France, who had been tutor to the emperor Otto III., was raised to the papacy (999-1003).

Thus Otto III. was enabled to establish his mastery of Rome. But, as the son of a Greek mother, trained amid Greek influences, his fantastic and contradictory nature seemed to fit him for the good fortune of being the first German papal emperor, and of assuming the dignity of a Romano-Byzantine empire with Rome for his capital. His discourse always turned on the ancient republic, on consuls and senate, on the might and grandeur of the Roman people; and his edicts were addressed to the senate and the people. The senate is now constantly mentioned, and its heads bear the title of consuls. The emperor also gave renewed honour to the title of patrician, surrounded himself with officials bearing Greek and Roman designations, and raised the prestige of the prefect, who, having now almost the functions of an imperial vicar, bore the eagle and the sword as his insignia. Nevertheless Otto III. was thoroughly German, and during his reign all Germanic institutions made progress in Rome. This was particularly the case with feudalism, and Sylvester II. was the first pope to treat it with favour. Many families of real feudal barons now arose. The Crescenzii held sway in the Sabine hills, and Praeneste and Tusculum were great centres of feudalism in the 11th century. The system of feudal benefices was recognized by the church, which made grants of lands, cities and provinces in the feudal manner. The bishops, lay feudal barons, became actual counts. And, in consequence of these changes, when the emperor, as head of the feudal system, seeks to impose his will upon the church (which has also become feudal) and control the papal elections, he is met by the great question of the investitures, a question destined to disturb the whole world. Meanwhile the Roman barons were growing more and more powerful, and were neither submissive nor faithful to the emperor. On the contrary, they resented his attitude as a master of Rome, and, when he subjected Tivoli to the Holy See, attacked both him and the pope with so much vigour as to put both to flight (16th February 1001). Thereupon Rome again became a republic, headed by Gregory of Tusculum, a man of a powerful family claiming descent from Alberic.

By the emperor's death in January 1002 the race of the Ottos became extinct, the papacy began to decline, as at the end of the Carolingian period, and the nobles, divided into an imperial and a national party, were again predominant. They reserved to themselves the office of patrician, and, electing popes from their own ranks, obtained enlarged privileges and power. At the time when Ardoin, marquis of Ivrea, profiting by the extinction of the Ottos and the anarchy of Germany, was stirring Italy in the vain hope of constituting a national kingdom, the Roman Republic was being consolidated under another Giovanni Crescenzio, of the national faction. He was now elected patrician; one of his kinsmen was invested with the office of prefect, and the new pope John XVIII. (1003-9) was one of his creatures. Although the power of Henry of Bavaria was then gaining ascendency in Germany, and giving strength to the imperialists nobles, Crescenzio still remained supreme ruler of the city and the Campagna. Surrounded by his judges, the senators and his kinman the prefect, he continued to dispense justice in his own palace until his death in 1012, after ten years' rule. And, Pope Sergius IV. having died the same year, the counts of Tusculum compassed the election of Benedict VIII. (1012-24), one of their own kin. This pope expelled the Crescenzii, changed the prefect and reserved the title of patrician for Henry II., whom he consecrated emperor on the 14th February 1014. A second Alberic, bearing the title of "eminentissim us consul et dux," was now at the head of the republic and dispensed placita in the palace of his great ancestor, from whom the counts of Tusculum were also descended.

The new emperor endeavoured to re-establish order in Rome, and strengthen his own authority together with that of the pope. But the nobles had in all things the upper hand. They were regularly organized under leaders, held meetings, asserted their right to nominate both pope and emperor, and in fact often succeeded in so doing. Even Henry II. himself was obliged to secure their votes before his coronation. The terms senate and senator now recur still more frequently in justice in his own palace. Until his death in 1024, and in the same year Henry II. was succeeded by Conrad II. There was now a whole repetition of the same strange event that had followed the death of Alberic, and with no less fatal consequences. Benedict's brother Romano, head of the republic, and still retaining office, was, although a layman, elected pope. He took the name of John XIX. (1024-33), and in 1027 conferred the imperial crown on Conrad the Salic, who, abolishing the Lotharian edict of 824, decreed that throughout Rome and its territory religious causes should be henceforth administered solely by the Justinian code. Thus, notwithstanding the spread of feudalism and Germanic procedure, the Roman law triumphed through the irresistible force of the national character, which was already manifested in many other ways.

Meanwhile John XIX. was succeeded by his nephew, Benedict IX. (1033-45), a lad of twelve, who placed his own brother at the head of the republic. Thus church and state assumed the aspect of hereditary possessions in the powerful house of the counts of Tusculum. But the vices and excesses of Benedict were so monstrous that the papacy sank to the lowest depth of corruption; there followed a series of tumults
and reactionary attempts, and so many conflicting elections that in 1045 three popes were struggling for the tiara in the midst of scandal and anarchy. The streets and neighbourhood of Rome swarmed with thieves and assassins; pilgrims were plundered; citizens trembled for their lives; and a hundred petty barons threatened the rival popes, who were obliged to defend themselves by force. This state of things lasted until Henry III. came to re-establish order. He appointed a synod to depose the three popes, and then, with the consent of the wearied and anarchy-stirred Romans, assuming the right of election, proposed a German, Clement II., who was consecrated at Christmas 1046. Henry III. was then crowned, and also took the title of patrician. Thus the emperor was lord over church and state. This, however, stirred both people and pope against him, and led to the terrible contest of the investitures, although for the moment the Romans, being exhausted by past calamities, seemed not only resigned but contented.

In fact, the idea of reform and independence was already germinating in the church and was soon to become tenacious and irresistible. Hildebrand was the prompter and hero of this idea. He sought to abolish the simony and concubinage of the priesthood, to give the papal elections into the hands of the higher ecclesiastics, and to emancipate the church from all dependence on the empire. Henry III. procured the election of four German popes in succession, and Hildebrand was always at hand to inspire their actions and dominate them by his strength of intellect and still greater strength of will. But the fourth German pope, Victor II., died in 1057, and Henry III. had been succeeded in 1056 by the young Henry IV. under the regency of a weak woman, the empress Agnes. Hildebrand seized this favourable moment for trying his strength and procured the election of Stephen IX. (1057-58), a candidate he had long desired, and was sure of. But the pope soon put an end to Henry III.'s hopes, by seizing the papal palace, and ordering the investitures to be suspended, the nobles instantly rose in rebellion; and Gregory of Tusculum, who had assumed the patriciate, caused an incapable cousin to be named pope (Benedict X.). Upon this Hildebrand postponed his design of maintaining the papacy by the help of Italian potentates and had recourse to the empress. In a synod held at Siena with her consent Benedict was deposed and Nicholas II. (1059-61) elected in his stead. This pope entered Rome escorted by the troops of Godfrey of Tuscany, and, when also assured of help from Naples, assembled a council of one hundred and thirteen bishops (1059), who deposed the pontiff and renewed the prohibition of simony and concubinage among the priesthood. Finally Nicholas instituted the college of cardinals, entrusting it with the election of the pope, who was in future to be chosen from its ranks. The assent of the clergy and people was left purely formal. The decree also contained the proviso—"saving the honour and reverence due to the emperor"; but this too was an empty expression.

The new decree was a master-stroke of Hildebrand's genius, for by means of it he placed the papal election in the hands of a genuine ecclesiastical senate and gave a monarchical form to the church. Backed by the Normans who were in Rome, and whose commander, Richard of Capua, did not scruple to strike off the heads of many recalcitrant nobles, Hildebrand and the pope could now pursue their work of reform. Nevertheless the nobles again revolted on the death of Nicholas II. in 1061, and declared their purpose of restoring to Henry IV. the patriciate and right of election; but Hildebrand, by speedily convoking the cardinals, procured the election of Alexander II. (1061-73). This pope, although friendly to the empire, did not await the imperial sanction, but, protected by the Romans, at once entered the Lateran and put some of the great and small nobles to death. The German bishop, however, elected Honorius II., who had the support of the barons. Thus the city was split into two camps and a deadly civil war ensued, terminating, despite the vigorous resistance of the nobility, in the defeat of Honorius II. But the nobles persevered in the contest and were the real masters of Rome. By conferring the patriciate on the emperor, as their feudal chief, they hoped to organize themselves under the prefect, who now, with greatly increased authority, presided over both the civil and criminal courts in the absence of the pope's representative. In a general assembly the Romans elected their prefect, whose investiture was granted by the emperor, while the pope elected another. Thus disorder was brought to a climax.

Alexander died on the 21st April 1073, and thereupon Hildebrand was at last raised to the chair as pope Gregory VII. (1073-85). He reconfirmed his predecessors' decrees, dismissed all simoniacal and non- celibate priests, and then in a second council (1075) forbade the clergy to receive investiture at the hands of laymen. No bishop nor abbot was again to accept ring or crozier from king or emperor. Now, as ecclesiastical dignities included the possession of extensive benefices, privileges and feudal rights, this decree gave rise to tremendous dispute and to fierce contest between the empire and the church. The nobles took a very decided part in the struggle. With Cenci, their former prefect, at their head, they rose in revolt, assailed the pope on Christmas day 1075, and threw him into prison. But their fear of the popular wrath compelled his speedy release; and he then decreed the excommunication and deposition of the emperor who had declared him deposed. That monarch afterwards made submission to Gregory at Canossa (1077), but, again turning against him, was again excommunicated. And in 1081 he returned to Italy bringing the antipope Clement III., and besieged Rome for forty days. Assembling the nobles in his camp, he there arranged a new government of the city with prefect and senate, palatine judges and other magistrates, exactly similar to the existing government within the walls. He then took his departure, returned several times in vain, and his forces were driven back to the city (March 1084) and compelled Gregory VII. to seek refuge in the castle of St. Angelo. The emperor was then master of Rome, established the government he had previously arranged and, calling a parliament of nobles and bishops, procured the deposition of Gregory and the consecration of Clement III., by whom he was crowned in 1084. He then attacked and seized the Capitol, and assaulted the castle in order to capture the pope. But Robert Guiscard brought his army to the rescue. Emperor and antipope fled; the city was taken, the pope liberated and Rome reduced to ruin by fire and pillage. Upon this Gregory VII., broken with grief, went away with the Normans, and died at Salerno on the 25th May 1085. He had separated the church from the people and the empire by a struggle that, as Gregorovius says, disturbed the deep sleep of the middle ages.

Pope Paschal II. (1099-1118) found himself entirely at the mercy of the tyrannous nobles who were alike masters of Rome, of its government, and its spiritual lord. As they were divided among themselves, all the pope could do was side with one party in order to overcome the other. With the help of his own nephew Gualfredo, the prefect Pietro Pierleone, and the Frangipani, he was able to keep down the Corsi, and hold the Colonna in check. Being compelled to repair to Benevento in 1108, he left Gualfredo to command the militia, Tolomeo of Tusculum to guard the Campagna, and the consuls Pierleone and Leone Frangipani, together with the prefect, in charge of the government. The consulsipship was no longer a mere title of honour. The consuls seem to have been elected, as at Ravenna, in imitation of those of the Lombard cities, and were at the head of the nobles and senate. The expressions "praefectus et consules," "de senato et consiliis," are now of frequent occurrence. We have no precise knowledge of the political organization of the city at this moment; but it was an aristocratic government, similar to that originally formed in Florence, as Villani tells us, with a senate and consuls. The nobles were so completely the masters that the pope, in spite of having trusted them
with the government, could only return to Rome with the aid of the Normans. Being now absorbed in the great investiture question, he had recourse to a daring plan. He proposed to Henry V. that the bishops should resign all property derived from the crown and depend solely on tithes and donations, while the empire should resign the right of investiture. Henry seemed disposed to accept the suggestion, but, suddenly changing his mind, took the pope prisoner and forced him to yield the right of investiture and to give him the crown (1111). But the following year the party of reform annulled in council this concession, which the pope declared to have been extorted by force. By the death of Countess Matilda in 1115 and the bequest of her vast possessions to the Holy See, the pope's dominions were greatly enlarged, but his authority as a ruler was nowise increased. Deeds of violence still continued in Rome; and then followed the death of the prefect Pietro. The nobles of the imperial party, joined with the people, wished to elect Pietro's son, also nephew to Tolomeo of Tusculum, who then held the position of a potent imperial margrave, had territories stretching from the Sabine mountains to the sea, was the dictator of Tusculum, master of Latium and consul of the Romans. The pope opposed this election to the best of his strength; but the nobles carried the day, and their new prefect reigned investiture-free and unopposed until his death. After then again quitting Rome, and on his return, two years later, was compelled to shut himself up in the castle of St. Angelo, where he died in 1118.

The popes were now the sport of the nobles whom they had aggrandized by continual concessions for the sake of peace. And peace seemed at hand when Innocent II. (1130-43.), after triumphing over two antipopes, came to terms with Roger I., recognized him as king of Sicily, and gained his friendship and protection. But now still graver tumults took place. In consequence of the division of the nobles neither party could overcome its foes without the aid of the people, which thus became increasingly powerful. Throughout upper and central Italy the cities were being organized as free and independent communes on a democratic basis. Their example soon followed in the ancient duchy of Rome and almost in the immediate neighbourhood of the city. Even Tivoli was converted into a republic. This excited the deepest jealousy in the Romans, and they became furious with their exiled pope, pointing to his strength in the events of one valley, not only sought to repossess Roman territory but dared to offer successful resistance to the descendants of the conquerors of the world. In 1141 Tivoli openly rebelled against the mother city, and the pope sent the Romans to subdue it. They were not only repulsed, but ignominiously pursued to their own gates. Afterwards, returning to the assault in greater numbers, they conquered the hostile town. Its defenders surrendered to the pope, and he immediately concluded a treaty of peace without consulting either the people or the republic. The soldiery, still flushed with victory, were furious at this slight. They demanded not only submission of Tivoli to the Roman people, but also permission to demolish its walls and dwellings and expel its population. Innocent II. refused consent to these excesses, and a memorable revolution ensued by which the temporal power of the papacy was entirely overthrown.

In 1143 the rebellious people rushed to the Capitol, proclaimed the republic, reconstituted the senate, to the almost entire exclusion of the nobles, declared the abolition of the tithes, and banished the pope. In the senate, the people and St. Peter, and began to reckon time from the day of the restoration of liberty. Arnold of Brescia was not, as has been incorrectly stated, the author of this revolution, for he had not yet arrived in Rome. It was the outcome of an historic necessity—above all, of the renewed vigour of the people and its detestation of the feudal aristocracy. This body, besides being divided into an imperial and a national party, had almost been excluded from the government the powerful baronage of the Campagna and the provinces. Also, as we have before noted, the Roman aristocracy was by no means an exclusive caste. Between the great aristocrats and the people there stood a middle or new nobility, which made common cause with the people, whose chief strength now lay in the army. This, divided into twelve and then into thirteen or fourteen regions, assembled under its banners all arm-bearing citizens. Thus the exercitus was the real populus Romanus, now bent on the destruction of the temporal power. This purpose, originating in the struggle of the investitures, was the logical and inevitable result of the proposals of Paschal II., which, despite their rejection, found a loud echo in Italy. Lucius II. (1144-45) tried to withstand the revolution by seeking Norman aid and throwing himself into the arms of the feudal party, but this only precipitated the course of events. The people, after having excluded nearly all aristocrats from the senate, now placed at its head the noble Giordano dei Pierleoni, who had joined the revolutionary party. They named him patrician, but without prejudice to the authority of the empire, still held by them in respect, and also conferred on him the judicial powers appertaining to the aristocratic and imperial office of prefect. The pope was requested to resign the temporal power, the regalia and every other possession, and consent himself with the concord of the other things, stipulating certain privileges of the fiscal reform, including release of Paschal II. He indignantly refused, marched at the head of the nobles against the Capitol, but was violently repulsed, and received a blow on the head from a stone, which is supposed to have occasioned his speedy death on the 15th February 1145. Eugenius III. was then elected (1145-53), but soon had to fly to Viterbo in quest of armed assistance, in consequence of the senate's resolve to prevent his consecration by force until he recognized the new state of things in the Eternal City.

It was at this moment that Arnold of Brescia arrived in Rome. His ideas, already well known in Italy, had inspired and promoted the Roman revolution, and he now came to determine its method and direction. Born at Brescia in the beginning of the 12th century, Arnold had studied in France under the celebrated Abelard, who had instructed him in theology and philosophy, inspired him with a great love for antiquity, and stimulated his natural independence of mind. On returning to his native land he assumed the monkish habit, and proved the force and fervour of his character by taking part in a struggle with his abbot. And together with the feudal reform, he preached his favourite doctrine of the necessary renunciation by the clergy of all temporal wealth. Expounded with singular eloquence, these doctrines had a stirring effect on men's minds, spread throughout the cities of northern Italy, and were echoed on all sides. It seems undoubted that they penetrated to Rome and helped to promote the revolution, so that Arnold was already present in spirit before he arrived there in person. It is known that at the Lateran council of 1139 Innocent II. had declared these doctrines to be inimical to the church and enjoined silence on their author. And, as at that time the party hostile to liberty was triumphant in Brescia, Arnold left his native place, crossed the Alps and returned to France, where other struggles awaited him. He professed no anti-Catholic dogmas,—only maintaining that when the pope and the prelacy deviated from the gospel rule of poverty they should not be obeyed, but fearlessly opposed. In France, finding his master, Abelard, exposed to the persecutions of St. Bernard, he assumed his defence with so much ardour that St. Bernard directed the mob of the colons to mob the abbot, and, as well as the master, saying of the former, "He neither eats nor drinks, suffers hunger, and, being leagued with the devil, only thirsts for the blood of souls." In 1142 we find Arnold a wanderer in Switzerland, and then, suddenly reappearing in Italy, he arrived in Rome.

Three different elements entered into his nature and inspired his eloquence—an exalted and mystic temperament, a great and candid admiration for classic antiquity added to an equal admiration for republican freedom independent of the church.
and the empire, and a profound conviction, derived from the Vaudois and Paterine doctrines, that the church could only be purified by the renunciation of temporal wealth. Finding Rome already revolutionized in accordance with his own ideas, he immediately began to preach there. His mystic exhortations against the riches of the church had an inflammatory effect, while his classical reminiscences aroused the enthusiasm of the Romans, and his suggestion that they should imitate the republican institutions of upper Italy met the necessities of the time that had created the revolution. He urged the reconstitution of the ancient senate and senatorial order, which indeed was already partially accomplished, and of the ancient equestrian order, and the reconstruction and fortification of the Capitol. His proposed senate was a body somewhat resembling the communal councils of upper Italy, his equestrian order a mounted force composed of the lesser nobility, since at Rome, as elsewhere, the lower classes had neither time nor means to form part of it. All his suggestions were accepted; the citizens laboured strenuously on the fortification of the Capitol. The pope soon beheld the revolution spread beyond the walls, and several cities of the state proclaimed their independence. The barons of the Campagna profited by the opportunity to act as independent sovereigns. Thus the whole domain of the church was threatened with dissolution. The pope marched towards Rome with his newly gathered army, but hoped to come to terms. The Romans in fact recognized his authority, and he in turn recognized the republic. The office of patrician was abolished, and seems to have been replaced by that of gonfalonier, and the prefect, answering to the podestà of the other republics, was revived. The senators received investiture from the pope, who returned to Rome at Christmas 1143.

There public now seems to have been fully constituted. The senate was drawn from the lower classes and the petty nobility, added to the citizens, was the special characteristic of the new revolution. In 1144 there were fifty-six senators, probably four to each of the fourteen regions, but the number often varied. By the few existing documents of the period we notice that the senators were divided into senatores consiliarii and ordinary senators. The former constituted a smaller college, which, like the cedencia or lesser council found in other cities, consulted with the head or heads of the republic on the more urgent and secret affairs of the state. And, conjointly with the rest of the senators, it formed the greater council. Thus classic traditions were identified with new republican usages, and the commonwealth of Rome resembled those in other parts of Italy. But, of course, every republic had special local customs of its own. The Roman senate had judicial as well as political attributes, and there was a curia senatus composed of senators and legal experts.

As was easily to be foreseen, the agreement with the pope was of short duration. The revolution could not be checked; the Romans desired independence, and their spiritual lord fled to France, whence, in 1147, he proclaimed a new crusade, while the Romans were employed in demolishing Tivoli, banishing its inhabitants, and waging war on other cities. Giordano Fierlone was gonfalonier and head of the republic, and Arnold, supported by the popular favour and the enthusiasm of the lower clergy, was preaching with even greater fervour than before. But the pope now re-entered Italy, proclaimed Arnold a schismatic, and then advancing to Tusculum assembled an army in order to attack Rome. In this emergency the Romans applied to Conrad III., the first emperor of the house of Hohenstaufen; and their urgent letters are clearly expressive of Arnold’s theories and his medley of ancient and modern, sacred and profane, ideas. “Rome,” so they said, “is the fountain of the empire confided to you by the Almighty, and we seek to restore to Rome the power possessed by her under Constantine and Justinian. For this end we conquered and destroyed the strongholds of the barons who, together with the pope and the Normans, sought to resist us. These are now attacking us on all sides. Haste to Rome, the capital of the world, thus to establish thy imperial sway over the Italian and German lands.”

After long hesitation the king of the Romans at last replied to these appeals, stating that he would come “to re-establish order, reward the faithful, and punish the rebellious.” These words promised ill. In fact Conrad had already arranged terms with the pope; but his life came to an end on the 15th of February 1152.

He was succeeded by Frederick I. surnamed Barbarossa, who took no notice of the numerous letters urging him to come and receive the empire from the Roman people, which alone had the right of conferring it. In accordance with his design of subduing all the independent cities, he made an agreement with the pope, in which he vowed to give no truce to the Romans, but subject them to their spiritual lord, whose temporal power should be restored. The pope, on his side, promised to crown him emperor. Thereupon the pope again rose to arms, and Arnold broke off all negotiation with Eugenius III. The senate was reorganized, formed of one hundred members, and, according to the old Roman precedent, had two consuls, one for internal and the other for external affairs. Frederick was a daring statesman, a valiant soldier in command of a powerful army, and was no friend of half measures. Accordingly the nobles ventured on reaction. Finally, to increase the gravity of the situation, an English pope, Adrian IV., was elected (1154—59), who was also a man of strong and resolute temper. In fact, even before being able to take possession of the Lateran, he requested the Romans to banish Arnold, who, with greater eloquence than ever, was directing his thunders against the papacy. These utterances increased the wrath of Adrian, who, encouraged by the knowledge that Frederick and his host were already in Italy, at last launched an interdict against Rome. It was the first time that a pope had ventured to curse the Eternal City. The interdict put a summary end to the revolution; Arnold was deposed, his adherents were seized with a sudden terror, and a fierce tumult broke out. Thereupon the senators, whose opposition to the pope was less courageous than that of the fallen magnates, prostrated themselves at his feet and implored pardon. But Adrian demanded the expulsion of Arnold before consenting to raise the interdict. Arnold was therefore obliged to leave Rome. After having for nine years preached successfully in favour of liberty, after having been the moving spirit of the new revolution, the new constitution, he was now abandoned by all, and forced to wander from castle to castle, in the hope of reaching some independent city capable of shielding him from the fierce enmity of the pope. Meanwhile Frederick I. had achieved his first victories in Lombardy, and, leaving ruined cities and bloodshed in his track, was rapidly advancing towards central Italy. The pope sent three cardinals to him, with a request for the capture and confinement of Arnold, who had taken refuge in the castle of the Visconti of Campagnatico. Frederick without delay caused one of the Visconti to be seized and kept prisoner until Arnold was given up, and then consigned the latter to the papal legates. The pope in his turn gave the reformer into the hands of the prefect, Pietro di Vico, who immediately hanged his prisoner, burnt his body at the stake and cast his ashes into the Tiber. The execution took place in June 1155. The exact date and place of it are unknown; we only know that Arnold met his fate with great serenity and firmness.

But the Romans who had so basely deserted their champion would not give up their republic. Their envoys went to meet Frederick near Sutri, and made an address in the usual fantastic style on the privileges of the Roman people and its sole right to confer the imperial crown. But Frederick indignantly cut short their harangue, and they had to depart full of rage. He then continued his march, and, entering Rome on the 18th of June 1155, was forthwith crowned in St. Peter’s by the pope. Thereupon the Romans rushed to arms, and made a furious attack on the Leonine city and the imperial camp. A desperate battle went on throughout the day; and the knights proved that the equestrian order instituted at Arnold’s suggestion was no empty
sham. About a thousand Romans perished by the sword or by drowning, but their fellow-citizens made such determined preparations to continue the struggle that Frederick, on the 19th of June, hastily retreated, or rather fled, and was escorted as far as Tivoli by the pope and the cardinals. After all, the temporal power of the papacy was not restored, and the republic still survived in the form bestowed on it by Arnold of Brescia. Its existence was in truth favourable rather than injurious to Frederick, whose aim was to rule over Rome and treat the bishops as his vassals. He had not yet discerned that his best policy would have been to use the republic as a lever against the pope. The latter, with keener acumen, while remaining faithful to the feudal party in Rome, made alliance with the communes of Lombardy and encouraged them in their resistance to the emperor. Adrian IV. died in 1159, and the national party elected Alexander III. (1159-81), who energetically opposed the project as Frederick, bolting to struggle with three antipopes successively raised against him by the imperial party, was repeatedly driven into exile. During these schisms the senate quietly carried on the government, administered justice, and made war on some neighbouring cities and barons. An army comprising many nobles of the national party marched against Tuscum, but found it defended by several valiant officers and a strong band of German soldiery, who, on the 29th of May 1167, inflicted on the Romans so severe a defeat that it is styled by Gregorius the Cannae of the middle ages. Shortly afterwards the emperor arrived in Rome with his antipope Paschal III., and Alexander had to fly before him to Benevento. Then, at last, Frederick came to terms with the republic, recognized the senate, which accepted investiture at his hands, re-established the prefecture as an imperial office, and bestowed on Giovanni, son of Pietro di Vico. He then hastily departed, without having advanced on the Linea Tiberina.

Meanwhile Pope Alexander continued the crafty policy of Adrian and with better success, for the Lombard cities had now formed a league and inflicted a signal defeat on the emperor at Legnano on the 29th of May 1176. One of the results of this battle was the conclusion of an agreement between the pope and the emperor, the latter resigning his pretensions on Rome and yielding all that he had denied to Adrian. And by the treaty of Venice (1st of August 1177) the antipope was forsaken, Alexander III. recognized and hailed as the legitimate pontiff, and the prefect of Rome again nominated by the pope, to whom the emperor restored the temporal power, acknowledging him the independent sovereign of Rome and of the ecclesiastical state, from Acquapendente to Ceprano. Frederick's troops accompanied the pope to Rome, where the republic was forced to make submission to him. By its strength, its surrender wore the aspect of a voluntary concession, and its terms began with these words: "Tutius populi Romani consilio et deliberatione statutum est," &c. The senators, elected yearly in September, had to swear fealty to the pope, and a certain proportion of nobles was included in their number. On his return to Rome, Alexander received a solemn welcome from all, but he had neither extinguished nor really subdued the republic. On the contrary, men's minds were more and more inflamed by the example of freedom displayed in the north of Italy. He died on the 30th of August 1181. The fact that between 1181 and 1187 there were three popes always living in exile proves that the republic was by no means crushed. During the same period another blow was inflicted on the papacy by the marriage of Henry VI., son and successor to Frederick I., with Constance, sole heiress of the Norman line in Naples. For thus the kingdom was joined to the empire, and the popes were more than ever in the latter's power. On the 20th of December 1187 Clement III. (1187-91), being raised to the pontificate, made a solemn agreement with the government of the Capitol before coming to Rome. And this peace of concordia had the air of a treaty between potentates of equal importance. Rome confronted the pope from the same standpoint from which the Lombard cities had confronted the emperor after Legnano. This treaty, the basis of the new constitution, was confirmed on the last day of May 1188 (Anno XLIV. of the senate). It begins with these words: "Concordia inter Dominum Papam Clementem III. et senatores populumque Romanum super regalibus et aliis dignitatis urbis." The pope was recognized as supreme lord, and invested the senators with their dignity. He resumed the privilege of coinage, but allowed one-third of the issue to be made by the senate. Almost all the old pontifical rights and prerogatives were restored to him. The pope might employ the Roman militia for the defence of his patrimony, but was to furnish its pay. The rights of the church over Tivoli and Tuscum were confirmed; but the republic reserved to itself the right of making war on those cities, and declared its resolve to dismantle and destroy the walls and castle of Tuscum. This undertaking the pope was to co-operate with the Romans, even should the unhappy city make surrender to him alone.

From all this it is clear, that the church had been made independent of the empire, and that the republic, despite its numerous concessions, was by no means subject to the church. The pope, in fact, had obtained liberty of election, and Frederick I., by resigning the investiture of the prelates, had virtually renounced his claim to temporal power in Rome. The republic had no patrician nor any other imperial magistrate, and preserved its independence even as regarded the pope, who merely granted investiture to magistrates freely chosen by the people, and had no legislative nor administrative power in the city. His temporal dominion was limited to his great possessions, to his regalia, to a supreme authority that was very indefinite, and to a feudal authority over the barons of the Campagna and many other states that had lost their last point of dissolution. The senate continued to frame laws, to govern, and to administer justice. The army carried on the wars of the republic, as we see by the tragic fate of Tuscum, which was razed to the ground on the 10th of April 1191. Thus the powerful counts of Tuscum disappeared; they sought refuge in the Campagna, and according to all probability the no less potent family of the Colonna sprang from their line. In consequence of these events, the nobles realized that the papacy sought to reduce them to vassalage. And, seeing that the republic remained firmly established and able to help them, they began to adhere to it and succeeded in obtaining admission to the new senate. In fact, whereas in 1143 plebeians and petty nobles had prevailed in its ranks, nobles of ancient descent are now found outnumbering the knights and burgurers. But in 1194 this state of things caused a sudden popular outbreak which abolished the aristocratic state and gave the headship of the republic to a single senator, summus senator, named Benedetto "Carissimus" or "Carus Homo" or "Carosomo," of unknown, but undoubtedly plebeian, origin. During the two years he remained in office this personage stripped the pope of his power, deposed the nobles, disbanded the judicati, even to the provinces, and with the aid of the parliaments and other popular assemblies promulgated laws and statutes. But he was overthrown by a counter-revolution, and Giovanni Capocci of the party of the nobles became senator for two years, and had been succeeded by one of the Pierleoni when, in 1197, a fresh revolution re-established a senate of fifty-six members, chiefly consisting of feudal barons in high favour with Henry VI., who had revived the imperial faction in Rome. But this emperor's life ended the same year as the pope's; in 1198, the seneschal, Innocent III. (1198-1216), began to make war on the nobles, who were again masters of the republic. Their leader was the prefect Pietro di Vico. Owing to the revolution of 1143, most of the prefectoral attributes were now vested in the senate; nevertheless, Pietro still retained a tribunal of police both within and without the
city. But his main strength was derived from the vast possessions of the Vico family, in which the office of prefect now became hereditary. Very soon, however, these prefects of Vico were chiefly regarded as the great feudal lords of Tuscia, and the independent municipal office lost its true character. Then the popes made a point of according great pomp and dignity to this nominal prefect, in order to overshadow the senator, who still represented the independence of the republic and had assumed many of the attributes wrested from the prefect.

But Innocent III., dissatisfied with this state of things, contrived by bribing the people to arrogate to himself the right of electing the senator, who had now to swear fealty and submission to the pope, and also that of nominating the provincial justiciar, formerly chosen by the government of the Capitol. This was a deadly blow to the republic, for the principal rights of the people—i.e. the election of pope and emperor, prefect and senate—were now lost. The general discontent provoked fresh revolutions, and Innocent III. employed all his political dexterity to ward off their effects. But shortly afterwards the people made a loud outcry for a senate of fifty-six members; and the pope, again making a virtue of necessity, caused that number to be chosen by twelve mediatori specially named by him for the purpose. Even this did not calm the popular discontent, which was also stirred by other disputes. The consequence was that when, six months later, the pope again elected a single senator the Romans rose to arms, and in 1204 formed a government of "Buoni Uomini" (Uomini de propria mano) to that created by the pope. But an amicable arrangement being concluded, the pope once more nominated fifty-six senators; and when, soon after, he again reduced them to one, the people were too weary to resist (1205). Thus the Capitol was subdued, and Innocent III. spent his last years in tranquillity.

On the 22nd of November 1220 Honorius III. (1216–27) conferred the imperial crown on Frederick II., who confirmed to the church the possession of her former states, of those bequeathed to her by Countess Matilda, and even of the March of Ancona. But it was soon seen that he sought to dominate all Italy, and was therefore a foe to be dreaded. The successor of Honorius, Pope Gregory IX. (1227–41), was specially insulted and put to flight by the Ghibelline nobles, whose courage he revived, and the republic began to subdue the Latian cities on its own account.

Peace was several times made and unmade by pope and people; but no enduring harmony was possible between them, since the former wished to subject the entire state to the church, and the latter to escape from the rule of the church and hold sway over "the universal land from Ceprano to Radiofani" formerly belonging to the duchy. Accordingly, the Roman people now appointed judges, imposed taxes, issued coin, and made the clergy amenable to secular tribunals. In 1234 the senator Luca Savelli published an edict declaring Tuscia and Campania territories of the republic, and sent judges thither to exact an oath of obedience. He also despatched the militia, which, when it had erected castles; and columns were raised everywhere inscribed with the initials S. P. Q. R. The pope, unable to prevent but equally unable to tolerate these acts, fled from Rome, hurling his anathema against Savelli, "et omnes illos consiliarios urbis quorum consilio," &c. The Romans sacked the Lateran and the houses of many cardinals, and marched on Viterbo, but were driven back by the papal troops.

When Savelli left office and Angelo Malabranca was elected in his stead, the people made peace and submission in 1235, and were obliged to give up their pretensions of subjecting the clergy to ordinary tribunals and the urban territory to the republic. Thus matters were virtually settled on the footing established by Innocent III., thanks to the aid given to the pope by Frederick II., who had been one of the promoters of the rebellion.

| The office of prefect becomes hereditary. | The republican regalia: independence. |
| City of Rome, 1222. | The republic submits to the people. |
| It may appear strange that, at this period of their history, the Romans, after showing such tenacious adherence to the republic and senate, should have accepted the rule of a single senator without rushing to arms, and passed and repassed from one form of government to another with such surprising indifference. But on closer examination it is plain that these changes were greater in appearance than reality. We have already seen, in treating of Carosino, how the single senator provoked the people in parliament to pass sanction on the laws. But, whenever there is only one senator, we also continually meet with the expression "consilium vel consilia urbis." It is evident that, instead of laws to be approved in parliament by a simple placet or rejected by a non-placet, matters requiring consultation had to be discussed, the senator convoked a much smaller council, consisting only of the leaders of the people. These leaders were the heads of the twelve or thirteen regions of the guilds, now becoming organized and soon to be also thirteen in number, and of the militia. As in the other Italian republics, all these associations had been formed in Rome. The senator therefore held consultation with the leading men of the city; and, although, especially at first, these meetings were rather loosely organized, it is clear that they took the form of two councils—one numerous (consiglio maggiore), the other limited (consiglio minore ore speciale), co-operating with and forming part of the first. Such was the prevailing custom throughout Italy at the time when Roman institutions most nearly resembled those of the other republics. We already know that, from the date of Arnold's reforms, the senate, with its junta of counsellors, had been divided into two parts, forming when united a species of greater council. Therefore the transition from a senate divided into two parts to the greater and lesser councils must have been very easy and natural. And, seeing that later, when the nomination of a single senator had become a constant practice, the meetings of the two councils are frequently mentioned without the slightest remark or hint as to their origin, it is clear that they had been gradually formed and long established. Not long after the revolution of 1143 the grandees sought to re-enter the senate; and the popes themselves, partly from dread of the people and partly to aggrandize their own kindred, concurred in the innovation. When the matter was discussed, the senator convoked a much smaller council, consisting only of the leaders of the people. These leaders were the heads of the twelve or thirteen regions of the guilds, now becoming organized and soon to be also thirteen in number, and of the militia. As in the other Italian republics, all these associations had been formed in Rome.

The Roman states. | Forme

Thus, after a long series of frequent changes and revolutions, the Roman republic became a commonwealth, with an increasing resemblance to those of the other Italian cities. The people were organized and armed, the gilds almost established, the two councils gradually constituted, and the aristocracy, while retaining special local characteristics, assumed its definitive shape. It is not surprising to find that Rome, like other Italian cities, now possessed statutes of its own. There has been much controversy on this point. Certain writers had alluded to a statute of 1246. As no one, however, could discover any statute of that date, others decided that it had never existed. A statute of 1363
was recently published by Professor Camillo Re, who asserted it to be the first and most ancient, that Rome had possessed. But the still more recent researches of Messrs. La Mantia and Levi prove that Professor Re's assertions were somewhat too bold. There is certain evidence of a statutum senatus existing between 1212 and 1227, of a statutum vol capitulare senatores et vulnus of 1235, followed in 1241 by a statutum urbis. This brings us very near to the statute of 1246 mentioned by Vitale and others. So it is well ascertained that, in the first half of the 13th century, Rome possessed statutes at large composed of older limited statutes. The consuls of the trade guilds were from 1267 regular members of the councils; and the merchants' guild held general meetings in 1255. Its statutes were confirmed in 1296 by the senator Pandolfo Savelli, and the compilation of these, published in 1880 by Signor Gatti, refers to 1327.

Meanwhile the struggle between Frederick II. and the pope was once more renewed. The former sought to dominate Italy, separate the state from the church, and repress the republics. The latter, although really hostile to the Roman free government, joined it against the emperor, who on his side favoured the republics of Rome and the Ghibelline party, and was at enmity with the pope. Thus the nobility, composed as we have seen, of two different elements, was again split into a Guelph party headed by the Orsini and a Ghibelline party under the Colonna. And in 1238 it was deemed advisable to elect two senators instead of one, in the hope of conciliating both factions by simultaneously raising them to power. Afterwards one only was elected, alternately an Orsini and a Colonna, then again two, and so on. But all these changes failed in their aims, since the struggle between emperor and pope exasperated party feeling in Rome. Frederick was king of southern Italy and emperor; had he been able to enforce the whole of his authority he would have been absolute master of all Italy, a state of things which the popes could not in any way tolerate. Hence the obstinate and uninterrupted struggle which proved injurious both to the papacy and the empire. The political genius of Frederick might have wrought great harm to the city had not his mind teemed with contradictory ideas. Although desirous to emancipate the state from the church, he fervently opposed the separation of church and state, which was then the chief strength of the secular state in Italy. While combating the church and persecuting her defenders, he yet sent heretics to the stake; although excommunicated, he undertook a crusade; he feasted at his table philosophers, sceptic and atheist poets, bishops and Mussulmans; he proclaimed anti-Christian the possession of wealth by the church, yet made lavish gifts to altar and monastery. Thus, although he had a strong party in Rome, it seemed to dissolve at his approach, inasmuch as all feared that he might abolish the statutes and liberties of the commune. In fact, when he advanced towards Rome on the death of Gregory IX. in 1241 he was energetically repulsed by the people, and later even by Viterbo, a city that had always been faithful to him. But after he had withdrawn, his adherents gained strength and put to flight his opponent, Innocent IV. (1243-54), the newly elected pope, who then from his asylum at Lyons hurled an excommunication against him. Frederick's death in December 1250 determined the fall of the Ghibelline party and the close of the imperial epoch in Italy. The pope instantly returned to Rome with the set purpose of destroying the power of the Hohenstaufens. This was no longer difficult when, by the decease of Conrad IV. (1254), the child Conradin became the last legitimate representative of that line, and negotiations were already on foot for placing the Angevins on the Neapolitan throne.

The republic meanwhile preserved its independence against the pope, who, among other concessions, had entirely given up to it the right of coinage. Nevertheless, being much harassed by the factiousness of the nobility, it was obliged in 1252 to decide on the election of an alien senator armed with ample powers, precisely as other communes gave the government into the hands of a podestà. Accordingly a Bolognese noble, Brancalone degli Andalò, count of Casalecchio, and a Ghibelline of much energy and talent, was invited to Rome. But before accepting office he insisted on making definite terms. He desired to hold the government for three years; and this, although contrary to the statutes, was granted. Further, to ensure his personal safety, he demanded that many scions of the noblest Roman houses should be sent as hostages to Bologna; and to this also the republic consented. Then, in August 1252, he came with his judges and notaries, made oath to observe justice and the laws, and began to govern. He was head of the republic in peace and war, supreme judge and captain in chief. He nominated the podestàs of subject territories, despatched ambassadors, issued coin, concluded treaties and received oaths of obedience. The pope, who was then at Perugia, was greatly afflicted by the arrival of this new master, but, desiring of aid from any quarter, was forced to make a virtue of necessity. Thus Brancalone was able to seize the reins of power with a firm grasp. The parliament still met in the square of the Capitol, and the greater and lesser councils in the church of Ara Coeli. There were besides frequent assemblies of the council of capitaneo and senatus.

Unfortunately, no records having been preserved of the proceedings of the Roman councils and parliament, little can be said of the manner in which affairs were conducted. Certainly Brancalone's government was not very parliamentary. He convoked the councils as seldom as was possible, although he frequently assembled the people in parliament. The chief complaint made against him was of undue severity in the administration of justice. He rendered the clergy amenable to secular tribunals, subduing the neighbouring cities of Tivoli, Palestrina, &c., and commanded in person the attacking force. But his greatest energy was directed to the repression of the more turbulent nobles who were opposed to him; and he soon made them feel the weight of his hand by hanging some, banishing others, and persecuting several more. But he too recognized the expediency of winning the popular favour. He was the first senator to add to his title that of captain of the people ("Almae Urbis Senator III; et Romani Populi Capitanæus"). He proposed to the people, by promoting the organization of guilds after the model of those which already existed in Italy, that they should be organized under a podestà. Three hundred were already a few in Rome, such as the merchants' guild and that of the agriculturists, Bobatorium or Botavarti, who must have resembled the so-called mercanti di compagnia or graziers of the present day, since no peasant guild existed in Italian republics. The merchants' guild, definitely established in 1255 under Brancalone's rule, had four consuls and twelve councillors, held meetings and made laws. The other guilds, thirteen in all, were organized much on the same plan. The admission of their heads into the councils of the republic in 1267 shows how efficaciously their interests had been promoted by Brancalone.

The death of Innocent IV. and the election of Alexander IV. (1254-61), who was milder and less shrewd than his predecessor, were favourable events for Brancalone; but he failed to check the growing discontent of the clergy and the more powerful nobles, who had received deadly injuries at his hands. And when, on the expiration of his three years' term of office, his "election was proposed, his enemies rose against him, accused him before the sindacato, threw him into prison, and vehemently protested against the continuance of "foreign tyranny." His life was only spared on account of the hostages sent to Bologna. The next senator chosen was a Brescian Guelph, Emanuele de Madio, a tool of the nobles, who were now masters of the situation. But soon afterwards, in 1257, the gilds rose in revolt, drove the nobles from power, put the pope to flight, and recalled Brancalone for another three years' term. He ruled more sternly than before, hung several nobles, and made alliance with Manfred, the representative of the Swabian party in Italy. This rendered him increasingly odious to the pope and procured his excommunication. But, disregarding the
thunders of the church, he marched against Anagni, the pope's birthplace, and Alexander was quickly obliged to humiliate himself before the senator of Rome. Brancalone next set to work to destroy the fortified towers of the nobility, and in razing them to the ground ruined many of the adjacent dwellings. Accordingly, a considerable number of nobles became homeless exiles. In 1258, while engaged on the siege of Corneto, Brancalone was attacked by a violent fever, and, being carried back to Rome, died on the Capitoline Hill. Thus ended the career of a truly remarkable statesman. He was succeeded by his uncle, Castellano degli Andalò, who, lacking the political genius of his nephew, only retained office until the following spring (1259), in the midst of fierce and perpetual disturbances. Then the people, being bribed by the pope, joined with the nobles and drove him away. His life too was saved by having followed his nephew's shrewd plan of sending hostages to Bologna. Two senators of Roman birth were next elected; and on the death of Alexander IV. a French pope was chosen, Urban IV. (1261-64), thus giving fresh predominance in the church to the anti-Swabian policy. But the internal disturbances of the city soon drove Urban to flight.

At this period both fall of the empire had induced many Italian republics seek strength by placing their governments in the hands of some prince willing to swear respect to their laws and to undertake their defence against neighbouring states and the pope. In Rome the Guelphs and Ghibellines proposed various candidates for this office, and after many fierce quarrels ended by electing a committee of boni homines, charged with the revision of the statutes, reorganization of the city, and choice of a senator. This committee sat for more than a year without nominating any one, so, the Guelph party being now predominant, and all being weary of this provisional state of things, the majority agreed on the election as senator of Charles of Anjou, who, at the pope's summons, was already preparing for the conquest of Naples. The Romans thought that he would defend Rome against the pope, and the pope would defend Rome against him; and by thus taking advantage of either's jealousy the citizens hoped to keep their republican integrity. In fact, although Urban IV. had incited Charles to attack Naples, he was by no means willing to see him established as master in Rome. He accordingly declared that, if Charles really wished to obtain the Neapolitan crown, he must only accept the offer of dignity presented to him; and came to Rome for the purpose of demanding and he must likewise promise to recognize the supremacy of the pope over the senate. Charles soothed him with the most solemn verbal promises, but in fact accepted the senatorship for life. In 1265, when Urban was succeeded by Clement IV. (1265-68), who as a Provencal was a subject of Charles, the latter entered Rome and was immediately made senator. Seven days later (28th of June) he received the investiture of the Neapolitan kingdom, and in the following January its crown. On the 26th of February 1266 the battle of Benevento was fought, and, the valiant Manfred being killed, the triumph of the Guelph Angevins in Italy was assured. Then, at the urgent command of the pope, Charles was forced to resign the senatorship in the May of the same year. Two Romans were elected in his stead, but soon fell out with the pope, because the Guelph nobles again tried to exercise tyranny. The people, however, profited by these disturbances to rise on its own account, and formed a democratic government of twenty-six boni homines with Angelo Capocci, a Ghibelline, as its captain. By this government Don Henry, son of Ferdinand III. of Castile, was elected seneschal; and he came to Rome for the purpose of promoting a Ghibelline and Swabian policy in favour of Conradin, who was preparing for conflict. The rule of the new senator was very energetic, for he kept down the clergy, subdued the Campagnia, persecuted the Guelph nobles, made alliance with the Tuscan Ghibellines, forcibly drove back the troops of King Charles, who was advancing towards Rome, and gave a splendid reception to Conradin. But the battle of Tagliacozzo (23rd of August 1268), followed by the murder of Conradin, proved fatal to the Ghibelline party. Charles was re-elected senator immediately after the battle, and the pope confirmed his powers for a term of ten years, after having already named him imperial vicar in Tuscany. On the 10th of September Charles for the second time took possession of the Capitol, and ruled Rome firmly by means of vice-governors or vicars.

The Swabian line was now extinct, and in Charles's hands the Neapolitan kingdom had become a fief of the church. The empire had fallen so low as to be no longer formidable. Now therefore was the moment for treating with it in order to restrain Charles, and also for making use of the French king to keep the empire in check. And this was the policy of Nicholas III. (1277-80), who hastened to extract advantageous promises from Rudolph of Habsburg, the new candidate for the imperial crown. In 1278, the ten years' term having expired, he deprived Charles of the senatorship and appointed Rudolph vicar of Tuscany. After declaring that he left to the people the right of electing the senator, he promulgated a new constitution (18th of July 1278) which, while confirming the rights of the church over the city, prohibited the election of any foreign emperor, prince, marquis, count or baron as senator of Rome. Thus the Colonna, Savelli, Orsini, Annibaldi and other Roman nobles again rose to power, and the republic was again endangered and plunged into disorder. The reconstitution of the city into the pope's hands by yielding to him the right of nominating senators, declaring, however, that this was a personal concession to himself, and not to the popes in general. So Nicholas proceeded to name senators, alternating a Colonna with an Orsini, or simultaneously choosing one of each faction. The same power over the senate was granted with the same restriction to Martin IV. (1281-85), and he at once re-elected Charles of Anjou. Thus, greatly to the disgust of the Romans, the Capitol was again invaded by French vicars, notaries, judges and soldiery. But the terrible blow dealt at Charles's power by the Sicilian Vespers (31st of March 1282) resounded even in Rome. The Orsini, backed by the people, rose to arms, massacred the French garrison, and quickly re-established a popular government. Giovanni Cencio, a kinsman of the Orsini, was elected captain and defender of the people, and ruled the city with the co-operation of the senator and a council of priors of the guilds. This government was of brief duration, for, although the pope had professed his willingness to tolerate the election of a popular candidate, he refused to accept the terms, and, forking Charles of Anjou, again nominated two Roman senators. Pope and king both died in 1285, and Nicholas IV. (1288-92), also holding sway over the senate, favoured the Colonna in order to curb the growing mastery of the Orsini. But thus there were two powerful houses instead of one. In fact, Giovanni Colonna, when elected senator, ruled from the Capitol as an independent sovereign, conducted in person the campaign against Viterbo, and subjected that city to the republic on the 3rd of May 1291.

When one of the Gaetani, Boniface VIII. (1294-1303), was raised to the papal chair, the extent of the Colonna's power became evident to all. Boniface opposed them in order to aggrandize his own kin, and they showed equal virulence in return. The Cardinals Colonna refused to acknowledge him as the legitimate pope, and he excommunicated them and proclaimed a crusade against their house. Even after he had subdued them and destroyed Palestrina, their principal fief, the drama did not yet come to an end. Boniface had a very lofty conception of the church, and, to establish her supremacy over arranged with the king of France (Philip the Fair) believed, on the contrary, that the Angevin successes entitled him to fill the place in Italy vacated by the Swabians, and to play the master there. This led to a tremendous contest in which all the French sided with their king. And shortly afterwards a plot was hatched against the pope by the agents of France and the Colonna. These determined enemies of the pope met with much favour in Rome, on account of the general irritation against the Gaetani and the enormous power conferred on them by Boniface.
 Suffice it to say that they were now lords of the whole of lower Latium, from Capo Circce to Ninfa, from Ceprano to Subiaco. Thus Sciarra Colonna and a Frenchman named Nogaret were able to fall on the pope at Anagni, insult him, and take him prisoner. The people rising to his rescue, the conspirators were put to flight. But when Boniface returned to Rome with the escort and protection of the Orsini, who had made themselves masters of the city, he found that he was virtually a captive in their hands. He felt this so keenly that he died of rage and exhaustion on the 11th of October 1303. The brief pontificate of his successor Benedict XI. was followed by that of Clement V. (1305-14), a Frenchman, who, instead of coming to Rome, summoned the cardinals to France. This was the beginning of the church's so-called exile in Avignon, which, although depriving Rome of a scoure of wealth and influence, left the republic to pursuit its own course. It employed this freedom in trying to hold its own against the nobles, whose power was much lessened by the pope, and endeavoured to gain fresh strength by organizing the thirteen regions, which, as we have shown, were associations of a much firmer nature in Rome than the gilda. Accordingly, in 1305, a captain of the people was elected with thirteen elders and a senator, Paganino della Torre, who governed for one year. The pope was opposed to these changes at first, but in 1310 he issued a brief granting Rome full permission to select its own form of government. Thus, the first pope in Avignon restored the rights of the Romans. But the latter, even with church and empire so far removed, still considered Rome the Eternal City, the source of all law, and the only natural seat of the spiritual and temporal government of the world. To their republic, they thought, appertained a new and lofty destiny, nor could it ever be content to descend to the level of other Italian municipalities.

The republic again takes a democratic form.

The 6th of January 1309 Henry VII. was crowned king of the Romans at Aix-la-Chapelle; and so greatly were men's minds changed in Italy that, throughout the land, he was hailed as a deliverer. He wished to restore the grandeur of the empire, and the Italians, above all Dante Alighieri, beheld in him the champion of the state against the church, who, after becoming the foe of communal liberty, had forsaken Italy and withdrawn to France. The Roman people shared these ideas, and awaited Henry with equal impatience, but the nobles rose in opposition. The Orsini, leaders of the Guelphs, and allied with Robert of Naples, took possession of the castle of St. Angelo and the Trastevere. Hence, when Henry reached Rome in May 1312, after seizing the iron crown at Milan, he was obliged to act on the offensive. He took the Capitol by assault, but, failing in his attack on the castle of St. Angelo, was pursued by its Neapolitan garrison. Forsaken by many discouraged adherents, he was forced to recognize the expediency of departure. First, however, he desired to be crowned at the Lateran, St. Peter's being held by his foes. The cardinals refused his request, but were compelled to yield by the threats of the people, who, reassessing their ancient rights, insisted that the coronation should take place without delay. And the ceremony was performed on the 29th of June 1312. The emperor then resolved to depart in spite of the popular protest against his leaving the natural seat of the empire, and on the 10th of August started for Tuscany, where worse fortune awaited him.

Their differences settled, the nobles expelled the captain of the people left by Henry, and elected as senators Sciarra Colonna and Francesco Orsini. But this was the signal for a popular revolt. The Capitol was attacked, the senators put to flight, and Jacopo Arlotti elected captain with a council of twenty-six worthies (buoni homini). The new leader instantly summoned the chief nobles before his tribunal, had them chained and cast into prison, and demolished many of their houses and strongholds. But, having thus humiliated their pride, Arlotti dared not put them to death, and, releasing them from confinement, banished them to their estates, where they plunged into hostile preparations. Meanwhile the victorious people convoked a parliament and decreed that, the aristocracy being now overthrown, the tribunitia potestas alone should invite the emperor to make his triumphal entry into the Capitol, and receive his authority from the people of Rome. This conception of the Roman power will now be seen to become more and more definite until finding its last expression in Cola di Rienzi. Pope Clement, resigning himself to necessity, acknowledged the new government under the energetic rule of Arlotti. The latter now joined the Ghibellines of the Campagna against the Orsini and the Neapolitans, subdued Velletri, and gave it a podestà. But then the Gaetani, who were Guelphs, united with the Orsini and the Neapolitans, and, giving battle to the Ghibellines in the Campagna, routed them in such wise as to put an end to the popular government. The nobles forced their way into the city, attacked the Capitol, made Arlotti their prisoner, and re-elected the senators Sciarra Colonna and Francesco Orsini. Close upon these reverses came the death of Henry VII. (24th of August 1313) at Buonconvento near Siena, which put an end to the Ghibelline party in Italy. Thereupon King Robert of Naples, being named senator by the pope, immediately appointed a vicar in Rome. Clement likewise profited by the vacancy of the imperial throne to name the king imperial vicar in Tuscany. And he died on the 26th of April 1314, well content to have witnessed the triumphs of the Guelphs in Italy.

Affairs took a fresh turn under Pope John XXII. (1316-34). Rome was still ruled by the vicars of King Robert; but, owing to the continued absence of the popes, matters grew daily worse. Trade and industry declined, revenue diminished, the impoverished nobles were exceedingly turbulent, deeds of murder and violence occurred on all sides; even by day the streets of the city were unsafe. Hence there was universal discontent. Meanwhile Louis the Bavarian, who in 1314 had been crowned king of the Romans, having overcome his German enemies at Mühlord in 1322, turned against the pope, one of his fiercest opponents. Louis was surrounded by Minorite friars, supporters of the poverty of the church, and consequently enemies to the temporal power. They were men of the stamp of William of Occam, Marsilio of Padua, Giovanni Janduno, and other philosophers favourable to the rights of the empire and the people. Accordingly the Italian Ghibellines hailed Louis as they had previously hailed Henry. Even the Roman people were roused to action, and, driving out the representatives and partisans of King Robert, in the spring of 1327, seized on the castle of St. Angelo, and again established a democratic government. "Nearly all Italy was stirred to new deeds," says G. Villani, "and the Romans rose to arms and organized the people" (bk. x. c. 20). Regardless of the reproofs of the pope, they elected a haughty Ghibelline, Sciarra Colonna, captain of the people and general of the militia, with a council of fifty-two popolani, four to each region. Then, ranged under the standards of the militia, the Romans gave chase to the foes of the republic, and Sciarra, returning victoriously to the Capitol and invited Louis the Bavarian to Rome. The summons was obeyed; on the 7th of January 1328 the king was already encamped in the Neronian Fields with five thousand horse and a considerable number of foot soldiers, and, with better fortune than Henry VII., was able to enter the Vatican at once.

Encircled by a crowd of heretics, reformers and Minorite brethren, he convoked a parliament on the Capitol, asking that the imperial crown might be conferred upon him by the people, from whom alone he wished to receive it. And the people proclaimed him their captain, senator and emperor. On the 17th of January his coronation took place in St. Peter's. But, as he had neither money nor practical sense, his method of taxation and the excesses committed by himself and his over-excited philosophers speedily aroused the popular discontent. His ecclesiastical vicar, Marsilio of Padua, and
RECONSTITUTION

of the republic.

Shortly before this another revolution in Rome had re-established the government of the thirteen elders and two senators. The people, being anxious to show their intention of respecting the papal authority, had despatched to Avignon as ambassador of the republic, in 1343, a man destined to make much noise in the world. This was Cola di Rienzi, son of a Roman innkeeper, a notary, and an impassioned student of the Bible, the fathers, Livy, Seneca, Cicero, and Valerius Maximus. Thoroughly imbued with a half pagan, half Christian spirit, he believed that he had a divinely inspired mission to revive the ancient glories of Rome. Of handsome presence, full of fantastic eloquence, and stirred to enthusiasm by contemplation of the ruined monuments of Rome, he harangued the people with a stilted oratory that enchanted their ears. He hated the nobles, because one of his brothers had been killed by them; he loved the republic, and in its name addressed a stately Latin speech to the astonished pope, and, offering him the supreme power, besought his instant return to Rome. He also begged him to allow the city to celebrate a jubilee every fifty years, and then, as a personal request, asked to be nominated notary to the urban chamber. The pope consented to everything, and Rienzi communicated this good news. Rienzi returned to Rome, and, after the downfall of the democratic government, Bertoldo Orsini, who had returned to Rome with his Guelphs, and Stefano Colonna were elected senators, and confirmed in the office by Cardinal Giovanni Orsini in the name of the pope. A new parliament cancelled the emperor’s edicts, and had them burnt by the public executioner. Later, Nicholas, the antipope, went with a rope about his neck to make submission to John XXII., and Louis promised to disavow and retract all that he had done against the church, provided the sentence of excommunication were withdrawn. This, however, was refused. Never had the empire fallen so low. Meanwhile King Robert was again supreme in Rome, and, being re-elected senator, appointed vicars there as before. Anarchy reigned. The city was torn by factions, and the provinces rebelled against the French representatives of the pope, who, in their ignorance of Italian affairs, were at a loss how to act.

And after the election of Benedict XII. (1334-44) confusion reached so great a pitch that, on the expiration of Robert’s senatorial term, the Romans named thirteen heads of state to complete his term with two senators, while the king still sent vicars as before. The people, for the sake of peace, once more granted the supremacy of the senate to the pope, and he nominated two knights of Gubbio, Giacomo di Cante dei Gabrielli and Bosone Novello dei Gabrielli, who were succeeded by two other senators the following year. But in 1339 the Romans attacked the Capitol, named two senators of their own choice, re-established a democratic government, and sent ambassadors to Florence to ask for the ordinances of justice (ordinamenti della giustizia), by which that city had broken the power of the nobles, and also that a few skilled citizens should lend their help in the restoration of Rome. Accordingly some Florentines came with the ordinamenti, some portions of which may be recognized in the Roman statutes, and, after first rearranging the taxes, elected thirteen priors of the guilds, a gonfalonier of justice, and a captain of the people after the Florentine manner. But there was a dissimilarity in the conditions of the two cities. The guilds having little influence in Rome, the projected reform failed, and the people being helpless, the senators and knights were shaken. Thereupon public discontent swelled, and especially when, by the foundation of the papal palace of Avignon, it was evident that Benedict XII. had no intention of restoring the Holy See to Italy. This pope was succeeded in 1342 by Clement VI. (1342-52), and King Robert in 1343 by his niece Joanna; and the latter event, while plunging the kingdom in anarchy, likewise aggravated the condition of Rome. For not only were the Neapolitan sovereigns still very powerful there, but the principal Roman nobles held large fiefs across the Neapolitan borders.

Giovanni Janduno placarded the walls with insulting manifestoes against the pope, whom the Minorites stigmatized as a heretic and wished to depose. In April Louis twice assembled the parliament in St Peter’s Square, and, after obtaining its sanction to several anti-papal edicts, declared John XXII. degraded and deposed as a heretic. This was a very strange and novel spectacle, the more so that, as was speedily proved, the Romans were stirred by no anti-Catholic spirit, no yearning for religious reform. Jacopo Colonna, a canon of the Lateran, was able to make his way into Rome with four masked companions, to publicly read, at the top of his voice and before a great multitude, the excommunication launched against the emperor by the deposed pope, to traverse the entire city, and to withdraw unmolested to Palestrina. Meanwhile the emperor contented himself with decreeing that henceforth the popes must reside in Rome,—that if, when invited, they should fail to come they would be thereby held deposed from the throne. As a logical consequence, proceedings were immediately begun for the election of the new pope, Nicholas V., who on the 12th of May was proclaimed by the popular voice in St Peter’s Square, and received the imperial sanction. But this ephemeral drama came to an end when the emperor departed with his anti-Catholic supporters. And now the downfall of the democratic government. Bertoldo Orsini, who had returned to Rome with his Guelphs, and Stefano Colonna were elected senators, and confirmed in the office by Cardinal Giovanni Orsini in the name of the pope. A new parliament cancelled the emperor’s edicts, and had them burnt by the public executioner. Later, Nicholas, the antipope, went with a rope about his neck to make submission to John XXII., and Louis promised to disavow and retract all that he had done against the church, provided the sentence of excommunication were withdrawn. This, however, was refused. Never had the empire fallen so low. Meanwhile King Robert was again supreme in Rome, and, being re-elected senator, appointed vicars there as before. Anarchy reigned. The city was torn by factions, and the provinces rebelled against the French representatives of the pope, who, in their ignorance of Italian affairs, were at a loss how to act.

And after the election of Benedict XII. (1334-44) confusion reached so great a pitch that, on the expiration of Robert’s senatorial term, the Romans named thirteen heads of state to complete his term with two senators, while the king still sent vicars as before. The people, for the sake of peace, once more granted the supremacy of the senate to the pope, and he nominated two knights of Gubbio, Giacomo di Cante dei Gabrielli and Bosone Novello dei Gabrielli, who were succeeded by two other senators the following year. But in 1339 the Romans attacked the Capitol, named two senators of their own choice, re-established a democratic government, and sent ambassadors to Florence to ask for the ordinances of justice (ordinamenti della giustizia), by which that city had broken the power of the nobles, and also that a few skilled citizens should lend their help in the restoration of Rome. This pope was succeeded in 1342 by Clement VI. (1342-52), and King Robert in 1343 by his niece Joanna; and the latter event, while plunging the kingdom in anarchy, likewise aggravated the condition of Rome. For not only were the Neapolitan sovereigns still very powerful there, but the principal Roman nobles held large fiefs across the Neapolitan borders.
Rienzi's deeds. The provincial cities did homage to Rome and her tribune, and almost all the rest of Italy gave him its enthusiastic adherence. The ancient sovereign people seemed on the point of resuscitation. And others besides the multitude were fascinated and carried off their feet. Great men like Petrarch were transported with joy. The poet lauded Cola di Rienzi as a sublime and supernatural being, the greatest of ancient and modern men. But it was soon evident that all this enthusiasm was mainly factitious. On the 26th of July a new parliament was called, and this decreed that all the rights and privileges granted to the empire and church must now be vested in the Roman people, from whom they had first emanated. But on the convocation of the national parliament few representatives obeyed the summons and the scheme was a failure. All had gone well so long as principles only were proclaimed, but when words had to be followed by deeds the municipal feeling awoke and distrust began to prevail. Nevertheless, on the 1st of August Rienzi assumed the spurs of knighthood and passed a decree declaring that Rome would now resume her old jurisdiction over the world, invoking the Holy Spirit upon Italy, granting the Roman citizenship to all her cities, and proclaiming them free in virtue of the freedom of Rome. This was a strange jumble of the ancient Roman idea combined with the mediaval. It was a dream of Rienzi's brain, but it was also the dream of Dante and Petrarch. The conception of the empire and the history of Italy, particularly that of ancient and medieval Rome, were inevitably preparing the way for the national idea. This Rienzi foresaw, and this constitutes the true grandeur of his character, which in other respects was not exempt from pettiness and infirmity. He pursued his course, therefore, undismayed, and had indeed gone too far to draw back. On the 1st of August he caused himself to be crowned tribune with great pomp, and confirmed the rights of Roman citizenship to all natives of Italy. But practical matters had also to be taken into account, and it was here that his weakness and lack of judgment was shown. The nobles gained the upper hand, and refused to yield to the charm of his words. Hence conflict was unavoidable; and at first Rienzi succeeded in vanquishing the Gaetani by means of Giovanni Colonna. He next endeavoured to suppress the Guelph and Ghibelline factions, and to restore Italy to "holy union" by raising her from her present abasement.

The pope, however, was weary of toleration and, and, coming to terms with the nobles, incited them to war. They accordingly moved from Palestrina, and on the 30th of November were encamped before Rome. Rienzi now put forth his energy. He had already called the militia to arms, and a genuine battle took place in which eighty nobles, chiefly of the Colonna clan, were left dead. This was a real catastrophe to them, and the aristocracy never again achieved the rule of the republic. But Rienzi's head was turned by this sudden success. In great need of money, he began to play the tyrant by levying taxes and exacting instant obedience. The papal legate saw his opportunity and seized it, by threatening to bring a charge of heresy against the tribune. Rienzi was dismayed. He declared himself friendly to the pope and willing to respect his authority; and he even sought to conciliate the nobles. At this moment certain Neapolitan and Hungarian captains, after levying soldiers with the tribune's consent, joined the nobles and broke out in revolt. On their proving victorious in a preliminary encounter with some of Rienzi's guards, the tribune suddenly lost heart, resigned the power he had held for seven months, and took refuge with a few trusty adherents in the castle of St. Angelo on the 13th December 1347. Thence he presently fled to Naples, vainly hoping to find aid, and afterwards disappeared for some time from the scene.

Meanwhile the Romans remained tranquil, intent on making merry by the jubilee, but no sooner was this over than disorders broke out, and the tyranny of the baronage recommenced. To remedy this state of things, application was made to the pope. He consulted with a committee of cardinals, who sought the advice of Petrarch, and the poet suggested a popular govern-
from Kienzi. But, whereas elsewhere tyrants were gradually arising in the citizen class, Rome was always in danger of being taken by the pope. Nor was any aid available from the empire, which had never recovered from its abasement under Louis the Bavarian. In fact, when Charles of Luxemburg came to Rome to be crowned, he was obliged to promise the pope that he would not enter the city. On Easter day 1355 he received the crown, and departed after counselling the Romans to obey the pope. And the pontiffs had greater need than ever of an established kingdom. Their position in France was much endangered by that country’s disorder. New states were being formed on all sides; the medieval unity was shattered; and the shrunken spiritual authority of the church increased her need of material strength. As Italian affairs stood, it would be easy for the popes to found a kingdom, but their presence was required in Rome before it could be firmly established. The blood-stained sword of Albornoz had prepared the way before them. In 1355-56 he vanquished the lords or tyrants of Rimini, Fano, Fossombrone, Pesaro, Urbino and other cities. And all these places had been so rudely oppressed that the cardinal was often hailed as a liberator after subduing their masters by fire and sword. But everywhere he had been obliged to leave existing governments and rulers in status quo after exacting their oaths of fealty. Thus the state was still dismembered, and it was impossible to bind it together with the pope at Avignon and Rome a republic. Bologna was still independent; Ordelaft still lord of Forli; Cesena and other cities were still rebellious; and the Campagna was still in the hands of the barons. Some places were ruled by rectors nominated by the pope; at Montefiascone there was an ecclesiastical rector, with a bench of judges, and a captain commanding a mixed band of adventurers. Rome had submitted to the haughty cardinal, but hated him mortally, and, on his departure for Avignon in 1357 to assist the threatened pontiff, immediately conceded to the latter the supremacy of the senate. And the pope, instead of two senators, hastened to name a single one of foreign birth. This was a shrewd device of Albornoz one another blow to the nobles, with whom he was still at war. Thus was inaugurated, by the nomination of Raimondo de’ Tolomei in 1358, a series of foreign senators, fulfilling the functions of a podestà, and changed every six months, together with their staff of judges, notaries and knights. The people approved of this reform as being inimical to the nobles and favourable to the preservation of liberty. Hitherto the senators had been assisted, or rather kept in check, by the thirteen representatives of the regions. These were now replaced by seven reformers, in imitation of the priors of Florence, the better to follow that city’s example. The reformers were soon the veritable chiefs of the republic. They first appeared in 1360, were either popolani or cavallerotti, and were elected by ballot every three months. When Albornoz returned to Italy, although desirous to keep Rome in the same subjection as the other cities, he had first to vanquish Ordelaffi and reduce Bologna. The latter enterprise was the more difficult task and provoked a lengthy war with Matteo Visconti of Milan. Thus Rome, being left to herself, continued to be governed by her reformers; and the nobles, already shut out from power, were also excluded from the militia, which had been reorganized, like that of Florence, on the democratic system.

The ban-deresi. Three thousand men, mostly archers, were enrolled under the command of two banderesi, “in the likeness,” says M. Villani, “of our gonfalonieri of the company,” with four antepossì constituting a supreme council of war. And the whole body was styled the “Felix Societas Balestrarianorum et Pavesatorum.” It was instituted to support the reformers and re-establish order in the city and Campagna, to keep down the nobles and defend the republic. It fulfilled these duties with much, and sometimes excessive, severity. Banderesi and antepossì had seats in the special council beside those of the reformers, as, in Florence, the gonfaloniers of the companies were seated beside the priors. Later these officials constituted the so-called signoria dei banderesti. In 1362, the Romans having subjected Velletri, which was defended by the nobles, the latter made a riot in Rome. Thereupon the banderesi drove them all from the city, killed some of their kindred, and did not even spare the cavalieri. The fight became so furious that from gate to gate all Rome was in arms, and even mercenaries were hired. But in the end renewed submission was made to the pope.

On the death of Innocent VI. in 1362, an agreement was concluded with his successor, Urban V. (1362-70), also a Frenchman, who was obliged to give his sanction to the government of the reformers and banderesti. And then, Albornoz being recalled in disgrace to Avignon, and afterwards sent as legate to Naples, these Roman magistrates were able, with or without the co-operation of the foreign senator, to rule in their own way. They did justice on the nobles by hanging a few more; and they defended the city from the threatening attacks of the mercenaries, who had now become Italy’s worst foes. It was at this period that the Roman statutes were revised and rearranged in the compilation erroneously attributed by some writers to Albornoz, which has come down to us supplemented by alterations of a later date.

But now the popes, being no longer in safety at Avignon, really decided to return to Italy. Even Urban V. had to pay ransom to escape from the threatened attacks of the free companies. The Romans implored his return, and he was further urged to it by the Italian literati, with Petrarch at their head. In April 1367 he finally quitted Avignon, and, entering Rome on the 16th of October, was given the lordship of the city. Cardinal Albornoz had fallen mortally ill at Viterbo, but, though unable to accompany the pope to Rome, had, before dying, suggested his course of action. Certainly Urban showed much acumen in profiting by the first burst of popular enthusiasm to effect quick and dexterous changes in the constitution of the republic. After naming a senator, he abolished the posts of reformers and banderesi, substituting three conservators, or rather a species of municipal council, alone charged with judicial and administrative powers, which has lasted to the present day. The thirteen leaders of the regions and the consuls of the gilds still sat in the councils, which were left unsuppressed. But all real power was in the hands of the pope, who, in Rome, as in his other cities, nominated the principal magistrates. Thus, by transforming political into civil institutions and concentrating the supreme authority in his own grasp, Urban V. dealt a mortal blow to the liberties of Rome. Yet he felt no sense of security among a people who, after the first rejoicings over the return of the Holy See, were always on the brink of revolt. Besides, he felt himself a stranger in Italy, and was so regarded. Accordingly, in April 1370 he decided to return to France; on the 20th of that month he wrote from Viterbo that no change was to be made in the government; and he died in Avignon on the 10th of December.

The Romans retained the conservators, conferring on them the political power of the reformers; they re-established the banderesi with the Florentine title of esecutore judiciae and the four antepossì with that of consiliarii. Thus the “Felix Societas Balestrarianorum et Pavesatorum Urbis” was restored, and the two councils met as before. The new French pope, Gregory XI. (1370-78), had to be content with obtaining supremacy over the senate and the possession of the castle of St Angelo. It was a difficult moment for him. The Florentines had come to an open rupture with his legates, and had adopted the expedient of inviting all the cities of the Roman state to redeem their lost freedom. Accordingly, in 1375 many of them rose against the legates, who were mostly French and regarded with dislike as foreigners. Florentine despaches, full of classical allusions and chiefly composed by the famous scholar Secretary Coluccio Salutati, were rapidly sent in all directions. Those addressed to the Romans were specially fervid, and emphatically appealed to their patriotism and memories of
the past. But the Romans received them with doubt and mistrust, for they saw that the revolution threatened to dismember the state, by promoting the independence of every separate city. Besides, while maintaining their republic, they also desired the pope's presence in Rome. Nevertheless, they went with the current to the extent of reforming their constitution. In February 1376 they nominated Giovanni Cenci captain of the people, and gave him uncontrolled power over the towns of the patrimony and the Sabine land. The conservators, with their new political authority, the executores, the antepositi and the two councils were all preserved, and a new magistracy was created, the "Tres Gubernatores Pacis et Libertatis Reipublicae Romanae." This answered to the Eight (afterwards Ten) of War in Florence, likewise frequently called the Eight of Liberty and Peace. It was this Council of Eight that was now directing the war against the pope and braving his sentence of excommunication; and their zealous had won them the title of the Holy Eight from the Florentines. Realizing that further absence would cost him his state, Gregory XI. quitted Avignon on the 13th of September 1376, and, reaching Corneto in December, despatched to Rome three legates, who, on the 21st of the month, concluded an agreement with the parliament. The people gave up the gates, the fortresses and the Trastevere, and promised that if the pope returned to Rome he should have the same powers which had been granted to Urban V. But, on his side, he must pledge himself to maintain the executores and their council, and allow the Romans the right of reforming the banaderesi, who would then swear fealty to him. The terms of this peace and the pope's epistles clearly prove that the two councils still exercised their functions, that the banaderesi were still the virtual heads of the government, and that their suppression was not contemplated. In fact, when the pope made his entry on the 17th of January 1377, accompanied by two thousand armed men, he perceived that there was much public agitation, that the Romans did not intend to fulfil their agreement, and that the government of the banaderesi went on as before. Accordingly, after naming Gomez Albornoz, a nephew of the deceased cardinal, to the office of senator, he retired to Anagni, and remained there until November 1377. The Romans presently waited on him with conciliating offers, and begged him to negotiate a peace for them with the prefect of Vico. In fact, the treaty was concluded at Anagni in October, and on the 10th of November confirmed in Rome by the general council. The meeting was held in the great hall of the Capitol, ubi consilia generalia urbis fieri solent, in the presence of all the members of the republican government. But the people was enraged by the survival of this government, and, being worn out by the persistent hostility of the Florentines, which reduced his power to a low ebb, had determined to make peace, when surprised by death on the 27th of March 1378.

The next pope, Urban VI. (1378-89), a Neapolitan, was the spirit of discord incarnate. His election was not altogether regular: the French party among the cardinals was against him; and the people were ripe for insurrection. But, regardless of all this, Urban threatened the cardinals in his first consistory, saying that church reform must begin with them; and he used the same tone with the people, reproving them for failing to suppress the banaderesi. In consequence of this the cardinals of the French party, assembling at Fendi, elected the antipope Clement VII. (1378-94) and started a long and peaceful schism in the church. Clement resided in Avignon, while Urban in Rome was engaged in opposing Queen Joanna I. of Naples and favouring Charles of Durazzo, who on conquering the Neapolitan kingdom, was made gonfalonier of the church and senator of Rome, where he left a vicar as his deputy. Shortly afterwards the pope went to Naples, and made fierce war on the king. Then, after many adventures, during which he tortured and put to death several cardinals whom he suspected of hostile intentions, he returned to Rome, where the utmost disorder prevailed. The conservators and the banaderesi were still at the head of the government, and, the pope speedily falling out with them, a riot ensued, after which he excommunicated the banaderesi. These at last made submission to him, and Urban VI. became master of Rome before his death in 1389. He was succeeded by Boniface IX. (1389-1404), another Neapolitan, but a man of greater shrewdness and capacity. His first act was to crown Ladislaus king of Naples, and secure the friendship and protection of this ambitious and powerful prince. In all the principal cities of the state he chose the reigning lords for his vicars. But he allowed Permo, Ascoli and Bologna the privilege of assuming their own vicariate for twenty-five years. And, as these different potentes and governments had only to pay him an annual tribute, all parties were satisfied, and the pope was able to bestow at least an appearance of order and unity on his state. But fresh tumults soon arose, partly because the conservators and banaderesi sought to govern on their own account, and especially because the pope seems for a time to have omitted naming the senator. Boniface was a prudent man; he saw that events were turning in his favour, now that throughout Italy liberty was tottering to its fall, and bided his time. He was satisfied for the moment by obtaining a recognition of the immunities of the clergy, rendering them solely amenable to ecclesiastical tribunals, and thus distinguishing the powers of the church from those of the state in Rome. The republic also pledged itself neither to molest the prelates nor to levy fresh contributions on them towards repairing the walls, to aid in recovering the estates of the church in Tuscia, and to try to conciliate the baronage. This concordat, concluded with the conservators and banaderesi on the 11th of September 1391, was also confirmed on the 5th of March 1392 by the bishops of the regions, together with a fresh treaty, by which both parties to further certain needs of the church, and, in particular, to furnish men to combat the prefect of Vico and the adherents of the antipope at Viterbo. With the exception of this city, Orchi and Civita Vecchia, all other conquered territory was to belong to the republic. But the Romans soon discovered that they were playing into the hands of the pope, who kept everything for himself, without even paying the troops. Upon this a riot broke out; Boniface fled to Perugia in October 1392, and resolved to exact better terms when next recalled to Rome. Meanwhile the Romans subdued the prefect, captured Viterbo, and, being already repentant, handed it over to the pope and implored his return. He then proposed his own terms, which were approved, not only by the conservators, banaderesi and four councillors, but also by the special council and by the unanimous vote of a general assembly, composed of the above-mentioned authorities, heads of regions, other officials and a hundred citizens (8th August 1393). These terms prescribed that the pope was to elect the senator, and that, on his failing so to do, the conservators would carry on the government after swearing fealty to him. The senatorial function was to be neither controlled nor hampered by the banaderesi. The immunities of the clergy were to be preserved, and all church property was to be respected by the magistrates. The expenses of the pope's journey were to be paid, and he was to be escorted to Rome in state. Boniface tried to complete his work by abolishing the banaderesi, the last bulwarks of freedom; but the people, although weakened and weary, made efforts to preserve them and, although their fall was inevitable, the struggle went on for some time.

During the spring of 1394 the banaderesi provoked an insurrection, in which the pope's life was endangered; it was only saved by the arrival of King Ladislaus, who came from Naples with a large force in the early autumn. But for the Neapolitan soldiery Boniface could not have withstood the long series of revolts that continually exposed him to fresh perils and the anxiety caused by the persistent schism of the church. The death of Clement VII. in 1394 was followed by the election of
another antipope, Benedict XIII. But a new jubilee was in prospect for the year 1400, and this was always an efficacious means of binding the will of the Romans. Depending upon this and the assistance of Ladislaus, Boniface not only demanded full powers to nominate senators (none having been recently elected), but insisted on the suppression of the banderesi. Both requests were granted; but, directly Angelo Alaleoni was made senator, a conspiracy was hatched for the re-establishment of the banderesi. However, the pope felt sure of his strength; the plot was discovered and the conspirators were beheaded on the stairs of the Capitol. This proved the end of the banderesi and of the liberties of Rome. The government was again directed by an alien senator together with three conservators; but the latter were gradually deprived of their political attributes, and became mere civil officers. The milizia, regions, guilds and other associations now rapidly lost all political importance, and before long were little more than empty names.

Thus in 1398 the Romans submitted to the complete sway of the pope, and in July of the same year the senator chosen by him was Malatesta dei Malatesti of Rimini, one of a line of tyrants, a valiant soldier, who was also temporal vicar and captain-general of the church. Boniface continued to appoint foreign senators during the rest of his life; he fortified the castle of St Angelo, the Vatican and the Capitol; he stationed galleys at the mouth of the Tiber, and proved himself in all things a thoroughly temporal prince. He aggrandized all his kindred, especially his brother, and, with the aid of his senator, his armed force and the protection of Ladislaus, succeeded in keeping down all the surviving nobles. In 1400, however, these made an attempt to upset the government. Niccolò Colonna forced his way into the city with cries of "Popolo, popolo! death to Boniface!" But the Romans had grown deaf to the voice of liberty, they refused to rise, and the senator, a Venetian named Zaccaria Trevisan, behaved with much energy. Colonna and his men had to beat a swift retreat to Palestrina. A charge of high treason was immediately instituted against him, and thirty-one rebels were beheaded.

The pope then proclaimed a crusade against all the Colonna, and sent a body of two thousand men and some of the Neapolitan soldiery to attack them. Several of their estates were seized and devastated, but Palestrina continued to hold out, and on the 7th of January 1401 the Colonna finally made submission to the pope. Nevertheless, they obtained advantageous terms, for Boniface left them their lands, appointed them vicars of other territories, and made similar agreements with the Gaetani and Orsini. In this way he became absolute master of Rome.

One chronicler remarks that "Romani tarnquam rigidi immutati in caliginem summatum," and the same tone is taken by others. But he did not succeed in putting an end to the schism of the church, which was still going on when he died in the Vatican on the 1st of October 1404.

Innocent VII. (1404-6) was the next pope. He too was a Neapolitan, and on his election the people again rose in revolt and refused to acknowledge him unless he consented to resign the temporal power. But Ladislaus of Naples hastened to his help, and an agreement was made which, under the cover of apparent concessions, really riveted the people's chains. Rome was recognized as the seat of the temporal and spiritual sovereignty of the pope, and the pope continued to appoint the senator. The people were to elect seven governors of the city, who were to swear fealty to the pope and carry on the government in conjunction with three other governors chosen by the pontiff or Ladislaus. The stipulations of Boniface IX. concerning ecclesiastical immunities were again confirmed. The banions were forbidden to place more than five lances each at the service of the people, and—which was the real gist of the covenant—the people were henceforth forbidden to make laws or statutes without the permission of the pope. The captain of the people, deprived of his political and judicial functions and reduced to a simple judge, was also to be chosen by the pope. But this treaty, drawn up on the 27th of October 1404, was not signed at the time, and many difficulties and disturbances arose when its terms were to be put into effect. The Romans nominated the seven governors, but, without waiting until the pope had chosen three more, placed the state in their hands, and styled them "governors of the liberty of the Roman Republic." They were, in fact, banderesi or reformatori under a new name. But the attempt proved inefficacious, for, at the pope's first threat of departure, the Romans made their submission, and the treaty of October was subscribed on the 15th of May 1405. Nevertheless, as it only bears the signatures of the "seven governors of the liberty of the Roman Republic," the pope would seem to have made some concessions. His position was by no means assured. Ladislaus was known to aspire to absolute dominion in Italy, and, although willing to aid in suppressing the republic, tried to prepare the way for his own designs, and frequently held out a helping hand to the vanquished. On the 6th of August fourteen influential citizens of Rome boldly presented themselves at the Vatican, and in a threatening manner led the pope to account for giving his whole attention to worldly things, instead of endeavouring to put a stop to the schisms of the church. But, on leaving his presence, they were attacked by Luigi Migliorati, the pope's nephew, and notorious for his violence, who killed eleven of their number, including several heads of the regions and two of the governors. An insurrection ensued, and the pope and his nephew fled to Viterbo. The Colonna tried to profit by these events, and applied to Ladislaus, who, hoping that the moment had come to make himself master of Rome, sent the count of Troia thither with a troop of three thousand horse. But the people, enraged by this treachery, and determined not to fall under the yoke of Naples, awoke for an instant to the memory of their past glories, and bravely repulsed the Colonna and the Neapolitans. And, on the speedy arrival of the Orsini with some of the papal troops, the people voluntarily restored the papal government, and, assembling the parliament, besought the pope to return on his own terms. Accordingly, after naming Francesco Panciatichi of Pistoia to the seneship, the pope came back on the 13th of March 1406, bringing his whole curia with him, and also the murderer Migliorati, who, triumphing in impunity, became more arrogant than before. Here indeed was a proof that the Romans were no longer worthy of liberty! And now, by means of the Orsini, Innocent had only to reduce the Colonna and other nobles raised to power by Ladislaus; nor was this very difficult, seeing that the king, in his usual fashion, abandoned them to their fate, and, making terms with the pope, was named gonfalonier of the church and again protected her cause.

Innocent, dying in 1406, was succeeded by Gregory XIII., a Venetian, who, as we shall presently see, resigned the chair in 1415. On his accession, finding his state firmly established, he seemed to be seriously bent on putting an end to the Great Schism, and for that purpose arranged a meeting with the antipope Benedict XIII. at the congress of Savona in 1408. But Gregory and Benedict only used the congress as a pretext for making war upon each other, and were urged on by Ladislaus, who hoped by weakening both to gain possession of Rome, where, although opposed by the Orsini, he had the support of the Colonna. Gregory, who had then fled from Rome, made a momentary attempt to win the popular favour by restoring the government of the banderesi; but Ladislaus marched into Rome in June 1408 and established a senator of his own. Meanwhile the two popes were continuing their shameful struggle, and the council of Pisa (March 1409), in attempting to check it, only succeeded in raising up a third pontiff, first in the person of Alexander V. (1409-10), and then in the turbulent Baldassare Cossa, who assumed the name of John XXIII. The latter began by sending a large contingent to assist Louis of Anjou against Ladislaus. But the enterprise failed, and, seeing himself deserted by all, Pope John next embraced the cause of his foe by naming him gonfalonier of the church. Thereupon Ladislaus concluded a sham peace, and then, seizing Rome, put it to the sack and established his own government there. Thus John, like the other two popes,
became a wanderer in Italy. In August 1414 Ladislaus died, and was succeeded by the scandalous Queen Joanna II. The Roman people promptly expelled the Neapolitans, and Cardinal Isolani, John's legate, succeeding in rousing a reaction in favour of the church, constituted a government of thirteen "conservators" on the 19th of October.

In November 1414 the council of Constance assembled, and at last ended the schism by deposing all the popes and incarcerating John XXIII., the most turbulent of the three. On the 11th of November 1417 Odo Colonna was unanimously elected to the papal chair; he was consecrated in the cathedral on the 27th as Pope Martin V., and, being acknowledged by all, hastened without delay to take possession of his see. Meanwhile disorder was at its height in Rome. The cardinal legate Isolani governed as he best could, while the castle of St Angelo remained in the hands of the Neapolitans, who still had a party in the city. In this divided state of affairs, Braccio, a daring captain of adventurers, nicknamed Fortebraccio, was inspired with the idea of making himself master of Rome. Overcoming the feeble resistance opposed to him, he succeeded in this on the 16th of June 1416, and assumed the title of "Defensor Urbis." But Joanna of Naples despatched Sforza, an equally valiant captain, against him, and, without offering battle, Fortebraccio withdrew on the 26th of August, after having been absolute master of the Eternal City for seventy days. Sforza marched in on the 27th and took possession of the city in the name of Joanna. Martin V. instantly proved himself a good statesman. He confirmed the legate Isolani as his vicar and Giovanni Savelii as senator. Leaving Constance on the 16th of May 1418, he reached Milan on the 10th of October, and slowly proceeded on his journey. While in Florence he despatched his brother and nephew to Naples to make alliance with Joanna, and caused them to be crowned on the 8th of October 1419 by his legate Morosini. Upon this she promised to give up Rome to the pope. Her general, Sforza, then entered the service of Martin V., and compelled Fortebraccio, who was lingering in a threatening attitude at Perugia, to make peace with the pope. The latter entrusted Fortebraccio with the conduct of the campaign against Bologna, and that city was reduced to submission on the 15th of July 1420. The Romans had already yielded to Martin's brother the legate, and now earnestly besought the arrival of their pope. Accordingly, he left Florence on the 15th of September 1420, and entered the Vatican on the 28th. Rome was in ruins; nobility and burghers were equally disorganized, the people unable to bear arms and careless of their rights, while the battered walls of the Capitol recorded the fall of two republics.

Martin V. had now to fulfil a far more difficult task than that of taking possession of Rome. Throughout Italy municipal freedom was overthrown, and the Roman Republic had ceased to exist. The Middle Ages were ended; the Renaissance was beginning. The universal unity both of church and of empire was dissolved; the empire was now Germanic, and derived its principal strength from direct dominion over a few provinces. Independent and national states were already formed or forming on all sides. The papacy itself had ceased to claim universal supremacy over the world's governments, and the possession of a temporal state had become essential to its existence. In fact, Martin V. was the first of the series of popes who were real sovereigns, and more occupied with politics than religion. Involved in all the foreign intrigues, falsehoods and treacheries of Italian diplomacy in the 15th century, their internal policy was imbued with all the arts practised by the tyrants of the Renaissance, and nepotism became necessarily the basis of their strength. It was natural that men suddenly elected sovereigns of a new country where they had no ties, and of which they had often no knowledge, should seek to strengthen their position by aggrandizing so-called nephews who were not unfrequently their sons.

Martin V. reduced the remains of the free Roman government to a mere civil municipality. Following the method of the other despots of Italy, the old republican institutions were allowed to retain their names and forms, their administrative and some of their judicial attributes, while all their political functions were transferred to the new government. Order was re-established, and justice rigidly observed. Many rebellious places were subdued by the sword, and many leaders of armed bands were hanged. The pope, however, was forced to lean on his kinmen the Colonna and again raise them to power by grants of vast fiefs both in his own state and the Neapolitan territory. And, after first supporting Joanna II., who had assisted his entry into Rome, he next sided with her adversary, Louis of Anjou, and then with Alphonso of Aragon, the conqueror of both and the constant friend of the pope, who at last felt safe in his own Rome and enjoyed peace and security, but had lost all hope of liberty. And when Martin died (20th February 1443) these words were inscribed on his tomb, "Temporum suorum felicitas."

Eugenius IV. (1431-47) leant on the Orsini, and was fiercely opposed by the Colonna, who excited the people against him. Accordingly on the 29th of May 1434 the Romans rose in revolt to the old cry of "Papol e popolo," and again constituted the rule of the seven governors of liberty. The pope fled by boat down the Tiber, and, being pursued with stones and shots, narrowly escaped with his life. On reaching Florence, he turned his energies to the recovery of the state. It was necessary to quell the people; but, first of all, the Colonna and the clan of the prefects of Vico, with their renewed princely power, had to be overthrown. The Orsini were still his friends. Eugenius took especial care that the forces of Patriarch (afterwards Cardinal) Vitelleschi, a worthy successor of Albornoz, and of greater ferocity if less talent. This leader marched his army towards Rome, and, instantly attacking Giovanni, prefect of Vico, captured and beheaded him. The family was now extirpated; and its possessions reverting to the church, the greater part of the Roman town was sold or given to Count Everso d'Anguillara, of the house of Orsini. The prefecture, now little more than an honorary title, was bestowed at will by the popes. Eugenius gave it to Francesco, founder of the powerfulline of the Gravina-Orsini. Thus one noble family was raised to greatness while another perished by the sword. Vitelleschi had already begun to persecute the Colonna and the Savelli, and committed terrible slaughter among them. Many castles were demolished, many towns destroyed; and their inhabitants, driven to wander famine-stricken over the Campagna, had to sell themselves as slaves for the sake of bread. Finally the arrogant patriarch marched into Rome, as into a conquered city, at the head of his men, and the Romans crouched at his feet. The pope now began to distrust him, and sent Scaramp, another prelate of the same stamp, to take his place. This new commander soon arrived, and, perceiving that Vitelleschi proposed to resist, had him surrounded by his soldiers, who were obliged to use force to compel his surrender. Vitelleschi was carried bleeding to the castle of St Angelo, where he soon afterwards died. The pope at last returned to Rome in 1443, and remained there quietly till his death in 1447.

His successor Nicholas V. (1447-55) was a scholar solely devoted to the patronage of literati and artists. During his reign there was a fresh attempt to restore the republic, but it was rather prompted by literary and classical enthusiasm than by any genuine patriotic ardour. Political passions and interests had passed to Paris. The conspiracy was headed by Stefano Porcari, a man of the people, who claimed to be descended from Cato. He had once been captain of the people in Florence, and was made podestà of Bologna by Eugenius IV. He was a caricature of Cola di Rienzi, and extravagantly proud of his
Latin speeches in honour of ancient republican liberty. The admiration of antiquity was then at its height, and Porcari found many enthusiastic hearers. Directly after the death of Eugenius IV. he made a first and unsuccessful attempt to proclaim the republic. Nevertheless Nicholas V., with the same indulgence for scholars that had prompted him to pardon Valla for denying the temporal power of the papacy and laughing to scorn the pretended donation of Constantine, freely pardoned Porcari and named him podestà of Anagni. He filled this office with credit, but on his return to Rome again began to play the agitator, and was banished to Bologna with a pension from the pope. Nicholas V. had conferred all the state offices upon priests and abbots, and had erected numerous fortresses. Hence there were many malcontents in Rome, in communication with Porcari at Bologna, and ready to join in his plot. Arms were collected, and on the day fixed he presented himself to his fellow-conspirators adorned with rich robes and a gold chain, and harangued them in Latin on the duty of freeing their country from the yoke of the priests. His design was to set fire to the Vatican on the 6th of January 1453, the feast of Epiphany; he and his followers were to seize the pope, the cardinals and the castle of St. Angelo. But Nicholas received timely warning; the conspirators’ house was surrounded; and Porcari himself was seized while trying to escape, confined in the castle of St. Angelo, and put to death with nine of his companions on the 9th of January. Others shortly suffered the same fate.

Under Calixtus III. and Pius II. affairs went on quietly enough, but Paul II. (1464–71) had a somewhat troubled reign. Yet he was a skilled politician. He re-ordered the finances and the courts of justice, punished crime with severity, was an energetic foe to the Malatesta of Rimini, put an end to the oppression exercised in Rome by the wealthy and arrogant house of Anguillara, and kept the people in good humour with continual festivities. But—and this was a grave defect at that period—he extended no favour to learning, and, by driving many scholars from the curia to make room for his own kinsmen, brought a storm about his ears. At that time the house of Borgia was on the decline. Leto was the rendezvous of learned men and the seat of the Roman Academy. Leto was an enthusiast of antiquity; and, as the members of the Academy all assumed old Latin names, they were suspected of a design to re-establish paganism and the republican government. It is certain that they all inveighed against the pope; and, as the latter was no man of half measures, during the carnival of 1468 he suddenly imprisoned twenty Academicians, and even subjected a few of them to torture. Pomponio Leto, although absent in Venice, was also arrested and tried; but he exculpated himself, craved forgiveness, and was set at liberty. His friends were also released, for the charge of conspiracy proved to be unfounded. Certain members of the Academy, and notably Platina in his Lives of the Popes, afterwards revenged themselves by stigmatizing Paul II. as the persecutor of philosophy and letters. But he was no more a persecutor than a patron of learning; he was a politician, the author of some useful reforms, and solely intent on the consolidation of his absolute power. Among his reforms may be classed the revision of the Roman statutes in 1469, for the purpose of destroying the substance while preserving the form of the old Roman legislation, and entirely stripping it of all political significance. In fact the pope’s will was now absolute, and even in criminal cases he could trample unhindered on the common law.

There was still a senator of Rome, whose nomination was entirely in the hands of the pope, still three conservators, the heads of the rioni, and an elected council of twenty-six citizens. Now and then a shadowy semblance of a popular assembly was held to cast dust in the eyes of the public, but even this was not for long. All these officials, together with the judges of the Capitol, retained various attributes of different kinds. They administered justice and gave sentence. There were numerous tribunals all with undefined modes of procedure, so that it was very difficult for the citizens to ascertain in which court justice should be sought. But in last resort there was always the supreme decision of the pope. Thus matters remained to the time of the French Revolution.

For the completion of this system a final blow had to be dealt to the aristocracy, whose power had been increased by nepotism; and it was dealt by bloodshed under the three following popes—Sixtus IV. (1471–84), Innocent VIII. (1484–92) and Alexander VI. (1492–1503)—each of whom was worse than his predecessor. The first, by means of his nephews, continued the slaughter of the Colonna, sending an army against them, devastating their estates at Marino, and beheading the protonotary Lorenzo Colonna. Innocent VIII. was confronted by the power of the Orsini, who so greatly endangered his life by their disturbances in the city that he was only saved by an alliance with Naples. Neither peace nor order could be lastingly established until these arrogant barons were overthrown. This task was accomplished by the worst of the three pontiffs, Alexander VI. All know how the massacre of the Orsini was compassed, almost simultaneously, by the popes Borgia and his equally iniquitous son, Caesar Borgia, at Sinigaglia (1502). This pair dealt the last blow to the Roman aristocracy and the tyrants of Romagna, and thus the temporal dominion of the papacy was finally assured. The republic was now at an end; it had shrivelled to a civil municipality. Its institutions, deprived of all practical value, lingered on like ghosts of the past, subject from century to century to unimportant changes. The history of Rome is henceforth absorbed in that of the papacy.

Nevertheless the republic twice attempted to rise from its grave, and on the second occasion gave proofs of heroism worthy of its most glorious past. It was first resuscitated in February 1798, by the influence of the French Revolution, and the French constitution of the year III. was rapidly imitated. Rome had again two councils—the tribunate and the senate, with five consuls constituting the executive power. But in the following year, owing to the military reverses of the French, the government fell. The last papal court was restored until 1809, when Napoleon I. occupied the city of Rome, and proclaimed to his empire the States of the Church. Rome was then governed by a consule streeordinaria—a special commission—with the municipal and provincial institutions of France. In 1814 the papal government was again reinstated, and the old institutions, somewhat modified on the French system, were recalled to life. Pius IX. (1848–77) tried to introduce political reforms, and to improve and simplify the old machinery of state; but the advancing tide of the Italian revolution of 1848 drove him from Rome; the republic was once more proclaimed, and had a brief but glorious existence. Its programme was dictated by Giuseppe Mazzini, who with Saffi and Armellini formed the triumvirates at the head of the government. United Italy was to be a republic with Rome for her capital. The rhetorical idea of Cola di Rienzi became heroic in 1849. The constituent assembly (4th February 1849) proclaimed the fall of the temporal power of the popes, and the establishment of a republic which was to be not only of Rome but of all Italy. Although then herself a republic, assumed the unenviable task of re-establishing the temporal power by force of arms. But the gallant defence of Rome by Garibaldi covered the republic with glory. The enemy was repulsed, and the army of the Neapolitan king, sent to restore the pope, was also driven off. Then, however, France despatched a fresh and more powerful force; Rome was vigorously besieged, and at last compelled to surrender. On the 2nd of July 1849 the heroic general departed from the city with some thousands of his followers. Almost at the same time the constituent assembly proclaimed in the Capitol the constitution of the Roman Republic. Immediately afterwards the French restored the government of Pius IX., whose reign down to 1870 was that of an absolute sovereign. Then the Italian government entered Rome (20th September 1870), proclaimed the national constitution (9th October 1870), and the Eternal City became the capital of Italy. Thus the
scheme of national unity, the natural outcome of the history of Rome and of Italy, impossible of accomplishment under the rule of the papacy, was finally achieved by the monarchy of Savoy, which, as the representative and personification of Italian interests, abolished the temporal power of the papacy and made Rome the seat of government of the united country (see ITALY).

AUTHORITIES.—The history of the commune of Rome in the middle ages has to be collected from the scattered materials in special treatises, or from the general histories of the papacy. The greater part of this work has been found in the Annales Pontificales, edited by the Abbé Duchesne (2 vols., Paris, 1866-92), and in the collected histories of Rome by Felix Papencordt and Gregorovius (see below). Vitali, Storia diplomatica de Senatori di Roma (2 vols., Rome, 1791); Galletti, Del primissimo della Saria Seda Apostolica e di altri ufficii, detti del Pitture (Rome, 1770); Vendettini, Del Senato Romano (Rome, 1782); Baronius, Annales Ecclesiastici, continued by Raynaldus (2 vols. fol., 1738-56), and the recent continuations of Thier relating to the years 1757-92; J. Ficker, Forschungen zur Reichs- und Reichsgeschichte Italiens (4 vols., Innsbruck, 1868-74); Savigny, Geschichte des römischen Rechts im Mittelalter (frequently reprinted and translated into all the principal languages); Leo, Entwicklung der Verfassung der lombardischen Städte (Hamburg, 1842); M. A. von Bethmann-Hollweg, Ursprung der lombardischen Städtefreiheit (Anhang: Schicksale der römischen Städteverfassung im Exarchat und in Rom) (Bonn, 1846); Heged, Geschichte der Städteverfassung von Italien (Leipzig, 1847); Gieseler, Geschicht der römischen Stadt (Leipzig, 1869-73); Dieu-Peyron, Antiq. Rome (3 vols., Paris, 1875-81); A. von Reumont, Geschichte der Stadt Rom (3 vols., Berlin, 1867-68).

Among more recent works see especially M. Creighton, History of the Papacy (London, 1897); L. Pastor, Geschichte des Papiest seit dem Ausgang des Mittelalters (3 vols., Leipzig, 1897-1902). The works of this kind, but written in an extremely clerical spirit: more impartial, although written by a Jesuit, is P. H. Grisar's Storia di Roma e dei Papi nel Medio Evo (Italian edition, Rome, 1899, &c., not yet completed).

For the history of the republic in the 18th and 19th centuries will be found useful the histories of the Italian Risorgimento (see under ITALY). A very important and complete work on the events of Rome in 1848-49 is G. Trevelyan's Garibaldi's Defence of the Roman Republic (London, 1867), which contains a full bibliography.

(Proc. V. F.)

ROME, a province of modern Italy, co-extensive with the compartimento of Lazio, but really covering a considerably larger region, is the ancient Italy, even including Latium adjectum. On the S.E. and E., along the coast lies the Adriatic, far, the boundary being that between the former papal states and the kingdom of Naples, running from a point S.E. of Terracina along the eastern edge of the Volscian mountains to Cepano, and thence along the Liris river. It then runs N.E. through the mountains to Carsoli, being conterminous with the Abruzzi; it then includes part of the ancient Sabine country, reaching the Tiber near the railway station of Fara Sabina, 25 m. N. of Rome. It follows the river for some distance, where it is conterminous with Umbria, and then runs S.W. to the coast, where it is conterminous with the province of Grosseto (Tuscany), thus including a considerable portion of the ancient Etruria. The resident population in 1907 was estimated at 1,196,000 (including Rome itself, 520,196), and the floating population, Italian and foreign, 54,383. In 1907 the total number was calculated at 1,278,000. In 1871 the aggregate population was only 836,704. Emigration rose from 2222 in 1866 to 18,507 in 1906, there being a great rise in 1905, as over all Italy. The economic crisis in the United States in 1907, however, led to a set-back, many emigrants being obliged to return to Italy. A great deal of this work is abstracted from the mines principally near Tola. At Filletta a deposit of limestone, 175 ft. above sea-level, asphatic rock is obtained, and salt from a rock-salt mine near Corneto Tarquinius. Chemical fertilizers are manufactured by several firms. The main industries of the district are, however, agricultural (see LATIUM).

ROME, a city and the county-seat of Floyd county, in the N.W. part of Georgia, U.S.A., at the junction of the Etowah and Oostanaula rivers, which here form the Coosa. Pop. (1900) 7290, of whom 2830 were negroes; (1910) 12,099. It is served by the Central of Georgia, the Western & Atlantic (leased by the Nashville, Chattanooga & St. Louis), the Southern and the Rome & Northern railways, and the Coosa river is navigable from this point to the falls of the river in Alabama. The city is the seat of Shorter College (for women), which was established in 1873 as the Cherokee Female College, and received its present name in 1877, when it was rebuilt and endowed by Colonel Alfred Shorter; and of the Berry Industrial School (1902), for mountain boys.

Rome is situated in a rich agricultural region producing cotton, cereals, vegetables and fruits, for which it is a trading centre, and cement, brick, fire-brick clay, coal, slate and marble. Rome's principal manufactures are cotton, cotton-seed oil, lumber, foundry and machine-shop products, bricks and agricultural implements. Its site was originally within the territory of the Cherokee, and on the other side of the Oostanaula river there is said to have been at one time an Indian village, which, like several other Creek villages, was called Chiaha (or Chehaw).

Here, in October 1793, in his Etowah campaign, John Sevier, with militia from Tennessee, crushed a party of marauding Indians. The present battlefield is commemorated by a monument in Myrtle Hill cemetery. The county was erected in 1833. The first settlement of Rome was made in 1834, and immediately afterwards it became the county-seat. Rome was first chartered as a city in 1847. In 1863 there were brilliant cavalry manoeuvres in its vicinity, which resulted in the capture (May 3) of Colonel Abel D. Streight (Federal) with 1800 men by General Nathan B. Forrest (Confederate), with a force one-third the size of that of his opponent. On the 10th of May 1864 the city was captured by a detachment of the Federal Army of General William T. Sherman, then conducting his Atlanta campaign. In 1848-75 Rome was the home of Charles Henry Smith (1826-1903), a popular humorist, who wrote under the name "Bill Arp." In 1866 East Rome (pop. 671 in 1900) and North Rome (pop. 966 in 1900), which was formerly called Forestville, were annexed to the city.

ROME, a city of Oneida county, New York, U.S.A., on the Mohawk river and Wood Creek, and the Erie and the Black river canals, 14 m. W.N.W. of Utica. Pop. (1890) 14,991; (1900) 15,343, of whom 2577 were foreign-born; (1910) census, 20,497. Rome is served by the New York Central & Hudson River, the Oneida, Watertown & Ogdensburg (controlled by the New York Central), the New York, Ontario & Western, and the Utica & Mohawk Valley (electric) railways. It is about 30 ft. above sea-level. The city is the seat of the Academy of the Holy Names (opened in 1865 as St Peter's Academy), of the State Custodial Asylum for unteachable idiots, of the Central New York Institution for Deaf Mutes (1875), and of the Oneida County Home. The Jervis Public Library (1895), founded by John Bloomfield Jervis (1795-1885), a famous railway engineer, had in 1909 about 15,000 volumes. The surrounding country is devoted largely to farming, especially vegetable gardening, and to dairying. Among the manufactures are brass and copper work, wire for electrical uses, foundry and machine-shop products, locomotives, knit goods, tin cans and canned goods (especially vegetables). In 1905 the value of the factory products was $8,631,427 (55-6% more than in 1900).

The portage at this place between the Mohawk river and Wood Creek, which are about 1 m. apart, gave the site its Indian name, De-o-wain-ata, "place where canoes are carried from one stream to another," and its earliest English name, The Great (or Oneida) Carrying-Place, and gave it strategic value as a key between the Mohawk Valley and the St. Lawrence river. There were built, to protect the carrying-place here, Fort Bull, on Wood Creek, which was surprised and taken by French and Indians in March 1756, and Fort Williams, on the Mohawk, which, for Fort Craven, also on the Mohawk, was destroyed by Colonel Daniel Webb after the reduction of Oswego by the French
in August 1736. General John Stanwix built Fort Stanwix here at an expense of £56,000, and the first permanent settlement dates from about this time. In October—November 1768, Sir William Johnson and representatives of Virginia and Pennsylvania met 3200 Indians of the Six Nations to make a treaty with them, under which, for £12,466 in money and provisions, they surrendered to the crown their claims to what is now Kentucky and West Virginia and the western part of Pennsylvania. Of this cession the part which lay in Pennsylvania was secured by purchase from the Indians for the proprietors Richard and Thomas Penn (see Pittsburg). The fort was dismantled immediately afterward. After 1776, when it was partly repaired by Colonel Elias Dayton, it was called by the continental forts Schuyler, in honour of General Philip Schuyler, and so is sometimes confused with (old) Fort Schuyler at Utica. The third regiment of the New York line under Colonel Peter Gansevoort occupied the fort in April 1777 and completed the repairs begun in 1776; on the 3rd of August in the same year (one month before the official announcement by Congress of the design of the flag) the first flag of the United States, made according to the enactment of the 14th of June and used in battle, was raised here: it was made from various pieces of cloth. On the 2nd of August an advance party of St Leger's forces, consisting of 750 men, arrived before the fort, and the next day a force of about 650 whites, including loyalists—the Royal Greens—under Sir John Johnson, and more than 800 Indians, some led by Joseph Brant—arrived soon afterwards. The fort then contained about 750 men under Colonel Gansevoort, with Lieut.-Colonel Marinus Willett as second in command. The danger to the fort roused General Nicholas Herkimer to gather a force of between 700 and 1000 men (including some Oneida Indians), who during their advance on the 6th of August were ambuscaded in a ravine near Oriskany (q.v.), about 8 m. E. of the fort; after heavy losses to both sides, about 250 men from the fort under Willett attacked the camp of the Indians who were supporting St Leger, thus relieved Herkimer through the falling back of the British and Indians to save their supplies, captured five ensigns of the Royal Greens, and seized large quantities of stores from the enemy's camp. The siege now lost force, and the Indians straggled away after the loss of their camp supplies, and on the 23rd of August, St Leger, hearing exag-gerated reports of the immense force of large reinforcements under General Benedict Arnold, withdrew abandoning his camp and stores. The successful resistance here to St Leger contributed greatly to the American success at Saratoga. Fort Stanwix was the headquarters of Colonel Gozen Van Schaick (1736-1789) in 1779 when he destroyed the Onondaga villages. At the fort, on the 22nd of October 1784, a treaty was made by Oliver Wolcott, Richard Butler and Arthur Lee, commissioners for the United States, with the chiefs of the Six Nations. In 1796 a canal was built across the old portage between Wood Creek and the Mohawk river. In 1796 the township of Rome was formed, receiving its name, says Schoolcraft, "from the heroic defence of the republic made here." The village of Rome, in the centre of the township, was incorporated in 1819; and Rome was chartered as a city in 1873.

See James Jones, Annals and Recollections of Oneida County (Rome, 1831); W. M. Willett, A Narrative of the Military Actions of Col. Marinus Willett (New York, 1831); and Orderly Book of Sir John Johnson during the Oriskany Campaign (Albany, 1882), with notes by W. L. Stone and J. W. de Peyster.

ROMÉ DE L’ISLE—JEAN BAPTISTE L’ISLE-ÉDOUARD (1736-1790) French mineralogist, was born on the 26th of August 1736 at Gray, in Haute-Saône. As secretary of a company of artillery he visited the East Indies, and was taken prisoner by the English in 1761 and held in captivity for three years. Subsequent ly he became distinguished for his researches on mineralogy and crystallography. He was the author of Essai de Cristallographie (1772), the second edition of which, regarded as his principal work, was published as Cristallographie (3 vols. and atlas, 1785). He died at Paris on the 7th of March 1790.

ROMESH CHANDRA MITRA, SIR (1840—1899), Indian judge, was born in 1840. When the East India Company's charter was renewed in 1853, the old supreme courts and sard courts in the presidency towns were changed into high courts, and Sir Hoarfield, a native of the northeast, Raja Mohan Roy, was the first Indian who was appointed a judge of the new high court of Calcutta. He did not live, however, to take his seat on the bench, and was succeeded by Sambhu Nath Pandit, and then by Dwaraka Nath Mitra, perhaps the most talented judge that India produced in the 19th century. Dwaraka Nath's great ability and thorough insight into cases were universally recognized in India; his decisions were valued and often quoted; and his name was often mentioned as an illustration of the judicial capacity of the natives of India. Anukul Chandra Mukerji also sat on the bench for a time; and on his death in 1871, Romesh Chandra Mitra was appointed judge in his place. He maintained the high reputation of his predecessors, and for a period of nearly twenty years, down to 1890, he performed his judicial duties with credit and distinction. When the post of chief justice was temporarily vacant in 1882, the marquis of Ripon, then viceroy of India, appointed Romesh Chandra to officiate in that post—the highest judicial position in the Indian empire. Lord Dufferin, who succeeded Lord Ripon, also appointed Dr. Mitra. Sir Romesh Chandra a member of the Public Service Commission, and in the capacity in which he did valuable work. Failing health compelled him to retire from the high court in 1890, and he was then knighted and appointed a member of the viceroy's legislative council. Till he died in 1890, he continued to take interest in all social, educational and political reforms in India.

ROMFORD, a market town in the Romford parliamentary division of Essex, England; on the small river Rom, which flows into the Thames; 124 m. E.N.E. from London by the Great Eastern railway. Pop. of urban district (1901) 13,656. The ancient church of St Edward the Confessor was replaced in 1850 by a structure in Decorated style. There is a large brewery in the town, and extensive market gardens in the neighbourhood. A grant of a market was obtained in 1247, and this is still of importance as regards both cattle and corn. Romford was included in the liberty of Havering-atte-Bower, which until 1892 had a jurisdiction of its own distinct from that of the county, with a high steward, magistrates, clerk of the peace, assize, quarter sessions. The name of Bower was derived from the name of the place attached to the ancient royal hunting-lodge in the vicinity.

The fact that Romford (Rumford, Rumsford) lies on the high road between Colchester and London has determined its history. Bronze implements have been found here, but no notice of Romford occurs till the 12th century. It was included in the liberty of Havering, and the chief business of the liberty was conducted there. But the corporation which is mentioned in medieval records is not that of the town of Romford, but of the liberty of Havering. Romford has only had a separate constitution since a local board of health was formed in 1894, under the act of 1875, after the abolition of the liberty in 1892. In the middle ages Romford was rather a meeting-place for merchants than an industrial centre. Brewing, however, is mentioned in 1331, and one tanner at least carried on business in Hare Street in 1467.

ROMILLY, JOHN ROMILLY, 1ST BARON (1802—1874), English judge, was the second son of Sir Samuel Romilly, and was born on the 20th of January 1802. He was educated at Trinity College, Cambridge, and called to the bar at Gray's Inn in 1827. He first entered parliament in 1832 as member for Bridport, and in 1843 he became a queen's counsel. He was elected M.P. for Devonport in 1847, and was appointed solicitor-general in 1848 in Lord John Russell's administration and attorney-general in 1850. In 1851 he was appointed master of the rolls, and continued to sit for Devonport till the general election in 1852, when he was defeated. He was the last master of the rolls to sit in parliament. Romilly was raised to the peerage as Baron Romilly of Barry in 1866, and
ROMILLY, SIR S.—ROMNEY, G.

retired from the mastership of the rolls in 1873. He did much to remove the restrictions which had long hampered research among the public records and state papers. Lord Romilly died in London on the 23rd of December 1874.

ROMILLY, SIR SAMUEL (1757-1818), English legal reformer, was the second son of Peter Romilly, a watchmaker and jeweller in London, whose father had emigrated from Montpellier after the revocation of the edict of Nantes, and who had married Margaret Garnault, a Huguenot refugee like himself, but of a far wealthier family. Samuel Romilly was born in Frith Street, Soho, on the 1st of March 1757. He served for a time in his father's shop; but his education was not neglected, and he became a good classical scholar and particularly conversant with French literature. A legacy of £1000 from one of his mother's relations led to his being articled to a solicitor and clerk in chancery with the idea of qualifying himself to purchase the office of one of the six clerks in chancery. In 1778, however, he determined to go to the bar, and entered himself as Gray's Inn. He went to Geneva in 1781, where he made the acquaintance of the chief democratic leaders, including Étienne Dumont. Called to the bar in 1783, he went to the midlands where he was already familiarized with the French practice. On the publication of Madan's *Thoughts on Executive Justice*, advocating the increasing of capital punishments, he at once wrote and published in 1786 *Observations* on Madan's book. Of more general interest is his intimacy with the great Mirabeau, to whom he was introduced in 1784. Mirabeau saw him daily for a long time and introduced him to Lord Lansdowne, who highly appreciated him, and, when Mirabeau became a political leader, it was to Romilly that he applied for an account of the procedure used in the English House of Commons. He visited Paris in 1789, and studied the course of the Revolution there; and in 1790 he published his *Thoughts on the Probable Influence of the Late Revolution in France upon Great Britain*, a work of great power. His practice at the chancery bar continued largely to increase, and in 1800 he was made a K.C. In 1798 he married Anne, daughter of Francis Garbett of Knill Court, Herefordshire; and in 1805 he was appointed chancellor of the county palatine of Durham. His great abilities were thoroughly recognized by the Whig party, to which he attached himself; and when, in 1802, he was appointed one of the Baronetage, with the title of Baronet of Massingham, he became a K.C.B. In 1807 he published the essays 'The Talents of the First Men of the Age' and 'The Talents of the Country Gentlemen'; and in 1808 he published the last volume of the great *Franklin's Works*. In the same year, he was appointed one of the judges of the new Supreme Court, and he became a K.C.G.B. He was, however, raised to a peerage in the same year, and in the following year three bills repealing equally salutary statutes were thrown out by the House of Lords under the influence of Lord Ellenborough. Year after year the same influence prevailed, and Romilly saw his bills rejected; but his patient efforts and his eloquence ensured victory eventually for his cause by opening the eyes of Englishmen to the barbarity of their criminal law. The only success he had was in securing the repeal, in 1812, of a statute of Elizabeth making it a capital offence for a soldier or a mariner to beg without a pass from a magistrate or his commanding officer. Sir Samuel Romilly's efforts made his name famous not only in England but all over Europe, and in 1818 he had the honour of being returned at the head of the poll for the city of Westminster. He did not long survive his triumph. On the 29th of October 1818 Lady Romilly died in the Isle of Wight. Her husband's grief was intense, and he committed suicide in a fit of temporary insanity on the 2nd of November. No man of his time was more loved than Sir Samuel Romilly; his singularly sweet nature, his upright manliness, his eloquence and his great efforts on behalf of humanity secured him permanent fame.

See the Memoirs of the Life of Sir Samuel Romilly written by himself, with a selection from his Correspondence, edited by his Sons (3 vols., 1840); *The Speeches of Sir Samuel Romilly in the House of Commons* (2 vols., 1820); "Life and Work of Sir Samuel Romilly," by Sir W. J. Collins, in Trans. of the Huguenot Society (1908).

ROMILLY-SUR-SEINE, a town of north-central France, in the department of Aube, a mile from the left bank of the Seine and 24 m. N.W. of Troyes, on the Paris-Belfort line. Pop. (1906) 9777.

Romilly is an important industrial town, with extensive manufactories of cotton and woolen hosiery, and of the special machinery and appliances required for the industry. The Eastern Railway Company has large workshops here.

ROMINTEH, a village of Germany, in the province of East Prussia, 12 m. N.E. from Goldap, situated in the Rominde Heide, a fine tract of heath and forest country, 90 sq. m. in extent, well stocked with game and affording excellent sport. Here is a famous hunting-box of the German emperor, with a church adjacent, both in the Norwegian style. Pop. 1200.

See K. E. Schmidt, *Die Rominter Heide* (Danzig, 1898).

ROMNEY, GEORGE (1734-1802), English historical and portrait painter, was born at Dalton-in-Furness, Lancashire, on the 26th of December 1734. His father was a builder and cabinet-maker of the place, and the son, having manifested a turn for mechanics, was instructed in the latter craft, showing considerable dexterity with his fingers, executing carvings of figures in wood, and constructing a violin, which he spent much time in playing. He was also busy with his pencil; and some of his sketches of the neighbouring royalties having attracted attention, his father was at length induced to apprentice the boy, at the age of nineteen, to an itinerant painter of portraits and domestic subjects named Steele, an artist who had studied in Paris under Vanloo; but the erratic habits of his instructor prevented Romney from making great progress in his art. In 1756 he impulsively married a young woman who had nursed him through a fever, and started as a portrait painter on his own account, travelling through the northern counties, executing likenesses at a couple of guineas, and producing a series of some twenty figure compositions, which were exhibited in Kendal, and afterwards disposed of by means of a lottery.

Having, at the age of twenty-seven, saved about £100, he left a portion of the sum with his wife and family, and started to seek his fortune in London, never returning, except for brief visits, till he came, a broken-down and aged man, to die. Credit must, however, be given him for recognizing to some extent his family responsibilities. He did not allow his wife and children to fall into poverty, and he gave help to his brothers, who seem to have resembled him in a kind of shiftlessness of temperament. In London he rapidly rose into popular favour. His portrait of Captain Grinnell was included in the *Second Prize of the Society of Arts*, and a word from Reynolds in praise of Mortimer's "Edward the Confessor" led to the premium being awarded to that painter, while Romney had to content himself with a donation of £50, an incident which led to the subsequent coldness between himself and the president which prevented him from exhibiting at the Academy or presenting himself for its honours.

In 1754 he paid a brief visit to Paris, where he was befriended by Joseph Vernet; and his portrait of Sir Joseph Yates, painted on his return, bears distinct traces of his study of the works of Rubens then in the Luxembourg Gallery. In 1766 he became a member of the Incorporated Society of Artists, and three years later he seems to have studied in their schools.
Soon he was in the full tide of prosperity. He removed to Great Newport Street, near the residence of Sir Joshua, whose fame in portraiture he began to rival in such works as “Sir George and Lady Warren” and “Mrs Yates as the Tragic Muse”; and his professional income rose to £1200 a year. But this marked increase in his popularity had the effect of enlarging his ambitions, and he became anxious to attempt subjects which required more experience than he possessed. Realizing as he did the need for more thorough knowledge, he was seized with a longing to study in Italy; and in the beginning of 1773 he started for Rome in company with Oziás Humphrey, the miniature painter. On his arrival he separated himself from his fellow-traveller and his countrymen, and devoted himself to solitary study, raising a scaffold to examine the paintings in the Vatican, and giving much time to work from the undraped model, of which his painting of a “Wood Nymph” was a fine and graceful result. At Parma he concentrated himself upon the productions of Correggio, which fascinated him and greatly influenced his practice.

In 1775 Romney returned to London, establishing himself in Cavendish Square, and resuming his extensive and lucrative employment as a portrait painter, which in 1785, according to the estimate of his pupil Robinson, yielded him an income of over £3600. The admiration of the town was divided between him and Reynolds. “There are two factions in art,” said Lord Thurlow, “and I am of the Romney faction”—and the remark, and the rivalry which it implied, caused much annoyance to Sir Joshua, who was accustomed to refer contemptuously to the younger painter as “the man in Cavendish Square.” After his return from Italy Romney formed two friendships which powerfully influenced his life. He became acquainted with Hayley, his future biographer, then in the zenith of his little-merited popularity as a poet. His influence on the painter seems to have been far from salutary. Weak himself, he flattered the weaknesses of Romney, encouraged his excessive and morbid sensibility, disturbed him with amateurish fancies and suggestions, and tempted him to expend on slight rapid sketches, and ill-considered, seldom-completed paintings of ideal and poetical subjects, talents which would have found fitter exercise in the steady pursuit of portraiture. About 1783 Romney was introduced to Emma Hart, afterwards celebrated as Lady Hamilton, and she became the model from whom he worked incessantly. Her bewitching face smiles from numerous canvases; he painted her as a Magdalen and as a Joan of Arc, as a Circe, a Bacchante, a Cassandra; and he has himself confessed that she was the inspirer of what was most beautiful in his art. But her fascinations seem to have been too much for the more than middle-aged painter, and they had their own share in aggravating that nervous restlessness and instability, inherent in his nature, which finally ruined both health and mind.

In 1786 Alderman Boydell started his great scheme of the Shakespeare Gallery, apparently at the suggestion of Romney. The painter at least entered heartily into the plan, and contributed a scene from the Tempest, and his “Hamlet Shakespeare attended by the Passions,” the latter characterized by the Redgraves as one of the best of his subject pictures. Gradually he began to withdraw from portrait painting, to limit the hours devoted to sitters, and to turn his thoughts to mighty schemes of the ideal subjects which he would execute. Already, in 1792, he had painted “Milton and his Daughters,” which was followed by “Newton making Experiments with the Prism.” He was to paint the Seven Ages, Visions of Adam with the Angel, “six other subjects from Milton—three where Satan is the hero, and three from Adam and Eve,—perhaps six of each.” Having planned and erected a large studio in Hampstead, he removed thither in 1797, with the fine collection of casts from the antique which his friend Flaxman had gathered for him in Italy. But his health was now irretrievably shattered, and the man was near his end. In the summer of 1799, suffering from great weakness of body and the profound depression of mind, he returned to the north, to Kendal, where his deserted but faithful and long-suffering wife received and tended him. He died on the 15th of November 1802.

The art of Romney, especially his figure subjects, suffered greatly from the waywardness and instability of the painter’s disposition, from his want of fixed purpose and sustained energy. He lacked the steadfast perseverance needful to the accomplishment of a great picture. Afflicted as he was throughout his life by an unreasonable timidity and by a self-consciousness which led him at one moment into assertive affectations and at another into exaggerated humility, he avoided the society of his brother artists and lost many opportunities of receiving that frank professional criticism which might have stimulated him to more serious effort. In unwholesome surroundings he steadily deteriorated. His imagination flashed and flickered fitfully upon him, like April sunshine. His fancy would be captivated by a subject, which was presently embodied in a sketch, but the toil of elaborating it into the finished completeness of a painting too frequently outtaxed his powers; he became embarrassed by technical difficulties which, through defective early training, he was unable to surmount, and the half-covered canvas would be turned to the wall. Even in the pictures he finished he was unable to keep to any consistent level of achievement. He produced some fine things, very personal in style and very skilful in handling; but much that he did seems too tentative and too plainly deficient in shrewdness of insight to deserve serious consideration. His colour, too, was often unpleasant, hot and monotonous, and his composition was apt to be stilted and artificial. It is in the best of his portraits that we feel the painter’s real ability. These, especially his female portraits, are full of grace, charm, distinction, and sweetness. When we examine his heads of Cowper and Wilkes, his delicate and dignified full-length of William Beckford, his “Parson’s Daughter” in the National Gallery, and his group of the Duchess of Gordon and her Son, we cannot deny his claim to rank as one of the notable portrait painters of 18th-century England.

See the Memoirs by William Hayley (1806) and by the artist’s son, the Rev. John Romney (1830); Cunningham’s Lives of the Painters; George Romney and his Art, by Hilda Gamlin (1894). In the fully illustrated George Romney, by Lord Ronald Sutherland Gower (1904), pictures, mainly studies, are reproduced not to be found in any other work. The art of Romney, by Humphry Ward and W. Roberts (1904), is a monograph of real importance, containing 70 illustrations, a biographical and critical essay, and a catalogue raisonné of the painter’s works. Arthur B. Chamberlain’s Romney (1910) has 73 plates.

ROMNEY, HENRY SIDNEY, EARL OF (1641-1704), fourth son of Robert, 2nd earl of Leicester, was born in Paris in 1641. He and his nephew, Robert Spencer, afterwards 2nd earl of Sunderland, his senior by a few months, were sent to travel on the continent of Europe in charge of a Calvinist divine, Dr Thomas Pierce. Sidney’s handsome face helped his advancement at court, but the favour in which he was held by the duchess of York, to whom he was master of the robes, led to his dismissal in 1666. His disgrace, however, was short-lived. He was promoted captain in 1667, and colonel in 1678. In 1672 he was sent on a mission of congratulation to Louis XIV., and in 1677 became master of the robes to Charles II. He entered parliament as member for Bramber in 1679, and became a close political ally of his nephew Sunderland, with whose wife he carried on an intrigue which caused considerable scandal. Sunderland made this intimacy a means to further his political ends, while Sidney’s social reputation and his apparent frivolity partly concealed his real capacity for intrigue. Sidney was sent by Sunderland and others in 1679 on a special mission to urge William of Orange to visit England, a task that he was able to discharge while acting as the official envoy of Charles II. at the Hague. He was recalled in 1682, but was again sent on a special mission to Holland in the year of the accession of James II. He returned to England in the spring of 1688, and set to work, at William’s desire, to obtain promises of support for the Prince of Orange in the event of his landing. He was presently allowed to leave England on giving his word not to visit the
Hague, but he broke his promise on getting clear of England, and conveyed to William a duplicate of the invitation addressed to him by the English nobility, together with intelligence of affairs of state obtained through the countess of Sunderland. He landed with William at Torbay, and received substantial rewards with the grant of a pension. Sworn to the crown in 1689, Sidney was made gentleman of the bedchamber and colonel of the king’s regiment of footguards, and received the titles of Baron Milton and Viscount Sidney of Shепpey. In 1690 he received considerable grants of land from the confiscated estates of the Irish supporters of James II., much of which he lost, however, on the parliamentary investigation in 1699 into the distribution of the Irish lands. William made him secretary of state in 1690, pending the discovery of a better person. He was soon asked to resign, but was compensated by his appointment, in 1692, as lord-lieutenant of Ireland. His inability to cope with the difficulties of this position led to his recall in the next year, when he became master-general of the ordnance. He was created earl of Romney in May 1694, and he retired William’s confidence to the last, but on Anne’s accession he was dismissed from his various offices. He never married, and his titles became extinct on his death on the 8th of April 1704.

In 1801 the title of earl of Romney was revived in the family of Marsham. Sir Robert Marsham, Bart. (1685–1724), of Cuxton in Kent, was a member of parliament from 1708 to 1716, when he was created viscount of Romney. His grandson Charles, the 3rd Baron (1774–1811), was created earl of Romney in 1801, and from him the present earl is descended.

**ROMNEY (NEW ROMNEY),** a municipal borough and one of the Cinque Ports in the Ashford parliamentary division of Kent, England, 75 m. S.E. by E. of London by the South-Eastern & Chatham railway. Pop. (1901) 13,288. It lies in the open, flat and low tract of Romney Marsh, part of a level extending from Winchelsea in the south-west to Hythe in the north-east, which was within historic times in great part covered by an estuarine inlet of the sea. The river Rother, which now has its mouth at Rye Harbour, formerly entered the sea here, but had its course wholly changed during a great storm in 1287, and the gradual accretion of land led to the decay, not only of Romney, but of Winchelsea and Rye as seaports. Romney Marsh itself, which extends north of New Romney, is protected by a seawall of great thickness, and its guardianship and drainage is in the hands of a special ancient corporation. The level affords pasture for vast flocks of sheep. New Romney, which is now over a mile from the sea, has large sheep fairs, but little other trade. Of the five churches mentioned here in the Domesday Survey only one remains, but this, dedicated to St Nicholas, is a rich Norman building with later additions. Its Norman west tower is among the finest in England, and it has a beautiful Decorated east window with reticulated tracery. New Romney, the name of which distinguishes it from the decayed village of Old Romney, 2 m. W., is governed by a mayor, 4 aldermen, and twelve councillors. Area, 1,351 acres. LITTLESTONE-ON-SEA, on the coast E. of New Romney, is in some favour as a seaside resort and has excellent golf-links.

Its fine harbour was the cause of the early importance of Romney (Romenal, Romenhall). The annual assembly of the Cinque Ports, called the Brodhull, was held here owing to its central position. At the time of Domesday the archbishop of Canterbury and the bishop of Bayeux were joint lords. Romney also owed maritime service to the king, which consisted of supplying five ships to serve for fifteen days in the year. A confirmation of liberties was granted by John in 1205. The town, which was a borough by prescription, was governed “from immemorial” by twelve jurats; a bailiff was appointed by the archbishop, but the rights of the overlords seem to have been small, and in 1521 the inhabitants denied the bailiff the right of presiding with the jurats over their court. Elizabeth changed the style of incorporation to the mayor, jurats and commonalty, and another charter was granted by James II. in 1686, which remained the governing charter until 1835. The Cinque Ports were first summoned to parliament in 1265; the first returns for Romney are for 1266; it returned two members until it was disfranchised in 1832.

**ROMORANTIN,** a town of central France, capital of an arrondissement in the department of Loir-et-Cher, 31 m. S.E. of Blois by rail. Pop. (1906) town, 6,836; commune, 8,374. The town is situated on the Sauldre at its confluence with the Morantin, whence its name (Rivus Morantinus). A church dating mainly from the 12th century, a gateway of the 16th century and some old houses are the chief objects of interest. The remains of a château rebuilt by Francis I. in the Renaissance style are used as the sub-prefecture. Tribunals of first instance and of commerce, and a communal college are among the public institutions. The manufacture of flannel and cloth especially for army clothing is carried on, together with trade in wine, live stock, agricultural produce and the asparagus of the vicinity.

In 1560 Romorantin gave its name to an edict which prevented the introduction of the Inquisition into France. The industrial importance of the town dates from the later middle ages.

**ROMSDAL,** the valley of the river Rauma, in Norway. The Rauma is a torrent descending from Lake Lesjekogen to the Romsdal Fjord on the west coast (62° 30' N.). The nearest port is Molde, from which steamers run to Veblingsnesa (30 m.) at the foot of the valley. A good road traverses the valley, which is one of the finest in southern Norway, flanked by steep mountains terminating in abrupt peaks—Vengeinder (5960 ft.), Romsdalshorn (5105), Trolfjinder (“witch-peaks”), 6800 ft. and others. Several waterfalls are seen, such as the Mongofes, the Vaermofos, falling nearly 1000 ft., and the Slettafoss. Lake Lesjekogen also drains from the opposite end by the Laagen or Lougen river to the Glommen, and so to the Skagerrack, and the road follows its valley, the Gudbrandsdal. The Romsdal gives its name to an amt (county) extending from the promontory of Stadt in the south to Ram Fjord in the north, including the Stor, Molde, Halsi and Halse fjords, the ports of Aale- sund, Molde and Christiansund, and reaching inland to the Dovrefjeld.

**ROMSEY,** a market town and municipal borough in the New Forest parliamentary division of Hampshire, England, 7 m. N.W. of Southampton by the London & South-Western railway. Pop. (1901) 4365. It is pleasantly situated in the rich valley of the Test. The abbey church of SS. Mary and Eleda is one of the finest examples in England of a great Norman church little altered by later builders. Its history is not clear, but a house was founded here by Edward the elder (c. 1010), and became a Benedictine nunnery. The church, which is the only important relic of the foundation, is cruciform, with a low central tower. Building evidently began in the first half of the 12th century, and continued through it, as the western part of the nave shows the transition to the Early English style, which appears very finely in the west front. Decorated windows occur in the east end, beyond which a chapel in this style formerly extended. Perpendicular insertions are insignificant. The nave and choir have aisles, triforium and clerestory. The transepts have eastern apsidal chapels, as have the choir aisles, though the walls of these last are square without. Foundations of the apse of a large pre-Norman church have been discovered below the present building. In Romsey there are tanyards, ironworks and works of the Berthon Boat Company. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 533 acres.

Romsey (Romseyg, Romesie) probably owed its origin, as it did its early importance, to the abbey. At the time of the Domesday Survey it was owned by the abbey, which continued to be the overlord until the dissolution. There is no evidence to show that Romsey was a borough before the charter of incorporation granted by James I. in 1608. This was confirmed by William III. in 1692, and the corporation was reformed in 1835. Romsey has never been represented in parliament. The right to hold a fair was granted to the abbey by Henry III.
in 1271, and fairs were held on Easter Monday, on August 26 and November 8. The market now held on Thursday, formerly Saturday, dates from 1273. Every alternate Thursday is a great market. In medieval times Romsey had a considerable share of the woollen trade of Hampshire, but by the end of the 17th century this manufacture began to decline, and the introduction of machinery and the adoption of steam led to its subsequent transference to the northern coal centres. The clothing trade was replaced by the manufacture of paper, an industry which still exists.

ROMULUS, the legendary eponymous founder and first king (753–716?) of Rome, represented as the son of Mars by the Vestal Rhea Silvia or Iliæ, daughter of Numitor, who had been dispossessed of the throne of Alba by his younger brother Amulius. Romulus and Remus, the twin sons of Silvia, were placed in a trough and cast into the Tiber by their granduncle. The trough grounded in the marshes where Rome afterwards stood, under the wild fig tree (ficus ruminalis), which was still holy in later days. The babes were suckled by a she-wolf and fed by a woodpecker, and then fostered by Acca Larentia, wife of the shepherd Faustulus. They became leaders of a warlike band of shepherds on the Palatine, and in course of time were recognized by their grandfather, whom they restored to his throne, slaying the usurper Amulius. They now proposed to found a city on the site where they had been nurtured; but a quarrel for precedence broke out and Remus was slain. Romulus strengthened his band by offering an “asylum” to outcasts and fugitives, found wives for them by capture and waged war with their kinsmen. His most formidable foe was Titus Tatius (q.v.), king of the Sabines, but after an obstinate struggle he and Romulus united their forces and reigned side by side till Tatius was slain at Lavinium in the course of a blood-feud with Laurentum. Romulus then reigned alone till he suddenly disappeared in a storm. He was thereafter worshipped as a god under the name of Quirinus, which, however, is really a Sabine form of Mars. The story of Romulus, best preserved in the first book of Livy (see also Dion. Halic. i. 75–ii. 56; Plutarch, Romulus; Cicero, de Republica, ii. 2–10), belongs throughout to legend. This was felt in later times by the Romans themselves, who gave a rationalistic explanation of the miraculous incidents. Thus, Mars was converted into a stranger disguised as the god of war, and the she-wolf into a woman of ill-fame (lupa); Romulus was not taken up into heaven, but put to death and carried away piecemeal by the patricians under their cloaks.

The whole story, probably first given by the annalists Fabius Pictor and Cincius Alimentus, contains religious and aetiological elements. The foundation of the city by twins may be explained by the worship of the Lares, who are generally represented as a pair of brothers, especially as the mother of Romulus and Remus was connected with the worship of the heath of the state. The introduction of the wolf may be of Greek or eastern origin; it may have a totemistic significance; or may be due to the fics ruminalis, the fig tree near the Lupercal on the Palatine, where the twins were first exposed. This tree was sacred to the goddess Rumina of the shepherds (the suckling incident), and the resemblance between Romulus and ruminalis led to the fig tree and the founder of the city being subsequently connected by the Roman antiquarians. The wolf would then be suggested by the proximity of the Lupercal, the grotto of Faunus Lupercus, with whom the shepherd Faustulus is identical. According to Professor Ducati of Bologna, in a paper on an old Etruscan stele, on which a she-wolf is represented suckling a child, the wolf legend is an importation from Etruria, the original home of which was Crete. Miletus, son of Apollo and a daughter of Minos, having been exposed by his mother, was suckled by she-wolves, being afterwards found and brought up by shepherds. To escape the designs of Minos, Miletus fled to Asia Minor, and founded the city called after him, where the Etruscans first became acquainted with the legend. The opening of the “asylum” is a Greek addition (as the name itself suggests). Down to imperial times, the Romans seem to have been ignorant of the Greek custom of taking sanctuary; further, the idea was entirely opposed to the exclusive spirit of the ancient Italians. The story was probably invented to give an explanation of the sacred spot named “Inter duos lucos” between the ax and the Capitol. Another Greek touch is the deification of an eponymous hero. The rape of the Sabine women is clearly aetiological, invented to account for the custom of marriage by capture. Consus, at whose festival the rape took place, was a god of the earth and crops, the giver of fruitfulness in plants and animals. It is generally agreed that the capture of the Capitol by Titus Tatius may contain an historical element, pointing to an early conquest of Rome by the Sabines, of which there are some indications. Subsequently, to efface the recollection of an event so distasteful to Roman vanity and national pride, Sabine names and customs were accounted for by a supposed union of Romans and Sabines during the regal period, the result of a friendly league concluded between Romulus and Tatius. According to E. Pais, Romulus is merely the eponym of Roma; his life is nothing but the course of the sun, and the institutions ascribed to him are the result of long historical development.

Romulus, like his double Tullus Hostilius, is regarded as the founder of the military and political (see Rome), as Numa and his counterpart Ancus Marcus of the religious institutions of Rome.

For a critical examination of the story, see Schwegger, Römische Geschichte, bks. viii.–x; Sir George Cornelius Lewis, Credibility of early Roman History, chap. 11. W. Hue, History of Rome, i. Sir J. Seeley, Introduction to his ed. of Livy, bk. 3; E. Pais, Storia di Roma (1898), i. pt. 1, and Ancient Legends of Roman History (Eng. trans., 1906); also O. Gilbert, Geschichte und Topographie der Stadt Rom im Altertum (1883–1885).

RONCESVALLES (Fr. Roncenaux), a village of northern Spain, in the province of Navarre; situated on the small river Urrobi, at an altitude of 3200 ft. among the Pyrenees, and within 5 m. from the French frontier. Pop. (1900) 152. Roncesvalles is famous in history and legend for the defeat of Charlemagne and the death of Roland (q.v.) in 778. The small collegiate church contains several curious relics associated with Roland, and is a favourite place of pilgrimage. The battle is said to have been fought in the picturesque valley known as Val Carlos, which is now occupied by a hamlet bearing the same name, and in the adjoining defile of Ibarreta. Both of these are traversed by the main road leading north from Roncesvalles to St Jean Pied de Port, in France.

RONCONI, GIORGIO (1810–1890), Italian baritone vocalist, was born in 1810. He learnt singing from his father Domenico, who had been a celebrated tenor in his time, and made his début in 1831 at Pavia. After singing in Italy for some years with ever-growing success, he appeared for the first time in England, in 1842, as Henry Ashton in Lucia di Lammermoor. His success was immediate, and he continued to be one of the most popular artists on the lyric stage until his retirement in 1866. His voice was neither extensive in compass nor fine in quality, but the genius of his acting and the strength of his personality fully atoned for his vocal limitations. He was a great favourite of Victoria and the two parts he is best remembered, Rigoletto and Figaro, show conclusively the range of his talent. In his later years Ronconi founded a school of singing at Granada, and he also accepted the post of professor of singing at the Madrid Conservatorio. He died in 1890.

RONDA, a town of southern Spain, in the province of Malaga; on the river Guadaira and on the Algeciras-Bobadilla railway. Pop. (1900) 20,095. Ronda is built on a high rock nearly surrounded by the Guadaira, which flows through an abrupt chasm 530 ft. deep and 300 ft. wide, by which the old town is separated from the new. Of the three bridges, one is said to have been built by the Romans, another by the Moors; the most modern (1761) spans the stream in a single arch at a height of about 255 ft. On the edge of the chasm is the alameda or public promenade, commanding a wide and beautiful prospect of the fertile valley or vega and the sierras beyond. The old
RONDEAU—RONDO

part of the town has a Moorish aspect, with narrow, steep and crooked lanes, and still retains some Moorish towers and other medieval buildings. The Ronda bull-ring is one of the finest in Spain, and can accommodate 10,000 spectators. Ronda has a considerable trade in leather, saddlery, horses, soap, flour, chocolate, wine and hats.

Some remains of an aqueduct and theatre, about 7 m. N. of Ronda, are supposed to represent the Acinipo or Arunda of ancient geographers. Ronda was taken from the Moors in 1485. It gives its name to the Sierra or Serranía de Ronda, one of the main sections of the coast mountains which rise between the great plain of Andalusia and the Mediterranean.

RONDEAU (Ital. Rondo), a structural form in poetry and (in the form of "rondo") in music. In poetry the rondeau is a short metrical structure which in its perfect form consists of thirteen eight- or ten-syllabled verses divided into three strophes of unequal length, and knitted together by two rhymes and a refrain. In Clement Marot's time the laws of the rondeau were laid down, and, according to Voiture, in the 17th century, the following was the type of the approved form of the rondeau:

"Ma foy, c'est fait de moy, car Isabbeu
M'a conjuré de luy faire un Rondou:
Cela me met en une peine extrême.

Pourquoi donc, si vous aviez aimé
Votre vers, huitz cinq en ëme.
Je luy ferais aussi tôt un bateau!

En voilà cinq pourtant en un monceau:
Faisons en huitz, en invoquant Brodeau,
En puis mettons, par quelque stratagême,
Ma foy, c'est fait !"

All forms of the rondeau, however, are alike in this, that the distinguishing metrical emphasis is achieved by a peculiar use of the refrain. Though we have a set of rondeaux in the Rolliad (written by Dr. Lawrence the friend of Burroughs, according to Edmund Gosse, who has given us an admirable essay upon exotic forms of verse), it was not till recent years that the form had any real vogue in England. Considerable attention, however, has lately been given in England to the form. Some English rondeaux are as bright and graceful as Voiture's own. Swinburne, who in his Century of Roundels was perhaps the first to make the refrain rhyme with the second verse of the first strophe, has brought the form into high poetry. In German, rondels have been composed with perfect correctness by Weckherlin, and with certain divergences from the French type by Götze and Fischart; the German name for the form is rundum or ringel-gedicht.

Although the origin of the refrain in all poetry was no doubt the improvisatore's need of a rest, a time in which to focus his forces and recover breath for future flights, the refrain has a distinct metrical value of its own; it knits the structure together, and so intensifies the emotional energy, as we see in the Border ballads, in the Oríens of Lord Tennyson, and in the Sister Helen of Rossetti. The suggestion of extreme artificiality—of "difficulty overcome"—which is one great fault of the rondeau as a vehicle for deep emotion, does not therefore spring from the use of the refrain, but from the too frequent recurrence of the rhymes in the strophes—for which there is no metrical necessity as in the case of the Petrarchan sonnet. The rondeau is, however, an inimitable instrument of gaiety and grace in the hands of a skillful poet.

RONDEL, a form of verse closely allied to the rondeau (q.v.) but distinguished from it by containing fourteen instead of thirteen lines, and by demanding a slightly different arrangement of rhymes. Moreover, the initial couplet is repeated in the middle and again at the close. The arrangement of rhymes is as follows: a, b, b, a; a, b, a; b, a, b, a, b. This form, which was invented in the 14th century, was largely used in

later medieval French poetry, but particularly by Charles d'Orléans (1391-1465), the very best of whose graceful creations are all rondels. One of the most famous of this prince's rondels may be given here as a type of their correct construction:—

"Le temps a laissé son manteau
De vent, de froidure et de pluye,
Et s'est vestu de broue;
De souilh luisant, cler et beau.
Il n'y a beste ne oyseau
Qu'en son jargnon ne chante ou crie:
Le temps a laissé son manteau
De vent, de froidure et de pluye.

Riviére, fontaine et ruisseau
Portent, en livrée jolie.
Gouttes d'argent d'or d'acier;
Chacun s'abille de nouveau;
Le temps a laissé son manteau
De vent, de froidure et de pluye."

The rondel, in French, may begin with either a masculine or a feminine rhyme, but its solitary other rhyme must be of the opposite kind. The rondel was introduced into English in the 15th century, but the early specimens of it are very clumsy. It was revised in the 19th century, but it appears to suit the French better than any other language. Correct examples are found in the poems of Robert Bridges, Dobson, Gosse and Henley. The following, by Austin Dobson, gives an exact impression of what an English rondeau should be in all technical respects:—

"Love comes back to his vacant dwelling—
The old, old Love that we knew of yore!
We see him stand by the open door,
With his great eyes sad, and his bosom swelling.

He makes as though in our arms repelling
He fain would lie as he lay before:

Love comes back to his vacant dwelling—
The old, old Love that we knew of yore!
Ah! who shall help us from over-spelling
That sweet, forgotten, forbidden lore?

E'en as we doubt, in our hearts once more,
With a rush of tears to our eyelids welling,
Love comes back to his vacant dwelling,
The old, old Love that we knew of yore!"

Théodore de Banville remarks that the art of the rondel consists in the gay and natural reintroduction of the refrain, which should always seem inevitable, while slightly changing the point of view of the reader. If this is not successfully achieved, "on ne fera que de la marquerette et du placage, c'est-à-dire, en fait de poésie,—rien!" In Germany, the rondel was introduced, in the 18th century, under the name of ringel-gedicht, by Johann Nikolaus Götz (1713-1781), and was occasionally used, in the course of the 19th century, by German poets.

RONDO, a musical form originally derived from the rondeau in verse; as may be seen, long before the development of instrumental forms, in some of the chansons of Orlando di Lasso. The rondeau en couples of Couperin and his contemporaries shows both in name and form the same connexion with verse. It consists of the alternation between a single neatly rounded phrase and several slightly contrasted episodes (the couples) without any important change of key. Bach enriched it with his wealth of invention, but did not expand its range.

The later sense of the term covers an important series of the sonata forms (q.v.), chiefly found in finales; but rondo-form sometimes occurs in slow movements (e.g., Mozart, Haydn Serenade, String Quintet in E flat; Beethoven, Fourth Symphony; Quartet, Op. 74, &c.). The single-phrase ritornello and short couples of the old form are in the sonata style replaced by a broadly designed melody and well-contrasted episodes in different keys.

If the form of a Bach or Couperin rondo may be represented by A B A C D A D A, &c., the various forms of the later rondo may be represented somewhat as follows: placing on a horizontal line those parts that are in the main key, and representing other keys by differences of level:—

(i) Sectional rondu; i.e. with little or no development or
transition between episode and main theme; very characteristic of Haydn, who, however, often gives it more organization than appears on the surface—A A A A coda—very rarely with no change of key except between tonic major and minor, as in Haydn's famous Gypsy Rondo. Frequently the episodes are increased in number or made to recur. Beethoven most clearly shows the influence of Haydn in his frequent use of modifications of this type of rondo in his earlier works, e.g., finales of Sonatas, Op. 10, No. 3, Op. 14, Nos. 1 and 2. He also applied it very successfully to his early slow movements, as in the Sonatas, Op. 2, Nos. 1 and 4 ("Pathétique"). The sectional rondo was modernized on a gigantic scale by Brahms in the finales of his G Minor Piano Quartet, Op. 25; and Schumann's favourite art-forms are various compounds between it and the cognate idea of the dance-tune with one or more "trios," as in the Novellettes, the Arabeske, and the Romance in B major.

(ii) Rondos influenced by the form of a first movement (for which see SONATA FORMS). The normal scheme for this, which is Mozart's favourite rondo-form, is

A A A A A A coda C

and it is easy to see how it may be applied to sectional rondsos, as in the finale of Beethoven's Sonata, Op. 13. But it normally implies longer and weightier themes and a higher degree of organization. If the second episode (C) is transformed into an elaborate development of previous material in various keys, the resemblance to first-movement form is increased; the only external difference being the recurrence of A in full after the first episode B (which is treated exactly like the "second subject" of a first movement). As, however, many first movements that do not repeat their exposition (corresponding to A+B in the above rondo-scheme) make a feint of so doing before beginning the development, it is obvious that the blending of rondo and first-movement form may become very complete. In fact, the true criterion of a rondo is, as with all real art-forms, a matter of style rather than of external shape. The well rounded-off, self-repeating, tune-like character of the main theme, and a sense of pleasure and importance in the mere fact of its return (without absolute necessity for dramatic effect) are the distinctive evidences of rondo form and style. This rule is well proved by the case most frequently cited as an exception, the rondo of Beethoven's Sonata in D, Op. 10, No. 3; for nothing can be more significant than the way in which its fragmentary opening figure is built up into a self-contained musical epigram and ended with a full close, as contrasted with the way in which the most tuneful of first-movement beginnings (e.g., Beethoven's Quartet in F major, Op. 59, No. 1, Trio in B flat, Op. 97; Brahms's String Quintet in F major, Op. 88) expand gradually into their further course.

The following are some of the more important of many modifications and applications of this form:

(a) Omission of return of main theme before recapitulation of episode—A A A A A A coda B C

(b) A A B (A) like a first movement without a development. Here A will be very large and the transition to B important, while B will consist of a considerable number of themes. See the finales of Mozart's E flat String Quartet and C major Quintet, most of his greater slow movements, and many of Beethoven's.

In concertos the only modifying influence is the balance between solo and orchestra. In rondo-form it is the tendency to give the orchestra a greater number of subsections at the outset, which perhaps do not reappear until the coda, where, with the aid of the solo, they can round off the design very effectively. Mozart's use of this device is not confined to concertos.

(D. F. T.)

RONSARD, PIERRE DE (1524-1585), French poet and "prince of poets" (as his own generation in France called him), was born at the Château de la Poissonnière, near the village of Couture in the province of Vendômois (department of Loir-et-Cher), on the 11th of September 1524. His family are said to have come from the Slav provinces to the south of the Danube (provinces with which the crusades had given France much intercourse) in the first half of the 14th century. Baudoin de Ronsard or Rossart was the founder of the French branch of the house, and made his mark in the early stages of the Hundred Years' War. The poet's father was named Loys, and his mother was Jeanne de Chaudrier, of a family not only noble in itself but well connected. Pierre was the youngest son. Loys de Ronsard was maître d'hôtel du roi to Francis I., whose captivity after Pavia had just been softened by treaty, and he had to quit his home shortly after Pierre's birth. The future Prince of Poets was educated at home for some years and sent to the Collège de Navarre at Paris when he was nine years old. It is said that the rough life of a medieval school did not suit him. He had, however, no long experience of it, being quickly appointed page, first to the king's eldest son François, and then to his brother the duke of Orleans. When Madeleine of France was married to James V. of Scotland, Ronsard was attached to the king's service, and he spent some years in Great Britain. The later part of this time seems to have been passed in England, though he had, strictly speaking, no business there. On returning to France in 1540 he was again taken into the service of the duke of Orleans. In this service he had other opportunities of travel, being sent to Flanders and again to Scotland. After a time a more important employment fell to his lot, and he was attached as secretary to the suite of Lazare de Baïf, the father of his future colleague in the Pléiade and his companion on this occasion, Antoine de Baïf, at the diet of Spires. Afterwards he was attached in the same way to the suite of the cardinal du Bellay-Langey, and his mythical quarrel with Rabelais dates mythically from this period. His apparently promising diplomatic career was, however, cut short by an attack of deafness which no physician could cure, and he determined to devote himself to study. The institution which he chose for the purpose among the numerous schools and colleges of Paris was the Collège Coqueret, the principal of which was Daurat—afterwards "dark star" (as he has been called from the silence in French) of the Pléiade, and already an acquaintance of Ronsard's from his having held the office of tutor in the Baïf household. Antoine de Baïf, Daurat's pupil, accompanied Ronsard; Belleau shortly followed; Joachim du Bellay, the second of the seven, joined not much later. Muretus (Jean Antoine de Muret), a great scholar and by means of his Latin plays a great influence in the creation of French tragedy, was also a student here.

Ronsard's period of study occupied seven years, and the first manifesto of the new literary movement, which was to apply to the vernacular the principles of criticism and scholarship learnt from the classics, came not from him but from Du Bellay. The Défense et illustration de la langue française of the latter appeared in 1549, and the Pléiade (or Brûgge, as it was first called) may be said to have been then launched. It consisted, as its name implies, of seven writers whose names are somehow differently enumerated, though the orthodoxy, or conformity, is beyond doubt composed of Ronsard, Du Bellay, Baïf, Belleau, Pontus de Tyard (a man of rank and position who had exemplified the principles of the friends earlier), Jodelle the dramatist, and Daurat. Ronsard's own work came a little later, and a rather idle story is told of a trick of Du Bellay's which at last determined him to publish. Some single and minor pieces, an epithalamium on Antoine de Bourbon and Jeanne de Navarre (1550), a "Hymne de la France" (1549), an "Ode à la Paix," preceded the publication in 1550 of the four first books ("first" is characteristic and noteworthy) of the Odes of Pierre de Ronsard. This was followed in 1552 by the publication of his Amours de Cassandre with the fifth book of Odes. These books excited a violent literary quarrel. Marot was dead, but he left a numerous school, some of whom saw in the stricter literary critique of the Pléiade, in its outspoken contempt of merely vernacular and medieval forms, its strenuous address...
to French poetry to “follow the ancients,” and so forth, an insult to the author of the *Adolescence Clémentine* and his followers. The French court, and indeed all French society, was just then much interested in literary questions, and a curious story is told of the rivalry that ensued. Mellin de Saint-Gelais, it is said, the chief of the *École Marotique* and a poet of no small merit, took up Ronsard’s book and read part of it in a more or less designedly burlesque fashion before the king. It may be observed that if he did so it was a distinctly rash and uncourtlier-like act, inasmuch as, from Ronsard’s father’s position in the royal household, the poet was personally known and liked both by Henry and by his family. At any rate, Marguerite de Valois, the king’s sister, afterwards duchess of Savoy, is said to have snatched the book from Saint-Gelais and insisted on reading it herself, with the result of general applause. Henceforward, if not before, his acceptance as a poet was not doubtful, and indeed the tradition of his having to fight his way against cabals is almost entirely unsupported. His popularity in his own time was overwhelming and immediate, and his prosperity was unbroken. He published his *Hymns*, dedicated to Marguerite de Savoie, in 1555; the *Lamentations of the Amours*, addressed to another heroine, in 1558; and then a collection of *Œuvres complètes*, said to be due to the invitation of Mary Stuart, queen of Francis II., in 1560; with *Elégies, masques et bergeries* in 1565. To this same year belongs his most important and interesting *Abrigré de l’art poétique français*.

The rapid change of sovereigns did Ronsard no harm. Charles IX., who succeeded his brother after a very short time, was even better inclined to him than Henry and Francis. He gave him rooms in the palace; he bestowed upon him divers abacacies and priories; and he called him and regarded him constantly as his master in poetry. Neither was Charles IX. a bad poet. This royal patronage, however, had its disagreeable side. It excited violent dislike to Ronsard on the part of the Huguenots, who wrote constant pasquinades against him, stove (by a ridiculous exaggeration of the Dionysiac festival at Arueil, in which the friends had indulged to celebrate the success of the first French tragedy, Jodelle’s *Cléopâtre*) to represent him as a libertine and an atheist, and (which seems to have annoyed him more than anything else) set up his follower Du Bartas as his rival. According to some words of his own, which are quite credible considering the ways of the time, they were not contented with this variety of argument, but attempted to have him assassinated. During this period Ronsard’s work was considerable but mostly occasional, and the one work of magnitude upon which Charles put him, the *Franciaise* (1572), has never been ranked, even by his most devoted admirers, as a chief title to fame. The metre (the decasyllable) which the king chose could not but contrast unfavourably with the magnificent alexandrines which Du Bartas and Agrippa d’Aubigné were shortly to produce; the general plan is feebly classical, and the very language has little or nothing of that racy mixture of scholarship and love of natural beauty which distinguishes the best work of the Pléiade. The poem could never have had an abiding success, but at its appearance it had the singular bad luck almost to coincide with the massacre of St. Bartholomew, which had occurred about a fortnight before its publication. One party in the state were certain to coldly on the work of a minion of the court at such a juncture, the other had something else to think of. The death of Charles made, indeed, little difference in the court favour which Ronsard enjoyed, but, combined with his increasing infirmities, it seems to have determined him to quit court life. During his last days he lived chiefly at a house which he possessed in Vendôme, the capital of his native province, at his abbey at Croix-Val in the same neighbourhood, or else at Paris, where he was usually the guest of Jean Galland, well known as a scholar, at the Collège de Boncourt. It seems also that he had a town house of his own in the Faubourg Saint-Marc. At any rate his preferments made him in perfectly easy circumstances, and he seems neither to have derived nor wished for any profit from his books. A half-jocular suggestion that his publisher should give him money to buy “du bois pour se chauffer” in return for his last revision of his *Œuvres complètes* is the only trace of any desire of the kind. On the other hand, he received not merely gifts and endowments from his own sovereign but presents from many others, including Elizabeth of England. Mary, queen of Scots, who had known him earlier, addressed him from her prison; and Tasso consulted him on the *Gerusalemme*. His last years were, however, saddened not merely by the death of many of his most intimate friends, but by constant and increasing ill-health. This did not interfere with his literary work in point of quality, for he was rarely idle, and some of his latest work is among his best. But he indulged (what few poets have wisely indulged) the temptation of constantly altering his work, and many of his later alterations are by no means for the better. Towards the end of 1585 his condition of health grew worse and worse, and he seems to have moved restlessly from one of his houses to another for some months. When the end came, which, though in great pain, he met in a resolute and religious manner, he was at his priory of Saint-Germain at Versailles. He was, it seems, buried as was the first, in the church of that name on Friday, December 27.

The character and fortunes of Ronsard’s works are among the most remarkable in literary history, and supply in themselves a kind of illustration of the progress of French literature during the last three centuries. It was long his fortune to be almost always extended and admired; at times violently attacked. As has been said, the enmity, not altogether unprovoked, of the friends and followers of Marot fell to his lot, then the still fiercer antagonism of the Huguenot faction, who, having to possess a poet of great importance, took Barthelemy Jodelle at almost any point. But fate had by no means done its worst with him in his lifetime. After his death the classical reaction set in under the auspices of Malherbe, who seems to have been animated with a sort of personal hatred towards Ronsard, thought it need not trouble them ever more. After Malherbe, the glance of Corneille and his contemporaries obscured the tentative and unequal work of the Pléiade, which was, moreover, directly attacked by Boileau himself, the dictator of French criticism in the last half of the 17th century. The few sonnets which were excepted by them from their censure, find now, French of mind, and Fénélon, forgotten when he was not sneered at. In this condition he remained throughout the whole 18th century and the first quarter of the 19th. The Romantic revival, seeing in him a victim of its special bible noir, Boileau, and attracted by his splendid diction, rich mental faculty, and combination of classical and medieval peculiarities, adopted his name as a kind of battle-cry, and for the moment exaggerated his merits somewhat. The critical work of Sénèque, first, of Sainte-Beuve, and of the *précieuse* française au 16ème siècle, and since of others, has established Ronsard pretty securely in his right place, a place which may be defined in a few sentences. For a general survey of the Pléiade, see FRENCH LITERATURE. Ronsard, its acknowledged chief and its most voluminous poet, was probably also its best, though a few isolated pieces of Boileau excelled him in airy lightness of touch. Several sonnets of Du Bellay are also admirable, and one of the sonnets of the time is the *Petit chant de Louise de Bréza* (1549); and in his *Historien du pays de France* (1550) is a famous *Mignon telle est* la rose, the “Fontaine Bellerive,” the *Forêt de Gastine,* and so forth), which have an extraordinary grace and freshness. No one used with more art than he the graceful diminutives which
RONSARD—RÖNTGEN, D. 693

his school set in fashion. He knew well how to manage the government of his "spice-box" (as M. V. Hugo jokingly likens it) which were another fancy of the Pitié, and in his hands they rarely become still or cumbersome. In short, Ronsard shows eminently the two great attractions of French 16th-century poetry as compared with that of the two following centuries—magnificence of language and imagery and graceful variety of metre.

BIBLIOGRAPHY.—The chief separately published works of Ronsard are noted above. He produced, however, during his life a vast number of separate publications, either made up of mere pamphlets or broadsheets, of which, in course of time he collected a small number of others at the same time, in the successive editions of his works. Of these he himself published seven—the first in 1560, the last in 1609. During 1560 and the years 1561 to 1563 his ten more complete editions were published, the most famous of which is the folio of 1560. A copy of this, presented by Sainte-Beuve to Victor Hugo, and later in the possession of M. Maxime du Camp, has a place of its own in French Bibliography. The work of C. Binet in 1589, דווק about the life and works of Ronsard, is very worth the early information, and the author seems to have revised some of Ronsard's work under the poet's own direction. From 1530 Ronsard was not again reprinted for more than two centuries. Just before the close of the second, however, Sainte-Beuve printed a selection of his poems to accompany the above-mentioned Tableau (1828).

There are also selections by M. Noël (in the Collection Dido) and Becc de Fouquieres. In 1857 M. Prosper Blanchelain, who had prepared new bibliographical tables, published a volume of Mélanges inédits, and undertook a complete edition for the Bibliothèque Élyséenne. The eighth and last volume of this appeared ten years later. It is practically complete; a piece of a somewhat free character which has been cut out, and some corrections which are partially excluded. A later and better edition still is that of M. Lavaule (1887–1893), and another that of B. Pitteau (1901). As for criticism, Sainte-Beuve followed up his early work by articles in the Casseaux des Écrivains, the chief lacuna of which is the complete critical work with which that of M. W. de Sainte-Croix (1905) is now perfected.

Books may be mentioned those of E. Gandar (Métz, 1854), which considers him chiefly in his relation to the ancients, and M. Lisseau, in P. de Vigni (1606), M. Ronsard (1606), and Ronsard (1608); M. G. Bizzoz, Ronsard (1894); the Abbé Froger, Les Premières poésies de Ronsard (1859); L. Mellerio, Lexique de Ronsard (1865); P. Perdizet, Ronsard et la réforme (1902), with a still more complete criticism in M. CoDlenz, Ronsard et sa mémoire (1909); and M. Lemoine. In English Mr A. Talley's Literature of the French Renaissance may be consulted, and on Ronsard's critical standpoint Saintsbury's History of Criticism, vol. ii. (G. S.A.)

RONSORD,—a town of Germany, in the Prussian Rhine province, on the Morsbach, a small affluent of the Rhine, 18 m. E. of Düsseldorf, and 5 m. S. of Elberfeld-Barmen by rail. Pop. (1905) 14,005. It is the seat of iron, steel, and copper industries, besides carrying on extensive manufactures of ribbons, trimmings, and silk goods generally. It also has breweries, distilleries, and electrical works.

Founded in 1377 by the followers of Elias Eller, a religious enthusiast, Ronsord received civic rights in 1745. The Ronsord sect, the members of which called themselves Zionsites, is now extinct. 

RÖNTGEN, DAVID, sometimes called DAVID DE LUNEVILLE (1743–1807), German cabinet-maker, eldest son of Abraham Röntgen, was born at Herrnhag. In 1753 his father migrated to the Moravian settlement at Neuweil, near Coblenz, where he established a furniture factory. He learned his trade in his father's workshop, and succeeded to the partnership in 1772, when he entered into some kind of partnership with the clock-maker Kintzing. At that time the name of the firm appears already to have been well known, at all events in France; but it is a curious circumstance that although he is always reckoned as one of the little band of foreign cabinet-makers and workers in marquetry who, like Oeben and Riesener, achieved distinction in France during the superb floraison of the Louis Seize style, he never ceased to live at Neuweil, where apparently the whole of his furniture was made, and merely had a shop, or shop-house, in Paris. We have, as it happens, a record of his first appearance there. The engraver Streltze enters in his journal of August 30, 1774, that " M. Röntgen, célèbre ébéniste, établi à Neuweil, près de Coblenz, m'est venu écrire, en m'apportant une lettre de recommandation de M. Zick, peintre à Coblenz. . . Comme M. Röntgen connaissait personne à Paris, je lui fus utile en lui enseignant quelques sculpteurs et dessinateurs dont il avait besoin."

Röntgen was first and foremost an astute man of business and it is not improbable that the moving cause of this opening up of relations with Paris was the accession to the throne of Marie Antoinette, whose Teutonic sympathies were only too well known. Before very long she appointed him her ébéniste-mécanicien. He appears, indeed, to have acquired considerable favour with the queen, for on several occasions she took advantage of his journeys through Europe to charge him with the delivery of presents and of dolls dressed in the Paris fashions of the moment—they were intended to serve as patterns for the dressmakers—to her mother and her sisters. He appears at once to have opened a shop in Paris, but despite, and perhaps because of, the favour in which he was held at court, all was not plain sailing. The powerful trade corporation of the maîtres-ébénistes disputed his right to sell in Paris furniture of foreign manufacture, and in 1780 he found that the most satisfactory way out of the difficulty was to himself admitted a member of the corporation to which all his great rivals belonged. By this time he had attracted a good deal of attention by the introduction of a new style of marquetry, in which light and shade, instead of being represented as hitherto by burning, smoking or engraving the materials, were indicated by small pieces of wood so arranged as to create the impression of legitimate wood. We have seen that Röntgen had been appointed ébéniste-mécanicien of the queen; the appointment is explained by his fondness for and proficiency in constructing furniture in which mechanical devices played a great part. The English cabinet-makers of the later eighteenth century often made what was called, with obvious allusion to its character, "harlequin furniture," especially little dressing-tables and washstands which converted something else or held their essentials in concealment until a spring was touched. David was a past master in this kind of work, and unquestionably much of the otherwise inexplicable reputation he enjoyed among contemporaries who were head and shoulders above him is explained by his mechanical genius. The extent of his fame in this direction is sufficiently indicated by the fact that Goethe mentions him in Wilhelm Meister. He compares the box inhabited by the fairy during her travels with her mortal lover to one of Röntgen's desks, in which "at a pull a multitude of springs and latches are set in motion." For a desk of this kind Louis XVI. paid him 80,000 livres. Outwardly it was in the form of a commode, its marquetry panels symbolizing the liberal arts. A personification of sculpture was in the act of engraving the name of Marie Antoinette upon a column to which Minerva was hanging her portrait. Above a riot of architectural orders was a musical clock (the work of the partner Kintzing), surmounted by a cupola representing Parthenos. The interior of this monumental effort, 11 ft. high, was a marvel of mechanical precision; it disappeared during the First Empire. Röntgen did not confine his activities to Paris, or even to France. It has been said that he travelled about Europe accompanied by furniture vans, and undoubtedly his aptitude as a commercial traveller was remarkable. He was at one time in London and at Petersburg, and himself apparently twice went to Russia. On one of his journeys to St. Petersburg he presented the Empress Catherine furniture to the value of 20,000 roubles, to which she added a personal present of 5000 roubles and a gold snuff-box—in recognition, it would seem, of his readiness and ingenuity in surmounting a secretary with a clock indicating the date of the Russian naval victory over the Turks at Chesme, news of which had arrived on the previous evening. This suite of furniture is believed still to be in the Palace of the Hermitage, the hiding-place of so much remarkable and forgotten art. To the protection of the queen of France and the empress of Russia David added that of the king of Prussia, Frederick William II., who in 1792 made him a Commerzienrat and commercial agent for the Lower Rhine district. The French Revolution and the Napoleonic Wars which so speedily followed, eclipsed Röntgen's star as they eclipsed those of so many other great cabinet-makers of the period. In 1793 the Revolutionary government, regarding him as an émigré, seized the contents
of his show-rooms and his personal belongings, and after that date he appears neither to have done business in Paris nor to have visited it. Five years later the invasion of Neuwied led to the closing of his workshops; prosperity never returned, and he died half ruined at Wiesbaden on the 12th of February 1807.

Röntgen was not a great cabinet-maker. His forms were often clumsy, ungraceful and commonplace; his furniture lacked the artistry of the French and the English cabinet-makers of the great period which came to an end about 1790. His bronzes were poor in design and coarse in execution—his work, in short, is tainted by commercialism. As a marqueteur, however, he holds a position of high distinction. His marquetry is bolder and more vigorous than that of Riesener, who in other respects soared far above him. As an adroit deviser of mechanism he fully earned a reputation which forms more than six hundred and ninety-five, and more recently, one hundred and forty-four, pieces on his facilities for comparison, is prepared to accept. On the mechanical side he produced, with the help of Kintzing, many long-cased and other clocks with ingenious indicating and registering apparatus. Röntgen delighted in architectural forms, and his marquetry more often than not represents those scenes from classical mythology which were the dear delight of the 18th century. He is well represented at South Kensington.

RÖNTGEN, WILHELM KONRAD (1845—), German physicist, was born at Lennep on the 27th of March 1845. He received his early education in Holland, and then went to study at Zürich, where he took his doctor's degree in 1869. He then became assistant to Kundt at Würzburg and afterwards at Strassburg, becoming privat-docent of physics at the Agricultural Academy of Hohenheim, and in 1876 he returned to Strassburg as extraordinary professor. In 1879 he was chosen ordinary professor of physics and director of the Physical Institute at Giessen, whence in 1883 he removed to the same capacity to Würzburg. It was at the latter place that he made the discovery for which his name is chiefly known, the Röntgen rays. In 1895, while experimenting with a highly exhausted vacuum tube on the conduction of electricity through gases, he noticed that a paper screen covered with barium platinocyanide, which happened to be lying near, became fluorescent under the action of some radiation emitted from the tube, which at the time was enclosed in a box of black cardboard. Further investigation showed that this radiation had the power of passing through various substances which, and continue to obstruct light, and thus of affecting a photographic plate. Its behaviour being curious in several respects, particularly in regard to reflection and refraction, doubt arose in his mind whether it was to be looked upon as light or not, and he was led to put forward the hypothesis that it was due to longitudinal vibrations in the ether, not to transverse ones like ordinary light; but in view of the uncertainty existing as to its nature, he called it X-rays. For this discovery he received the Rumford medal of the Royal Society in 1896, jointly with Philip Lenard, who had already shown, as also had Hertz, that a portion of the cathode rays could pass through a thin film of a metal such as aluminium. Röntgen also conducted researches in various other branches of physics, including elasticity, capillarity, the conduction of heat in crystals, the absorption of heat-rays by different gases, piezo-electricity, the electromagnetic rotation of polarized light, and the action of light on vegetable life.

RÖNTGEN RAYS, W. K. Röntgen discovered in 1895 (Wied. Ann. 64, p. 1) that when the electric discharge passes through a tube exhausted so that the glass of the tube is brightly phosphorescent, phosphorescent substances such as potassium platinocyanide became luminous when brought near to the tube. He found that if a thick piece of metal, a coin for example, were placed between the tube and a plate covered with the phosphorescent substance a sharp shadow of the metal was cast upon the plate; pieces of wood or thin plates of aluminium cast, however, only partial shadows, thus showing that the agent which produced the phosphorescence could traverse with considerable freedom bodies opaque to ordinary light. He found that as a general rule the greater the density of the substance the greater its opacity to this agent. Thus while this effect could pass through the flesh it was stopped by the bones, so that if the hand were held between the discharge tube and a phosphorescent screen the outline of the bones was distinctly visible as a shadow cast upon the screen, or if a purse containing coins were placed between the tube and the screen the purse itself cast but little shadow while the coins cast a very dark one. Röntgen showed that the cause of the phosphorescence, now called Röntgen rays, is propagated in straight lines starting from places where the cathode rays strike against a solid obstacle, and the direction of propagation is not bent when the rays pass from one medium to another, i.e. there is no refraction of the rays. These rays, unlike cathode rays or Canalsstrohen, are not deflected by magnetic force; Röntgen could not detect any deflection with the strongest magnets at his disposal, and later experiments made with stronger magnetic fields have failed to reveal any effect of the magnet on the rays. The rays affect a photographic plate as well as a phosphorescent screen, and shadow photographs can be readily taken. The time of exposure required depends upon the intensity of the rays, and this depends upon the state of the tube, and the electric current going through it, as well as upon the substances traversed by the rays on their journey to the photographic plate. In some cases an exposure of a few seconds is sufficient, in others hours may be required. The rays coming from different discharge tubes vary in power and intensity and in the degree of penetration. If the pressure in the tube is fairly high so that the potential difference between its electrodes is small, and the velocity of the cathode rays in consequence small, the Röntgen rays coming from the tube will be very easily absorbed; such rays are called "soft rays." If the exhaustion of the tube is carried further, so that there is a considerable increase in the potential differences between the cathode and the anode in the tube and therefore in the velocity of the cathode rays, the Röntgen rays have much greater penetrating power and are called "hard rays." With a highly exhausted tube and a powerful induction coil it is possible to get appreciable effects from rays which have passed through sheets of brass or iron several millimetres thick. The penetrating power of the rays thus varies with the pressure in the tube; as this pressure gradually diminishes when the discharge is kept running through the tube, the type of Röntgen ray coming from the tube is continually changing. The lowering of pressure due to the current through the tube finally leads to such a high degree of exhaustion that the discharge has great difficulty in passing, and the emission of the rays becomes very irregular. Heating the walls of the tube causes some gas to come off the sides, and by thus increasing the pressure creates a temporary improvement. A thin-walled platinum tube is sometimes fused on to the discharge tube to remedy this defect; red-hot platinum allows hydrogen to pass through it, so that if the platinum tube is heated, hydrogen from the flame will pass into the discharge tube and increase the pressure. In this way hydrogen may be introduced into the tube when the pressure gets too low. When liquid air is available the pressure in the tube may be kept constant by fusing on to the discharge tube a tube containing charcoal; this dips into a vessel containing liquid air, and the charcoal will be kept at the temperature of the liquid air to maintain the tube. Not only do bulbs emit different types of rays at different times, but the same bulb emits at the same time rays of different kinds. The property by which it is most convenient to identify a ray is the absorption it suffers when it passes through a given thickness of aluminium or tin-foil. Experiments made by McClelland and Sir J. J. Thomson on the absorption of the rays produced by sheets of tin-foil showed that the absorption by the first sheets of tin-foil traversed by the rays was much greater than that by the same number of sheets when the rays had already passed through several sheets of the foil. The effect is just what would occur if some of the rays were much more readily absorbed by the tin-foil than others, for the first few layers would stop all the easily absorbable rays while the ones left would be those that were but little absorbed by tin-foil.
The fact that the rays when they pass through a gas ionize it and make it a conductor of electricity furnishes the best means of measuring their intensity, as the measurement of the amount of conductivity they produce in a gas is both more accurate and more convenient than the method of measuring the effect on the photographic or phosphorescent effects. Röntgen rays when they pass through matter—such as Perrin (Comptes rendus, 124, p. 455), Sagnac (Jour. de Phys., 1899, (3), 8, and J. Townsend (Proc. Camb. Phil. Soc., 1899, 10, p. 217) have shown—that the Röntgen rays, or cathode rays, are not absorbed by the material. A complete investigation of this subject has been made by Barkla and Sadler (Barkla, Phil. Mag., June 1906, pp. 812–828; Barkla and Sadler, Phil. Mag., October 1906, pp. 550–554; Sadler, Phil. Mag., 1906, 107; Sadler, Phil. Mag., 1907, 18). They have shown that the secondary Röntgen rays are of two kinds; one kind is of the same type as the primary incident ray and may be regarded as scattered primary rays, the other kind depends only on the material struck by the rays, and its intensity is independent of that of the incident ray. When the atomic weight of the element exposed to the primary rays was less than that of calcium, Barkla and Sadler could only detect the first type of ray, i.e., the secondary radiation consisted entirely of scattered primary radiation; elements with atomic weights greater than that of calcium gave out, in addition to the scattered primary radiation, Röntgen rays characteristic of the element and independent of the quality of the primary rays. The higher the atomic weight of the metal the more penetrating are the characteristic rays it gives out. This is shown in the table, which gives for the different elements the reciprocal of the distance, measured in centimeters, through which the rays from their elements can pass through air before being absorbed. It gives us, for example, the means of getting homogeneous Röntgen radiation of a perfectly definite type: it is also of fundamental importance in connection with any theory of the Röntgen rays. We have seen that there is no evidence of retraction of the Röntgen rays and it would be interesting to try if this were the case when the rays passing through the refracting substance are those characteristic of the substance.

Secondary Cathodic Rays.—The incidence of Röntgen rays on matter causes the matter to emit cathodic rays. The velocity of these rays is independent of the intensity of the primary Röntgen rays, but depends upon the hardness of the rays; it seems also to be independent of the nature of the matter exposed to the primary rays. The velocity of the cathodic rays increases with the hardness of the primary rays. Innes (Proc. Roy. Soc. Soc. 70, p. 442) measured the velocity of the cathodic radiation excited by the rays from Röntgen tubes, and found velocities varying from 6.2×10^{10} cm/sec. to 8.3×10^{10} cm/sec. according to the hardness of the rays given out by the tube. The cathodic rays given out under the action of the homogeneous secondary Röntgen radiation characteristic of the different elements have been studied by Sadler (Phil. Mag., March 1910) and Beatty (Phil. Mag., August 1910). The following table gives the properties of the cathode rays excited by the radiation from various elements as taken from Beatty's paper; \( \lambda \) is the thickness of air at atmospheric pressure and temperature required to absorb one-half of the energy of the cathode particles, \( \lambda \) is the corresponding quantity for hydrogen.

The radiation from chromium cannot pass through more than a few centimeters of air without being absorbed, while that from iron is as penetrating as that given out by a fairly efficient Röntgen tube. Barkla and Sadler found that the radiation characteristic of the metal is not excited unless the primary radiation is more penetrating than the characteristic radiation of the metal. It is not possible for radiation from iron to excite the characteristic radiation from iron, but the characteristic radiation from iron cannot excite that from silver. We may compare this result with Stokes's rule for phosphorescence, that the wave-length of the fluorescent light is of longer wave-length than the light which excites it.

The discovery that each element gives out a characteristic radiation (or, as still more recent work indicates, a line spectrum of characteristic radiation) is one of the most important. It gives us, for example, the means of getting homogeneous Röntgen radiation of a perfectly definite type: it is also of fundamental importance in connection with any theory of the Röntgen rays. We have seen that there is no evidence of retraction of the Röntgen rays and it would be interesting to try if this were the case when the rays passing through the refracting substance are those characteristic of the substance.

Absorption of Röntgen Rays.—The wide variations in the penetrating power of Röntgen rays from different sources is shown by the above table of the penetrating power of the characteristic rays of the different elements. Many experiments have been made on the penetration of the same rays for different substances. It is a rule which there is no well-established exception that the greater the density of the substance the greater is its power of absorbing the rays. The connection, however, between the absorption and the density of the substance is not in general a simple one, though there is evidence that for exceedingly hard rays the absorption is proportional to the density.

The power of any material to absorb rays is usually measured by a coefficient \( \lambda \), the definition of which is that a plate 1 cm thick absorbs the energy of the rays to the depth \( \lambda \); in other words, \( \lambda \) is the ratio of the values of \( \lambda /D \) given when the density of material is increased by passing it normally to 1/e of its original value, where \( e \) is the base of the Napierian logarithms and equal to 2.718. It has been shown that however the physical state of a substance may alter,—if, for example, it changes from the liquid to the gaseous state,—\( \lambda /D \) is the density of the substance, remains constant. It has also been shown that if we have a mass \( M \) made up of masses \( M_1, M_2, M_3 \), etc., of substances having coefficients of absorption \( \alpha_1, \alpha_2, \alpha_3 \), etc., and densities \( D_1, D_2, D_3 \), then if \( \lambda /D \) for the mixture is given by the equation

\[
\frac{\lambda}{D} = M_1\alpha_1/D_1 + M_2\alpha_2/D_2 + M_3\alpha_3/D_3 + \ldots
\]

this equation is true whether the substances are chemically combined or chemically mixed. From this equation, when we know \( \lambda /D \) for any compound and for one of its constituents, we can find the value of \( \lambda /D \) for the other constituent. By the use of this principle we can find the value of \( \lambda /D \) for the elements which cannot be obtained in a free state. Benoist (Jour. de Phys. (7), 25), has shown that if the values of \( \lambda /D \) and \( \alpha \) are known for all the atomic weight we get a smooth curve; if we draw this curve it is evident that we have the means of determining the atomic weight of an element by measuring its transparency to Röntgen rays when in combination with elements whose transparency is known. Benoist has applied this method to determine the atomic weight of iodium.

The value of \( \lambda /D \) for any one substance depends upon the type of ray used, and the ratio of the values of \( \lambda /D \) for two substances is the greatest possible, if we can, in combination with these substances, find that \( \alpha \) for one of the substances is hydrogen. Thus Crowther (Proc. Roy. Soc. Soc. March 1909) has shown that the ratio of \( \lambda /D \) for air to \( \alpha \) for hydrogen varied from 100 for rays given out by a Röntgen tube of 150 cm radius, to 500 for rays of 6 cm radius. The comparison of these ratios is very soft to 5.56 when the pressure in the bulb was very low and the rays very hard. Beatty (Phil. Mag., August 1910) found that this ratio was as large as 175 for the characteristic rays given out by iron, copper, zinc and arsenic, but fell to 25·0 for the rays from tin.

Polarisation of Röntgen Rays.—A great deal of attention has been paid to a phenomenon called the polarisation of the
Röntgen rays. The nature of this effect may be illustrated by fig. 1. Suppose that AB is a stream of cathode rays striking against a solid obstacle B and giving rise to Röntgen rays, let these rays impinge on a small body P, under these conditions will emit secondary rays in all directions. Barkla (Phil. Trans., 1905, A, 204, p. 457; Proc. Roy. Soc. 77, p. 247) found that the intensity of the secondary rays, tested by the ionization they produced in air, was less intense in the plane AB than in a plane through PB at right angles to this plane, the distances from P being the same in the two cases; the difference in the intensities amounting to about 15%. Haga (Ann. d. Phys. 28, p. 439), who tried a similar experiment but used a photographic method to measure the intensity of the secondary rays, could not detect any difference in the plane AB, but experiments by Bassler (Ann. der Phys. 28, p. 808) and Vegard (Proc. Roy. Soc. 83, p. 379) have confirmed Barkla's original observations.

The "polarization" is much more marked if instead of exciting the secondary radiation in P by the Röntgen rays from a discharge tube, it is produced by means of a secondary radiation, for example, as is the case illustrated by fig. 1 we allow a beam of Röntgen rays to fall upon B instead of the cathode rays, the difference between the intensities in the plane AB and in the plane at right angles to it is very much increased. It is only the scattered secondary radiation which shows this "polarization"; the characteristic secondary radiation emitted by the body at P is quite unpolarized. The existence of this effect has a very important bearing on the nature of the Röntgen rays, for it shows that if the Röntgen rays are of any form of light, i.e. are some form of electromagnetic disturbance propagated through the aether, it is a question on which opinion is not unanimous. They resemble light in their rectilinear propagation; they are polarized by a plate at an angle of 90°, as are the ordinary electric rays produced by the phosphorescence produced by ultra-violet light, and the cathode secondary rays with the photo-electric effect. The absence of refraction is not an argument against the rays being of light, for, all through the change in medium this property depends upon the relation between the natural time of vibration T of the refracting substance and the period t of the light vibrations, the refraction vanishing when T/2t is very small. Thus there would be no refraction for light of a very small period and this would be true if, instead of regular periodic oscillations we had a pulse of electromagnetic disturbance, provided the time taken by the light to travel over the thickness of the plate is small compared with the periods of vibration of the molecules. Experiments on the refraction of Röntgen rays are very difficult, for, in addition to the difficulties caused by the smallness of the wavelength or the thinness of the pulse, the secondary radiation produced when the rays strike against a photographic plate is so weak that air might give rise to what might equally be mistaken for diffraction effects. Barkla has never succeeded in observing effects which prove the existence of diffraction. Fomm (Wied. Ann. 59, p. 50) observed in the photograph of a narrow slit light and dark bands which looked like diffraction bands; but observation with slits of different sizes showed that they were not of this nature, and Haga and Wind (Wied. Ann. 68, p. 884) have explained them as contrast effects. These observers, however, noticed with a very narrow width when the edge of the path of the Röntgen rays or a narrow slit, which they are satisfied could not be explained by the causes. Walter and Pohl (Ann. der Phys. 29, p. 331) could not observe any diffraction effects, though their arrangement would have been sufficient for the usefulness of the path-length had not been smaller than 1.5 x 10⁻⁹ cm. Mr George Stokes (Proc. Manchester Lit. and Phil. Soc., 1898) put forward the view that the disturbances which constitute the rays are not regular periodic undulations but very thin pulses. Thomson (Phil. Mag. 45, p. 172) thought that the particles are suddenly stopped, pulses of very intense electric and magnetic disturbances are started. As the cathode rays consist of negatively electrified particles, the impact of these on a solid would give rise to such intense pulses. The electromagnetic theory therefore shows that effects resembling light, inasmuch as they are electromagnetic disturbances propagated through the aether, must be produced when the cathode rays strike against an obstacle. Since under these circumstances Röntgen rays are produced, it

ROOD

seems natural, unless direct evidence to the contrary is obtained, to connect the Röntgen rays with these pulses. This view explains very simply the "polarization" of the rays; for, suppose the cathode particle moving from A to B were stopped at its first impact with the plate B (fig. 1), the electric force along AB would be in the plane AB at right angles to PB. When this electric force reached the body at P it would accelerate any electrified particles in that body, the acceleration being parallel to AB. Each of these accelerated particles would start electric waves. The theory of such waves shows that their intensity vanishes along a line through the particle parallel to the direction of acceleration, while it is a maximum at right angles to this line; thus the intensity of the waves along a horizontal line would be zero, while it would be a maximum in the plane at right angles to this line. In this case there would be complete polarization. In reality the cathode particle is not stopped at its first encounter, but makes many collisions. Each of these collisions will send out electric disturbances which when they fall on P are able to excite waves which send some energy along PC. The polarization will therefore be only partial and will be of the kind by B.

The velocity with which the waves travel has not yet been definitely settled. Marx (Ann. der Phys. 20, p. 677) by an ingenious and elaborate method came to the conclusion that they travelled with the velocity of light; his interpretation of his experiments has, however, been criticized by Franck and Pohl (Verh. d. D. Physik Ges. 10, p. 489).

Another view of the nature of Röntgen rays has been advanced by Porter (Phil. Mag., 14, p. 498); he regards them as electric and magnetic disturbances of the aether of opposite charge which are usually held together by the attraction between them, but which may be knocked asunder when the rays strike against matter and turned into cathode rays. On this view when the electric rays travel through a gas the molecules are struck by the rays and so can be easily understood why so few of the molecules are ionized. On the ordinary view of an electric wave the all the molecules would be affected by the wave when it passed through a gas, and to explain the small fraction ionized one must either suppose that systems sensitive to the Röntgen rays are at any time present only in a very small fraction of the molecules or else that all the front of an electric or light wave is not continuous but that it is formed by a series of patches which occupy a fraction of the wave front.

Apparatus for producing Röntgen Rays.—The tube now most frequently for producing Röntgen rays is of the kind introduced by Porte and known as the focus tube (fig. 2). The cathode is a portion of a hollow sphere, and the cathode rays come to a point on or near a conductor at a small distance from the cathode, generally the anode-cathode, connected with the anode; this plate is the source of the rays. They are then absorbed by a very unabsorbable metal such as platinum or, still better, tautalum and kept cool by the water passing through the water-jacket. The intensity is greatly increased at an angle of 45° to the rays; it is probable that the action of the tube would be improved by putting the anti-cathode at right angles to the cathode rays. The walls of the tube get strongly electric. This electrocrystallization affects the working of the tube, and the production of rays can often be improved by having an earth-connected piece of tin-foil on the outside of the bulb, and moving it about until the best position is attained. To produce the discharge an induction coil is generally employed with a mercury interrupter. Excellent results have been obtained by using an electrostatic induction machine to produce the current, the emission of rays being produced by putting a large metallic plate in the path of the rays. The rays are emitted pretty uniformly in all directions until the plane of the anti-cathode is approached; in the neighbourhood of this plane there is a rapid falling off in the intensity of the rays. After long use the glass of the bulb often becomes distinctly purple. This is believed to be due to the presence of manganese compounds in the glass.

(J. F. T.)

ROOD (O.E. rod, a stick, another form of "rod"); O.E. rodd, possibly cognate with Lat. radus, a staff), properly a rod or pole, and so used as the name of a surface measure of land. The rod varies locally but is generally taken as = 40 square rods, poles or perches; 4 rods = 1 acre. The term was, however, particularly applied, in O.E. to a general or crookedly bent
(see SCREEN), which divides the chancel or the choir from the nave. The rood was carried either on a transverse beam, the "rood beam," or by a gallery, the "rood loft." Such a gallery was also used as a place from which to read portions of the service (see JUBÉ). It was reached by the "rood stair," a small winding stair or "vice." In English churches these stairs generally run up in a small turret in the wall at the west end of the chancel; often this also leads out to the roof. On the continent of Europe they often lead out of the interior of the church and are enclosed with tracery, as at Rouen or Strassburg. "Rood stairs" remain in many English churches where the rood loft has been destroyed. A fine example of a rood loft is at Charlton-on-Otmoor, Oxfordshire. The screen might be separate from the rood beam or rood loft. The general construction of wooden screens is close panelling beneath, on which stands screen-work composed of slender turned balusters or regular wooden mullions, supporting tracery more or less rich with cornices, cresteings, &c., and often painted in brilliant colours and gilded. The central tower of a church over the intersection of the nave and chancel with the transepts is sometimes called the "rood tower"; an example is that at Notre Dame at Paris. In England rood lofts do not appear to have been introduced before the 14th century, and were not common till the 15th. The "roods" themselves were not disturbed in Henry VIII's reign, but were generally removed under Edward VI. and Elizabeth.

The legality of rood screens or rood lofts in the Church of England depends on the law of the Church with regard to images, i.e. whether they do or do not, or will or will not, encourage or lead to idolatrous or superstitious worship in the place where they are, or are to be put." (Lindley, L. 7. in R. v. Bishop of London, 1889, 24 Q.B.D. 213, 237; see also St. John Timberhill, Norwich, case, 1889 Prob. 71, and article IMAGE).

ROOFS. A roof is a construction placed as a covering over the upper portion of a building to exclude the weather and preserve the contents dry and uninjured. Roofs are designed to throw off rain and snow, and their slope or "pitch," as it is generally termed, is governed to a great extent by the climate, as well as by the material used and manner of laying. The pitch may vary from an almost horizontal surface (as largely adopted in dry countries and also in temperate climates for roofs of metal or asphalt) to the steeply pitched roofs required for the ordinary flat tiles which to be weatherproof must be laid at an angle of from 45° to 80° with the horizon. Besides serving the useful purpose of protection against inclement weather the roof, both externally and internally, may be designed to form an architectural feature in keeping with the character of the building.

The simplest form is the "flat roof" consisting of horizontal wood joists laid from wall to wall as in floor construction. The roof must not be quite flat, for a slight fall is necessary in its upper surface to allow water to drain away into gutters placed at convenient points. The joists are covered with a waterproof material such as asphalt, lead, zinc or copper, the three last materials being usually laid upon boarding, which stiffens the structure and forms a good surface to fix the weatherproof covering upon. Such roofs are not suitable for cold climates, for accumulations of snow might overburden the structure and would also cause the wet to penetrate through any small crevices and under flashings. With flat roofs the pressure exerted upon the supports is directly vertical.

"Lean-to," "shed," or "pent" roofs are practically developments of the flat roof, one end of the joists (which are now called "rafters") being tipped up to form a decided slope, which enables slates, tiles, corrugated iron and other materials to be employed which cannot be used upon a "flat" roof.

Simple roofs in general use with a double slope are the "coupled rafter roofs," the rafters meeting at the highest point upon a horizontal ridge-piece which stiffens the framework and gives a level ridge-line. In some old roofs the rafters are connected without any intervening ridge-plate, with the result that after a time the ridge instead of remaining level takes on a wavy outline, due to the fact that some of the timbers have settled slightly owing to decay or other causes, whilst others have remained firm in their places. The lower ends of the rafters should pitch on a wood plate bedded on top of the wall; this, as described under CARPENTRY, assists in spreading the weight over a large area of the wall, and provides good fixing for the timbers. The simple "couple roof" consists merely of two sets of rafters pitched from plates on the walls on either side of the building and sloping upwards to rest against a common ridge-piece. There are no ties between the feet of the rafters, which therefore exert a considerable thrust against the supporting walls. On account of this and of the lack of rigidity of the framing this form of roof should only be used to cover small spans of 10 to 12 ft. Generally the ends of the rafters are connected by ceiling joists which form a level ceiling and at the same time prevent any outward thrust on the supports. When used for spans between 12 ft. and 18 ft. a binder supported by an iron or wood "king" tie every 5 or 6 ft. should be run along across the centres of the ceiling joists and the latter spiked to it. Such roofs with the wood tie across the feet of the rafters are termed "couple close roofs." When the ties are fixed about half-way up the rafters it is called a "collar roof," and may be used for spans up to 16 ft. These are the type of roof commonly used in ordinary dwelling-houses where the
In such large spans the straining beam often becomes of such a length as to require support and this is effected by continuing the principal rafters up to the ridge and introducing a short king-post to sustain the beam in the middle of its length.

Open timber roofs of various types but principally Open timber roofs, construction were used in the middle ages where stone vaulting was not employed. Many of these old roofs still exist in good preservation and exhibit the great skill of the medieval carpenters who designed and erected them. Such forms are still used, chiefly for ecclesiastical buildings and the roofs over large halls. In the best periods of Gothic architecture the pitch of these roofs was made very steep, sometimes as much as 60° with the horizon. In the hammer-beam type of roof the tie-beam at the foot of the rafters is omitted, a collar being thrown across connecting the principal rafters at a point about half-way in their length, the lower portion of the principal consisting of a number of struts and braces rigidly connected in such a manner as to throw as little thrust as possible upon the walls serving as abutments.

There are two kinds of hammer beams, the arched and the bracketed; the chief examples are Westminster Hall and Middle Temple Hall (Plate 1, figs. 24 and 25). The hammer beam projects from the top of the wall and is bracketed from a corbel projecting from the wall some distance below. This form of roof has a style and dignity of its own, and gives greater height in the upper part of the building as well as being more ornamental and lighter in effect than tie-beam trusses, which have a rather heavy effect.
Fig. 24.—WESTMINSTER HALL.

Fig. 25.—HALL OF THE MIDDLE TEMPLE.
The Mansard roof (fig. 5) is a useful form of construction which obtains its name from François Mansard, a distinguished French architect who lived in the 17th century. This kind of roof has been largely used, especially in France and other European countries, as well as in America in the old colonial days. It adapts itself well to some styles of architecture, but should be very carefully applied, since it is apt to appear ungainly in some situations. By the use of a Mansard roof extra rooms can be obtained at a small expense without adding an additional storey to the building proper. The outward thrust upon the supporting walls is not so great as with an ordinary pitched roof, the load coming practically vertically upon them. There is no recognized rule for the proportion or pitch of a roof of this description, which should be designed to suit the particular building it is intended to cover. Fig. 5 A, B, C, D and E show various forms. A similar type of curb roof is often used having a flat lead- or zinc-covered top in place of the pitched slate- or tile-covered top of the ordinary Mansard roof.

Composite roof trusses of wood and iron are frequently used for all classes of buildings, and have proved very satisfactory. They are built upon the same principles as wooden types of roof trusses. The struts—that is, those members subjected to compressional stress—are of wood, and iron bars or rods are used for the ties, which have to withstand tensile forces. When any shrinkage occurs to loosen the joints of the framing, as usually happens in large trusses, the tie-rods are tightened up by the bolts attached to them. Figs. 6, 7 and 8 are the sections and plan of a simple method of constructing the roof for an ordinary domestic building with plaster ceilings to the smallest size compatible with safety. In this way any unnecessary surplus of material is avoided, and so is the heavy, overwhelming effect noticeable in many roofs of large span. There is an entire absence of long wide plates and webs; the various members are composed wholly of flat bars and angle irons riveted together, and plates are introduced only where required to cover joints. Some notes on its size and construction...
Domes may be framed up with wood rafters cut to shape. For small spans this construction is satisfactory, but when the dome is of considerable size it is often framed in steel as being stronger and more rigid than wood, and therefore not exerting so great a thrust upon the supporting walls. The outer dome of St Paul's cathedral in London is of lead-covered wood, framed upon and supported by a conical structure of brickwork which is raised above the inner dome of brick. Concrete is a very suitable material for use in the construction of domes, and may be employed simply or with iron or steel reinforcement in the shape of wires, bars or perforated plates. One of the best modern examples of concrete vaulting and domical roofing without metal reinforcement occurs in the Roman Catholic cathedral at Westminster, a remarkable building designed by Mr J. F. Bentley. A few details of the roofs will be interesting. The circle developed by the pendentives of the nave domes is 60 ft. in diameter. The thickness of the domes at the springing is 3 ft. gradually reduced to 13 in. at the crown; the curve of equilibrium is therefore well within the material. The domes were turned on closely boarded centring in a series of superimposed rings of concrete averaging 4 ft. in width. The concrete is not reinforced in any way. The independent external covering of the domes is formed of 3 in. artificial stone slabs cast to the curve. They rest on radiating ribs 5 in. deep of similar material fixed on the concrete and rebated to receive the slabs; thus an air space of 2 in. is left between the inner shell and the outer covering, the object being to render the temperature of the interior more uniform. At the springing and at the
Roofing felt is an inexpensive fabric of animal or vegetable fibre treated with asphalt to make it capable of resisting the weather. It is largely used as a roofing material for temporary buildings. When exposed to the weather it should be treated with an application of a compound of tar and slaked lime well boiled and applied hot; the surface being sprinkled with sand before it becomes hard. Felt is also used on permanent buildings as a good non-conductor of heat under slating and other roof-covering materials. In this case it is not tarred and sanded. It is supplied in rolls containing from 25 to 35 yds. 30 in. wide. The sheets should be laid with a lap of 2 in. at the joints and secured to the boarding beneath by large-headed clout-nails driven in about 2 in. apart.

Corrugated iron is supplied either black or galvanized. It is especially suited for the roofs of outbuildings and buildings of a more or less temporary character. Being to a large extent self-supporting, it requires a specially designed roof framework of light construction. If, as is usually the case, the sheets are laid with the corrugations running with the slope of the roof, they can be fixed directly on purlins spaced 5 ft. to 10 ft. apart according to the stiffness and length of the sheets.

Covering Materials for Roofs.—There are a large number of different roof-covering materials in common use, of which short descriptions, giving the principal characteristics, may be useful. The nature of the material employed as the outer covering affects the details of roof construction very considerably. A light covering such as felt or corrugated iron can be safely laid upon a much lighter timber framing than is necessary for a heavy covering of tiles or slates.

Fig. 9.—Queen-rod Roof Truss.

Fig. 10.—Roof at Cardiff Station.
pure air zinc coating of the galvanized sheets is durable for many years, but in large cities and manufacturing towns its life is short unless protected by painting. In such districts it has often been found that plain ungalvanized sheets well coated with paint will last longer than those galvanized, for the latter are attacked by corrosive influences through minute flaws in the zinc coating developed in the process of corrugation or resulting from some defect in the coating. The stock sizes of corrugated sheets vary from 5 ft. to 10 ft. long, and from 2 ft. to 2 ft. 9 in. wide with corrugations measuring 3 in. to 5 in. from centre to centre. For roofing purposes the sheets are supplied in several thicknesses ranging from No. 16 to No. 22 Standard Wire Gauge. No. 16 is for exceptionally strong work, No. 18 and No. 20 are used for good-class work, and No. 22 for the roofs of temporary buildings. The sheets when laid should lap about 3 in. at their sides and from 3 in. to 6 in. at the ends. Riveting is the best method of connecting the sheets, although galvanized bolts, which are not so satisfactory, are frequently employed. The joints should be made along the raised corrugations to lessen the risk of leakage. Holes can be punched during the erection of the roof; their positions should first be determined by placing the sheets in position and marking the necessary point of fixing. Sheets are usually attached to timber framework with galvanized screws, or nails with domed washers placed under their heads. Fixing to a steel framework is effected by means of galvanized hooked bolts clipping the purlins passed through the sheet and held tight by nuts.

FIG. 11.—Detail of Main Rib and Column, Olympia.

FIG. 12.—Cross-Section of Olympia from the Drawings of the architect, A. T. Walmisley, Esq.

FIG. 13.—Westminster Cathedral: section through nave.
Zinc in sheets is a material largely used as a roof covering, and if care be taken to ensure metal of good quality, it proves itself light, strong and durable, as well as inexpensive. Zinc is stronger weight for weight than lead, slate, tile and glass, but weaker than copper, wrought-iron and steel, although with the exception of the two last mentioned it is not so durable when exposed to the weather. It is not liable to easy breakage as are slate, tile and glass. It is usually supplied in flat sheets, although it can also be had in the corrugated form similar to corrugated sheet-iron. When exposed, a thin coating of oxide is formed on the surface which protects the metal beneath from further change, and obviates the necessity of painting. In laying the sheets, the use of solder and nails should be avoided entirely except for fixing clips and tacks which do not interfere with the free expansion and contraction of the sheets. The reason for this is that zinc expands freely, and sheets laid with soldered seams or fixed with nails are liable to buckle and probably break away owing to movements set up by changes of temperature. The usual sizes of zinc sheets are 7 ft. or 8 ft. long by 3 ft. wide. The thickness and weight of zinc are given in the following table, which compares the Vielle Montague Gauge with the Old Belgian Gauge and the British Imperial Standard Wire Gauge.

The best method of laying a zinc flat roof is with the aid of wood "rolls" of about 2 ft. x 2 in. section, splayed at sides and spaced 2 ft. 8 in. apart and fixed to the roof boarding with zinc nails. Iron nails should not be used as this metal affects the zinc. The sheets of zinc are laid between the rolls with their sides bent up 1 in. or 2 in., and held firmly in position by clips of zinc attached to the rolls. A cap of the same metal is then slipped over each roll and fastened down by tacks about 3 in. long soldered inside it so as to hook under the same clips that hold the sheet down. Drips of about 21 in. are made in the slope at intervals of 6 ft. or 7 ft.—that is, the length of a sheet—and special care must be taken at these points to keep the work waterproof. The lower sheet is bent up the face of the drip and under the projecting portion of the upper sheet, which is finished with a roll edge to turn off the water. The end of the roll has a specially folded cap which also finishes with a curved or beaded water check, and this in conjunction with the saddle piece of the roll beneath forms a weather-proof joint (figs. 17 and 18). The fall between the drips is usually made about 1 in.

and contraction, and the use of nails and solder avoided as far as possible. Contact with iron sets up corrosion in lead, and when nails are necessary they should be of copper; screws should be of brass. Lead is supplied in rolls of 25 to 35 ft. long and 6 ft. to 7 ft. wide. That in general use varies from one-fourteenth to one-seventh of an inch in thickness. The weights most suitable for employment in roofing work are 7 or 8 lb per square foot for flats and gutters, 6 lb per square foot for ridges and hips, and 3 lb for flashings.

As a roof covering copper is lighter, stronger and more durable than either zinc or lead. It expands and contracts much less than these metals, and although not so strong as wrought-iron, and steel it is much more durable. From a structural point of view these qualities enable it to be classed as the best available metal for roof covering, although its heat-conducting properties require it to be well insulated by layers of felt and other non-conducting material placed beneath the metal. On exposure to the air copper develops a feature of great beauty in the coating of green carbonate which forms upon its surface protecting it from further decomposition. Perhaps the chief disadvantage in the use of copper lies in its first cost, but against this must be set the almost imperishable nature of the metal and the fact that by reason of its weight less substantial framework is required for its support. Copper roofing should be laid in a similar manner to zinc, with wood rolls at intervals of about 2 ft. 4 in. It is, however, often laid with wellelmed seams. The general stock sizes of sheets are from 4 ft. to 5 ft. and 2 ft. to 3 ft. in width. The sheet-laid almost invariably used is known as 24 S.W.G. and weighs 16 oz. per square foot, Thinner metal would suffice, but owing to the increased cost of rolling very little would be gained by adopting the thinner gauge.

In the United States of America "tin" roofs are quite commonly used. Sheets of wrought-iron coated either with tin or zinc are used of a size usually 14 in. by 20 in. The coat is usually doubled this amount. Preparation for laying is by fixing an insulating foundation of somewhat stout paper or felt; this must be dry, else it is apt to spoil the impermeable covering laid upon it by causing it to rust. Junctions between the sheets are made by welted seams in which the four edges of the sheets are turned over to lock together, and a strip of canvas or one large sheet of tin covering the roof. In high-class work of a permanent nature the seams in addition are soldered, rosin only being used as a flux. Each sheet also is secured to the roof with two or three tin cleats. The life of such roofs may be practically doubled by the application of a good coat of paint, which, however, adds considerably to the cost.

Slate is a strong and very impermeable material, and these qualities and the fact that it is easily split into thin plates suitable for laying, as well as its low cost, cause it to be by far the most generally used of all materials for roof covering. Some of the best known varieties of slates, classed according to their colour, are as follows:

- Blue... North Wales (Penrhyn, Festiniog, Dinorwig, &c.)
- Blue-grey... Cornwall (Dorbelioe).
- Grey... North Wales (Penrhyn, Dinorwig).
Plates are cut to different sizes varying in length from 10 in. to 36 in. and in width from 5 in. to 24 in. There are perhaps thirty or more recognized sizes, each distinguished by a different name. In common practice those generally used are "ladies," 16 in. by 8 in.; "countesses," 20 in. by 10 in.; and "duchesses," 24 in. by 12 in. Generally speaking, the rule governing the use of the different sorts is that the steeper the pitch the smaller the slate, and vice versa. Buildings in very exposed positions naturally require steeply pitched roofs.

Some of the technical terms used by the slaters are as follows:—

Bed, the under surface of a slab when laid.

Buck, the upper surface of the slate.

Gauge, the distance between the lines of nailing. This depends on the length of the slate and equals half the length of the slate after the lap plus an inch for the nail-hole has been deducted. This is for slates nailed near the top edge; for those fixed near the middle the gauge would be half an inch more, as no allowance for nail-holes is required.

Margin, the width of the exposed portion of each course which equals the width apart of the nailing.

Head and tail, the top and bottom edges of the slate.

Lap, the lap of the tail of one course of slates over the head of the second course below it. The lap is made from 2 1/2 in. to 4 in. (usually 3 in.), and for this distance there are three thicknesses of slate, namely, the tail of the top course, the middle of the next and the head of the third course.

Slates may be fixed by nailing at the head (see fig. 22) or at about the middle. The latter method is the stronger, as the levering effect of the wind cannot attain so great a strength. There is a small economy effected by centre nailing, as the margin is slightly larger and more of the roof is given space; longer nails, however, are required, for as slates are laid at an angle with the pitch of the roof their centres cannot be made to approach so near to the slating battens or boarding as the head, which lies close on the surface to which it is fixed. Another point worth noticing is that the nail-holes in the centre nailed slate are only covered by 3 in. of the tail (the amount of the "lap") of the course of slates above, and rain is very liable to be forced under by the wind and cause the wood battens or other work to rot. Head-nailed slates, on the other hand, have their holes covered by two layers of slate, and are removed from exposure by the length of the gauge plus the lap, which in the case of "countess" slating equals 11 in.

"Open slating" is an economical method of laying slates that is often adopted for the roofs of sheds and temporary buildings. The slates in the same course are not laid edge to edge as in close slating, but at a distance of two or more inches apart. This forms a roof covering light in weight and inexpensive, which, although not strictly weather-proof, is sufficiently so for the buildings upon which it is used.

Slates are laid upon open battens fixed upon the rafters or upon close boarding or upon battens fixed upon boarding. The battens are 3 1/2 in. or 1 in. thick and 14 in. to 3 in. wide, and are spaced to suit the pitch of the slates. When close boarding is used it is often covered with inodorous asphalted felt. While taking these precautions to make the roof sound and tight it should be borne in mind that slate is liable to decay if not ventilated, and to effect this the battens are sometimes fixed vertically, ridge ventilators introduced and air inlets arranged at the eaves. The bed of slates

laid without provision for the admission of air will be found on removal after some time to have rotted so as to scale off and easily crumble into powder.

The nails used in slating are a very important item, and the durability of the work depends to a large extent upon them. They should have large flat heads. The most satisfactory are those made of a composition of copper and zinc, but other nails of copper, zinc, galvanized iron and plain iron are used. Those of copper are most suitable for soft and expensive. Zinc nails are soft and not very durable; they will last about twenty years. Iron nails even if galvanized are objectionable in permanent work, though they may be used for temporary roofs. When the plain-iron nails are laid they should be driven and plunged in boiled linseed oil. The pitch of a roof intended for slating should not incline less than 25° with the horizontal, while 30° is a safer angle to adopt.

Tiles for roofing purposes are made from clay and burned in a manner similar to bricks. The clay from which they are made, however, is of a special kind and prepared with great care so as to obtain a result as strong and nearly non-porous as possible. Tiles are obtainable in many different colours, and some of these have a very beautiful effect when fixed and improve with age. They comprise a large number of tiles from yellowish red, red and brown to dark blue. As with bricks the quality depends largely upon the burning; underburnt tiles are weak and porous, liable to early decay, while overburning, though improving the tiles as regards durability, will cause them to warp and will spoil colour. The usual shape is the "plain tile," but they are made in various other shapes with a view both to easier fixing and lighter weight, and to ornamental effect. There are also "lecked" tiles, formed for the market for which the making of special advantages. The ordinary tiles are slightly curved in shape to enable them to lie close upon one another. Some of them have small "nibs" moulded on the head by which they may be hung up on battens and nailing avoided (see fig. 23). Nail-holes are provided, and upon steep slopes it is advisable to make use of them. Others are made without the nubs, and are fixed either by nailing to the battens or boarding or by gluing over by means of oaken pegs wedged in the holes to the battens, the pegs in the latter case acting in the same way as the above-mentioned nubs. Plain tiles are of rectangular form, and standard dimensions are 10 by 6 1/2 in. Weight is usually 3 lb. thick and weigh about 24 lb. each.

There are many forms of ornamental tiles, which are plain tiles having their tails cut to various shapes instead of moulded square, and patented forms of some old ones which possess considerable merit. Pantiles are suitable for temporary and inferior buildings such as sheds and outhouses. They are laid on a different principle from plain tiles, merely overlapping each other at the edges, and this necessitates bedding in mortar and setting inside and sometimes outside with mortar or cement. This pointings plays an important part in keeping the interior of the building free from the penetration of wind and water. Pantiles are generally made to measure 13 by 9 in. by 3 lb. in weight, and are spaced 3 in. above each other to 5 1/2 in. Each pointing at the head of each tile is a small projecting nib which serves for the purpose of hanging the tile to the rafters or battens. They are laid with a lap of 3 1/2 in., 21 in., or 1 1/2 in., giving a gauge (and margin) of 10 in., 11 in. and 12 in. respectively. The width of the pantile is generally 1 1/2 in., having a length of 8 in. exposed face. There are many other forms based upon the shape of the pantile, some of which are patented and claimed to have advantages which the original form does not possess. Among such are "Maidenhair," "Copper," "Tig," "Lion's Mane," namely, which have also been patented, and "Twisted Pantile," "Quill Pantile," "Alpine Roof." The pantile is the most common pattern, made in many sizes and shapes, and in many materials including terracotta, brick and marble.

Glass is a roof covering and the different methods of fixing it are dealt with in the article GLAZING.

There are many other materials used for roof covering besides those already described, many of them of considerable value. Some have been used in the past but are no longer practical due to the development and cheapening of other forms of roofing. Among these may be included thatch and wood shingles, the use of which in these days is practically reduced to special cases. Other, little used roofing materials are those of recent invention, some of which
have a great future before them. Plates of asbestos used as slates or tiles make a light, strong and fireproof covering. Large terracotta tiles or slabs are much used in the United States of America. A good form of flat roof is that in which concrete is used as a foundation for a layer of broken material, laid to eight inches thick to allow the water to run off easily. This is the usual method adopted when a roof garden is required. Shingles or thatch look extremely well on a roof, but their use is debased in many great districts owing to the danger of fire. Galvanized iron tiles, zinc and copper tiles may be employed on small areas with good effect. "Welded paper," often used as an insulating layer beneath slates and tiles, is also at times used as a roof covering. It is cardboard chemically treated to render it tough, waterproof and fire-resisting.

The weights of the materials used in the construction and covering of roofs are given in the following table. The weights which are approximate are for a square foot of roofing. The roof trusses are taken to be spaced 10 ft and include the necessary purlins.

Wind pressure is usually calculated at 22 to 25 lb on a roof with pitch of 45°, and 27 to 30 lb on a roof of 45° pitch.

From these particulars it is easy to calculate the weight of a square (100 superficial ft.) of roofing material, this being the usual standard of measurement for many roofing materials.

The London Building Act of 1864 and its amendments set forth with regard to flat roofs the "boundary distance," a structure on a roof to be covered with slate, tile, metal or other incombustible material, except wooden cornices and barge boards to dormers not exceeding 12 in. in depth, and doors and windows and their frames. Every dwelling house or factory above 30 ft. in height and having a parapet must have means of access to the roof. The pitch of the roofs of warehouse buildings must not exceed 45°, and those of other buildings must not exceed 30°, but towers, turrets and spires are exceptions. In domestic buildings not more than two storeys are to be formed in the roof, and if the floor is more than 60 ft. above the street level fireproof materials must be used throughout and a sufficient means of egress. All building materials of wood, except the clothing of buildings, which the applying Johannesburg contain several clauses affecting the designing of roofs and their method of construction. In the designing of buildings roof-slopes must be within a line drawn and produced from the ground level at the opposite side of the street to the top of the eaves, gutter or parapet. No roof in the municipal fire limit may be constructed of thatch, reed or other inflammable material. Without the fire area they may be so constructed if the building stands at least 20 ft. from the boundary of its site. Roof's having a pitch of less than 22° must be constructed to bear simply a load of at least 28 lb per square foot of surface. Roofs of steeper pitch must be able to support a load of 21 lb per square foot. The framing of Mansard or other roofs of more than 60° pitch on a building exceeding 50 ft. in height must not be of wood, but of approved fireproof material at least 2 in. thick. No roofs except those of towers, turrets or spires shall exceed 70° pitch for a Mansard or 60° for an ordinary roof. Every fireproof roof, in addition to a door or scutcheons must have, if it is to be used as a watch-room, a skyline of metal framing, having an area equal to at least one-sixth the area of the roof. Skylights placed over rooms or areas to which the public have access must be protected by wire netting below or by glass or wire glass.

The Building and Health Laws and Regulations and Amendments of 1905 affecting the city of New York are based, so far as the construction of roofs goes, upon the same lines as those of London, the principal difference being with regard to the height details, under part 24, as to the heights of materials required to be used and the wind pressure to be provided against. In part 19 they provide that where a building exceeds three storeys or 40 ft. in height and the roof has a pitch of over 60°, it shall be constructed of iron rafters and be lathed with iron or steel on the inside and plastered or be filled in with fireproof material not less than 3 in. thick and covered with metal, slate or tile. The provision as to access to roof and fire escapes therefrom adopted by the London County Council in 1907 under the London Building Act Amendment Act 1905 were in operation in New York in 1899.

LITERATURE.—The principal reference books on this subject are the following:—Thomas Trelgold, Elementary Principles of Architecture, Newland, Carpenter and Joiner's Assistant; G. Sutcliffe, The Modern Carpenter, Joiner and Cabinet Maker; J. Griffiths, Trusses in Wood and Iron; F. Bond, Gothic Architecture; J. Gwilt, Encyclopaedia of Architecture; F. E. Kidder, Trussed Roofs, Etc.; R. B. Britain and A. Pugin, Ornamental Gables; M. Emly, L'Art de la charpenterie; Viollet le Duc, Dictionnaire; J. K. Colling, Details of Gothic Architecture.

ROOK (O. E. Hrōc, Icel. Hrðkr, Swed. Råka, Du. Rock, Gael. Rosca), the Corvus frugilegus of ornithology, and throughout a great part of Europe the commonest and best-known of the crow tribe, belonging to the passerine family Corvidae. Besides its pre-eminently gregarious habits, which did not escape the notice of Virgil (Georg. i. 383) and are so unlike those of nearly every other member of the Corvidae, the rook is at once distinguished from the rest by commonly losing at an early age the feathers from its face, leaving a bare, scabrous and greyish-white skin that is sufficiently visible at some distance.

In the comparatively rainy seasons, in which these feathers persist, the rook may be readily known from the black form of crow (q.v.) by the rich purple gloss of its black plumage, especially on the head and neck, the feathers of which are so soft and not pointed. In a general way the appearance and manners of the rook are well known, and particularly its habit of forming communities in the breeding-season, which it possesses in a measure to carry beyond that of any other land bird of the northern hemisphere. Yet each of these communities, or rookeries, seems to have some custom intrinsically its own. In a general way the least-known parts of the rook's mode of life are facts relating to its migration and geographical distribution. Though the great majority of rooks in Britain are sedentary or only change their abode to a very limited extent, it is now certain that a very considerable number arrive in or towards autumn, and necessarily to abide, but merely to pass onward, like most other kinds of birds, to winter farther southwards; and, at the same season or a little earlier, it cannot be doubted that a large proportion of the young of the year migrate in the same direction. As a species the rook on the European continent only resides during the whole year throughout the middle tract of its ordinary range. Further to the northward, as in Sweden and northern Russia, it is a regular summer-immigrant, while farther to the southward, as in southern France, Spain and most parts of Italy, it is, on the contrary, a regular winter-immigrant. The same is found to be the case in Asia, where it extends eastward as far as the upper Irrish and the Ob. It breeds throughout Turkestan, in the cold weather visiting Afghanistan, Cashmere and the Punjab, and Sir Oliver St John found a rookery of considerable size at Caibin in Persia. In Palestine and in lower Egypt it is only a winter-visitor, and II. B. Tristram noticed that hearing such great numbers about the mosque of Omar in Jerusalem. The same writer (Proc. Zool. Soc. 1864, 444; Ibis, 1866, pp. 68, 69) considered the Palestine rook entitled to specific distinction as Corvus Agricola. The rook of China has also been described as a distinct species, C. pastorinar (Proc. Zool. Soc., 1845, p. 1) from having the feathers of its face only partially deciduous.

ROOKE, SIR GEORGE (1650–1709), English naval commander, was born near Canterbury in 1650. Entering the navy as a volunteer, he served in the Dutch Wars and became post-captain in 1673. After the Revolution of 1688, he commanded

1 The bird, however, does not inhabit Iceland, and the language to which the name belongs would perhaps be more correctly termed Old Teutonic. From this word is said to come the French Fœux. There are many local German names of the same origin, such as Röoko, Rouck, Rouch, and others, but the bird is generally known in Germany as the Stadtkräh, i.e. (city-)-crow.

2 This is the more noteworthy as the district in which he was born and educated is almost the only part of Italy in which the rook breeds. Shelley also very truly speaks of the "legioned rooks" to which he stood listening "mid the mountains Euganean."
ROOM—ROORKEE

the squadron which raised the siege of Londonderry in 1869. He became rear-admiral in 1869, and fought at the battle of Beaufort Sound. In May of 1862 he served under Russell at the battle of Birleir, and he greatly distinguished himself in a night attack on the French fleet at La Hogue, when he succeeded in burning six of their ships. Shortly afterwards he received the honour of knighthood and a reward of £1000. In 1863 he commanded the Smyrna convoy, which was scattered and partly taken by the French admiral Tourville near Lagos Bay. Till the peace of Nymwegen (1697), he continued to serve in the Channel and Mediterranean. In 1702 he commanded the expedition against Cadiz, and on the passage home destroyed the Plate fleet in Vigo. With Sir Cloudesley Shovel he took part in the capture of Gibraltar on the 21st of July 1704. On the 13th of August of the same year he attacked the French fleet off Malaga, the battle being drawn. On account of the dissatisfaction expressed indirectly at the result of the contest, he retired from the service in February 1705. He died on the 24th of January 1706.

Rooske’s Journal for 1700–2 has been printed by the Navy Record Society.

ROOM, originally a word meaning space or accommodation; the ordinary meaning of an apartment in a building, one of the interior divisions of a house, dates from the 15th century. The word is common to Teutonic languages, cf. Du. raum, Ger. Raum, Swe. and Dan. rum, with the original meaning of space. Skeat connects the word with the root seen in Lat. rīs, open country.

ROOKE, ALBRECHT THEODOR EMIL, COUNT VON (1803–1879), Prussian general field-marshal, was born at Pleuszagen, near Colberg, in Pomerania, on the 30th of April 1803. His family was of Flemish origin, and was settled in Pomerania. His father, an officer of the Prussian army, died in poverty during the French occupation, and young von Roon was brought up, in a country ravaged in the War of the Second Coalition and wrecked financially by his maternal grandmother. He entered the corps of cadets at Kulm in 1816, whence in 1818 he proceeded to the military school at Berlin, and in January 1821 received a commission in the 14th (3rd Pomeranian) regiment quartered at Stargard in Pomerania. In 1824 he went through the three years’ higher course of study at the war school in Berlin, where he also applied himself with the greatest energy to improving his general education. In 1826 he was transferred to the 15th regiment at Minden, but in the same year was appointed an instructor in the military cadet school at Berlin, where he devoted himself especially to the subject of military geography. He published in 1832 the well-known Principles of Physical, National and Political Geography, in three volumes (Grundsätze der Erd-, Völker- und Staaten-Kunde), which gained him a great reputation, and of which over 40,000 copies were sold in a few years. This work was followed in 1834 by Elements of Geography (Anweisung grunde der Erdkunde), in 1837 by Military Geography of Europe (Militärische Länderbeschreibung von Europa), and in 1839 by The Iberian Peninsula (Die Iberische Halbinsel).

Meantime, in 1832, he rejoined his regiment, and was afterwards attached to the headquarters of General von Müffling’s corps of observation at Crefeld, where he first became alive to the very inefficient state of the Prussian army. In 1833 he was appointed to the Topographical Bureau at Berlin, in 1835 he entered the General Staff, and in the following year was promoted captain and became instructor and examiner in the military academy at Berlin. In 1842, after an illness of two years brought on by overwork, he was promoted to major and attached to the staff of the VII. corps, in which post he was again impressed with the inefficiency of the organization of the army, and occupied himself with schemes for its reform. Two years later, as tutor to Prince Frederick Charles, he attended him to Bonn university and in his European travels. In 1848 he was appointed chief of the staff of the VIII. Army Corps at Coblenz. During the disturbances of that year he served under the Crown Prince William (afterwards German emperor) in the suppression of the insurrection at Baden, and distinguished himself by his energy and bravery, receiving the 3rd class of the order of the Red Eagle in recognition of his services. While attached to the Crown Prince’s staff at that time he broached to him the subject of his schemes of army reform. In 1850 came the revelation of defective organization and efficiency which led to the humiliating treaty of Olmütz. In the same year Roon was made a lieutenant-colonel, and in 1851 full colonel. He now enjoyed the confidence of Prince William, and began active work as reorganizer of the army.

Promoted to be major-general in 1856 and lieutenant-general in 1859, Roon had held since 1850 several commands and had been employed on important missions. Prince William became regent in 1857, and in 1859 he appointed Roon a member of a commission to report on the reorganization of the army. Supported by Manteuffel and Molte, Roon was able to get his plans seriously considered and generally adopted. His aim was to create an armed nation, to extend Scharnhorst’s system and to adapt it to Prussia’s altered circumstances. To attain this he proposed a universal three years’ service, and a reserve (Landwehr) for the defence of the country when the army was actively engaged. During the Italian War he was charged with the mobilization of a division. At the end of 1859, though the junior lieutenant-general in the army, he succeeded von Bonin as war minister, and two years later the ministry of marine was also entrusted to him. His proposals of army reorganization met with the bitterest opposition, and it was not until after long fighting against a hostile majority in the chambers that, with Bismarck’s aid, he carried the day. Even the Danish campaign of 1864 did not wholly convince the country of the necessity of his measures, and it required the war with Austria of 1866 to convert obstinate opposition into enthusiastic support. After that von Roon, from being the best-hated man in Prussia, became the most popular, and his reforms were ultimately copied throughout continental Europe. He was promoted to field-marshal after this war, was present at the brilliant and decisive victory of Königgrätz, and received the Black Eagle at Nikolsburg on the road to Vienna. His system, adopted after 1866 by the whole North German Confederation, produced its inevitable result in the victorious war with France 1870–71, throughout which von Roon was in attendance on the German emperor. The fiftieth anniversary of his entrance into the army was celebrated at Versailles on the 19th of January 1871, when the emperor expressed his gratitude for the great services he had rendered. He was created a count, and in December 1871, having resigned the ministries of war and marine, he succeeded Bismarck as president of the Prussian ministry Ill-health compelled him to resign in the following year. He was promoted to be field-marshal on the 1st of January 1873. He died at Berlin on the 23rd of February 1879.

After his death his son published the valuable Denkwürdigkeiten aus dem Leben des Generalfeldmarschalls Kriegsministers Grafen Roon (2 vols., Breslau, 1892), and Kriegsminister von Roon als Redner politisch und militärisch erläutert (Breslau, 1893). His correspondence with his friend Professor C. P. Perthes, 1864–67, was also published at Breslau in 1890.

ROORKEE, or ROORKI, a town of British India, in the Saharanpur district of the United Provinces, on the Oudh & Rohilkhand railway, 22 m. E. of Saharanpur. Pop. (1901) 17,107. It is the headquarters of the workshops of the Ganges canal, and also of the Bengal Sappers and Miners. Two heavy batteries of artillery are usually stationed in the cantonment. The Thomason Civil Engineering College, founded in 1848, was transferred from the Public Works to the Education Department in 1895 and reorganized. It was instituted in order to train natives in engineering, and students originally received stipends. After 1875 the emoluments were limited, and became the nature of scholarships, but the education of all students remained practically the same till 1890, when fees began to be charged. The college works in co-operation with the workshops and foundry of the canal, and also trains in surveying, photography and other subjects, having chemical, physical, electrical and mechanical laboratories and workshops.
ROOSEVELT

ROOSEVELT, THEODORE (1858-1919), twenty-sixth president of the United States, was born in New York City on the 27th of October 1858. The Roosevelt family has been prominent in the life of New York for many generations, and is of Dutch origin. Mr. Roosevelt's mother, Martha Bullock, came from a family of Scotch-Irish and Huguenot origin equally prominent in Georgia. Each family may lay just claims to a history of more than ordinary social and political distinction. Although born in New York, Mr. Roosevelt spent much of his boyhood at Oyster Bay, the country home of his father, on Long Island Sound, where he began with a distinct purpose, unusual among boys of his age, to build up a naturally frail physique by rowing and swimming in the waters of Long Island Sound, and by riding over the hills and tramping through the woods of Long Island. That his early outdoor life furnished a definite training for his later career is indicated by the fact that when he was about fourteen years of age he went with his father on a tour up the Nile as far as Luxor, and on this journey he made a collection of Egyptian birds found in the Nile valley, which is now in the Smithsonian Museum in Washington, D.C. (2). Mr. Roosevelt entered Harvard University, where he graduated in the class of 1880; his record for scholarship was creditable, and his interest in athletics and sportsmanship was a remarkable character in his skill as a boxer. On leaving college he made a short visit to Europe, was elected to the London Alpine Club for climbing the Jungfrau and the Matterhorn, and returning to New York studied law for a brief period in the Law School of Columbia University and in the office of his uncle Robert B. Roosevelt. Determining to enter active politics, he gave up his legal studies without qualifying for the bar, and in 1881 he was elected to the New York legislature as a regular Republican, although in opposition to the "boss" of the assembly district for which he was a candidate. He was elected again in 1882 and in 1883, and at the age of twenty-four was his party's candidate for Speaker of the Assembly. In 1884 he was a delegate of the Republican party to the convention in Chicago which nominated James G. Blaine for president. In the convention he opposed the nomination of Mr. Blaine, and in a speech which attracted considerable attention for its vigour and courage advocated the nomination of Senator George F. Edmunds. After Mr. Blaine's nomination, however, he supported him in the campaign as the chosen candidate of the party, in spite of the fact that an important wing of the Republican party "bolted" the nomination and espoused the candidacy of Grover Cleveland, who was elected president. In 1884, partly because his political life seemed at least for the immediate present to be at an end, partly on account of the freedom and activity of out-of-door life, he bought two cattle ranches near Medora on the Little Missouri river in North Dakota, where he lived for two years, becoming intimately associated with the life and spirit of the western portion of the United States.

In 1886 he was the Republican candidate for mayor of New York City, but was defeated by Abram F. Hewitt, the Tammany candidate, and received a smaller vote than Henry George, the candidate of the United Labor party. Mr. Roosevelt, however, received a larger proportion of the total vote cast than any mayorly candidate of the Republican party had previously received in New York City. In April 1886, on the accession to the presidency of Benjamin Harrison, Mr. Roosevelt, then closely identified with the work of Civil Service reform, was appointed a member of the United States Civil Service Commission. In this office, until then one of minor importance, he served for six years. He made it not only nationally prominent, but instrumental in shaping the course of legislative and executive action by introducing into the work of the Commission an entirely new spirit and new methods. The annual reports, of which he was the chief author, became controversial pamphlets; he published bold replies to criticisms upon the work of the Commission; he explained its purposes to newspaper correspondents; when Congress refused to appropriate the amount which he believed essential for the work, he made the necessary economies by abandoning examinations of candidates for the Civil Service in those districts whose representatives in Congress had voted to reduce the appropriation, thus very shrewdly bringing their adverse vote into disfavour among their own constituents; and during the six years his commissionmanship was more than twenty thousand positions for government employees were taken out of the realm of merely political appointment and added to the classified service to be obtained and retained for merit only. In 1893 he resigned from the Civil Service Commission and became President of the Board of Police Commissioners for the City of New York. After a strenuous two years in this office, he was appointed by President McKinley in 1897 assistant-secretary of the navy. He was certain that war with Spain was inevitable, and he did much to prepare the navy for hostilities, framing an important personnel bill, collecting ammunition, getting large supplies of powder and ammunition used in improving the marksmanship of the navy by gunnery practice, buying transports and securing the distribution of ships and supplies (especially in the Pacific) in such a way that, when hostilities were declared, American naval victories would be assured. He urged upon the administration the bold policy of protecting the sacking of Cervera's fleet, on the ground that it would be regarded as a workable test of the policy of the Cuban revolutionaries who had no navy, but against the United States; and he advised that, if Cervera sailed, an American squadron be sent to meet him and to prevent his approach to America. At the outbreak of the war with Spain he resigned from the Navy Department and raised the first volunteer regiment of cavalry, popularly known as the "Rough Riders," because many of its members were Western cowboys and ranchmen expert in the handling of the rough and often unbroken horses of the Western frontier. The regiment also included college athletes, city clubmen and members of the New York police force, every man possessing some special qualification for the work in view. Mr. Roosevelt declined the colonelcy of the regiment, preferring to take the post of lieutenant-colonel under his intimate friend Dr. Leonard Wood, who, while a surgeon in the United States army, served...
ROOSEVELT

in action with gallantry and skill against the Indians. On the promotion of Colonel Wood to the command of the brigade, Mr Roosevelt became colonel of the regiment, which took an especially prominent part in the storming of San Juan Hill. In this battle Colonel Roosevelt became the ranking officer and, abandoning his horse, led the charge up the hill on foot under severe fire at the head of his troops. This charge, in which many of the "Rough Riders" were killed or wounded, drove the Spaniards from the trenches and opened the way to the surrender of Santiago. At the conclusion of the war, while the troops were still in camp in the South, Mr Roosevelt joined in a "round robin" of protest against the mismanagement in the War Department, which had resulted in widespread suffering among the troops from wretched food and bad sanitary arrangements. This "round robin" created a sensation which aroused public opinion and was instrumental in bringing about some desirable reforms in the War Department.

When his regiment was mustered out of service in September 1898, Mr Roosevelt was nominated by the Republican party for the governorship of New York State and was elected in November by a substantial plurality. He was governor for two years. He reformed the administration of the state canals, making the Canal Commission non-partisan; he introduced the merit system into many of the subordinate offices of the state; and he vigorously urged the passage of and signed the Ford Franchise Act (1899), taxation corporation franchises. In various contests, in which he was almost uniformly victorious, he showed himself to be independent of "boss" control. In 1900, although he wished to serve another term as governor in order to complete and establish certain policies within the state, he was nominated for the vice-presidency of the United States on the ticket with President McKinley by the Republican National Convention in Philadelphia in spite of his protest. It was very commonly believed at the time that this nomination for the vice-presidency was participated and heartily approved of by the machine politicians or "bosses" of the State of New York in their belief that it would result in his elimination from active political life. The office of vice-president of the United States had so far in the history of the country been almost purely a perfunctory one, and has rarely, if ever, led to political promotion. The vice-president is ex officio president of the Senate, but has little voice or part in shaping either legislation or the affairs of the party. Mr Roosevelt never, however, presided over the deliberations of the Senate, before the session following his inauguration convened he had ceased to be vice-president.

Upon the assassination of McKinley, on the 14th of September 1901, he succeeded to the presidency. No previous president had entered the office at so early an age as forty-three. It was his frankly expressed wish to be nominated and elected president. He was nominated unanimously by the Republican National Convention at Chicago, and was elected in November of that year by the largest popular majority ever given to any candidate in any presidential election. He received 7,623,486 popular votes and 336 electoral votes to 5,077,971 popular votes and 140 electoral votes cast for Judge Alton B. Parker, the nominee of the Democratic party. Immediately after his election he publicly declared that he would not accept the nomination for the presidency in 1904, and he adhered to that pledge in spite of great popular pressure brought to bear upon him to accept the nomination of the party for another term. The nomination and election of President Taft, who had been a member of Mr Roosevelt's cabinet, was very largely due to the latter's great influence in the party. On March 23rd, two weeks after he ceased to be president, Mr Roosevelt sailed for Africa, to carry out a long-cherished plan of conducting an expedition for the purpose of making a scientific collection of the fauna and flora of the tropical regions of that continent. Expert naturalists accompanied the party, which did not emerge from the wilderness until the middle of the following March, bringing with it a collection which scientists pronounce of unusual value for students of natural history. Most of the specimens were sent to the National Museum of the Smithsonian Institution at Washington. The experiences of his African journey were recorded by Mr Roosevelt in a volume entitled African Game Trails: The Wanderings of an American Hunter Naturalist. The spring and early summer of 1910 were spent by Mr Roosevelt in travelling through Egypt, the continent of Europe, and England, in acceptance of invitations which he had received to make various public speeches in these countries. Honorary academic degrees were conferred upon him by the universities of Cairo, Christiania, Berlin, Cambridge and Oxford, and he was given both popular and official ovations of almost royal distinction—ovations which were repeated by his own countrymen on his return to America.

It may be said without exaggeration that no American public man in the history of the country has achieved such extraordinary popularity during his lifetime as Mr Roosevelt, who attained at fifty-three years of age, both as a politician and as a soldier. Great popularity necessarily brings with it bitter enmity and genuine criticism. To understand clearly his career as a public man, and to appreciate the forces at work which caused both the popularity and the enmity, two facts must be kept distinctly in mind: first, that at twenty-two years of age he deliberately decided to make politics his life-work at a time when in the United States the word "politics" had a sinister sound in the ears of almost all of the so-called cultivated classes; and secondly, that in making this deliberate choice he recognized that the government of the United States is primarily a party government. He therefore allied himself with the Republican party, to which by tradition, by family association, and by political principles he was naturally drawn.

In the history of the United States the politician has been too often the man who, in connexion with some other trade or profession, has taken up politics as a tool to serve out some personal ambition or manufacture a financial profit. Mr Roosevelt from the beginning apparently believed with the lexicographers that politics is the science and practice of government. He has himself told the story of an early experience that illustrates his point of view. When in 1881 he decided to join the Republican Association of his assembly district in New York City, members of his family were shocked.

"You will find at the meetings," they said, "nobody but grooms, liquor dealers and low politicians." "Well," said Mr Roosevelt in reply, "if that is so, they belong to the governing class, and you do not. I mean if I can to be one of the governing class." He forthwith became an active member of the political organization of his district. He also early determined to work with his party as being the only way in which a legislator can work. A free lance, an independent, a journalist, or a preacher, without definite political affiliations, may create his own opinion but a legislator or an administrator must belong to a party. Mr Roosevelt was severely criticized by many "independent Republicans" for having supported the presidential candidacy of James G. Blaine in 1884, when he had vigorously opposed his nomination in the convention on moral grounds. The reply to this criticism is that Mr Blaine was the choice of the majority of the party, and that while Mr Roosevelt felt free to fight within the party vigorously for reform, he did not feel that the nomination justified a schism like that which occurred in the Democratic party over the free silver issue in 1896—a schism which remained afterwards a hopeless weakness in that party. His position in the Blaine campaign his attitude in tariff discussions and legislation, his relations with United States senators, congressional representatives, and other party leaders, his methods in making official appointments, were entirely consistent with his constantly reiterated conviction that in politics personal good must be achieved not by guerilla warfare, but by working through and within the party. He was so often accused by political purists for associating politically with men of discredited reputation that his own picturesque statement of his conversion to a belief that in legislative or administrative politics
one must work with all sorts and conditions of men is illuminating. This statement is related by his intimate friend Jacob A. Riis, to whom Mr Roosevelt made it in commenting upon his first political success in the New York legislature. "I suppose that my head was swelled. It would not be strange if it was. I stood out for my own opinion alone. I took the best 'mugwump' stand—my own conscience, my own judgment to decide in all things. I would listen to no argument, no advice. I would be isolated on every issue, and no arguments left me. When I looked around, before the session was well under way, I found myself alone. I was absolutely deserted. The people didn't understand. The men from Erie, from Suffolk, from anywhere, would not work with me. He wouldn't listen to any of them, or let them in at all; he was isolated, and they said, and I would not. My isolated peak had become a valley; every bit of influence I had was gone. The things I wanted to do I was powerless to accomplish. I looked around and, and discovered that there were three great centers of opposition: there, with honest opinions of the right, even though they differed from me. I turned in to help them, and they turned to and gave a hand. And so we were able to get things done. We did not agree; we did not pull us, and we did in some, and those we pulled at together. That was my first lesson in real politics. It is just this: if you are cast on a desert island with only a screw-driver, a hatchet and a chisel to make a boat with, why, go make the best one you can. It would be right to do this. The better you have done, the better you do not have in view. Here is my example in Congress who is a good man, a strong man, but cannot be made to believe in any things in which I trust. It is too bad that he doesn't look at it as I do, but he does not, and we have tried him as we have tried others. That is the legal course; where a man must have the isolated peak and break with all his associates for clear principle: but until that time comes he must work, if he would be of use, with men as they are. As long as the good in them overbalances the evil, let him work with them for the better guided.

In his successive offices Mr Roosevelt not merely exerted a strong influence upon the immediate community, whose official representative he was at the time being, but by reason both of his forceful personality and of the often unconventional, although always effective, methods of work which he employed he achieved a national prominence out of ordinary proportion to the importance of his official position. His record in the Assembly was such that his party nominated him for the majority of the city of New York when he was absent on his ranch in Dakota. Although defeated in the majority election, his work on behalf of the merit system, as opposed to the spoils system of politics, was such that he was made a Civil Service commissioner—probably the last office a politician would wish to hold who desired further promotion, for the conflict which a Civil Service commissioner must have with members of Congress and the administration in堵 up his knowledge in his office, at any rate, has been in the past history of American politics, inevitably detrimental to further official advancement. He was taken from the Federal service in Washington to New York City by a reform mayor and put in charge of the police, because he had shown both physical and moral courage in fighting corruption of all sorts; and the New York police force at that time was thoroughly tainted with corruption, not in its rank and file, but among its superior officers, who used the power in their hands to extort money bribes chiefly from saloon-keepers, liquor-dealers, gamblers and prostitutes. As police commissioner Mr Roosevelt brought to his side every honest man on the force. By personal detective work, that is, by visiting police stations at unexpected times and by making the rounds at night of disorderly places which were suspected of violating the law, he not only displayed personal courage in positions of some he better if you had a saw, but you have a very saw; created by the novelty of his methods set standards and started reforms which have greatly improved the morale of the entire force. The hopelessly vicious policemen hated him, but no man ever had a stronger personal hold upon the great body of the honest officers—a hold which existed long after he left the police department, and was frequently expressed by members of the force as he passed through the city streets. When he became assistant-secretary of the navy, his work was not so publicly conspicuous, but in this office he gained an experience which was of great value in his administration of naval affairs during his presidency. It is doubtful if, without the experience of this secretariaship, he could have successfully originated and carried out the plan of sending the United States navy around the world in 1907. He went to the Spanish War as a volunteer against the urgent wishes of his political advisers, and in spite of the protests of some of his best and most intimate friends. The conditions in Cuba had long convinced him that war with Spain was inevitable, and that, for humane reasons alone, it was both right and necessary to drive the Spanish power out from the Caribbean Sea. Having urged this view upon the country, when war was declared he felt that it would be inconsistent for him not to share personally in the perils of a conflict which he believed to be a just one, and which he had done as much as he could to bring about. His record in the war for efficiency and personal gallantry no doubt contributed largely to his nomination and election as governor of the state of New York; but he attained the governorship not on this ground alone. There are many instances in American politics of nominations made solely on a war record which have led to hopeless defeat in election. His work in the governorship brought him still more into prominence as a national leader. His uncompromising antagonism to political blackmail and bribery, and his determination to pursue the right, as he saw the right, only in a common-sense fashion, made bitter enemies on the one hand among the corrupt politicians, and, on the other hand, among theoretical reformers, and discussions raged in the newspapers about his executive acts, his speeches, and his official messages much as they raged during his seven years in the White House. If he had never reached the presidency he would probably have been a figure long remembered in American political life. But it was his course in the presidency that gave him his international reputation, and it is as President Roosevelt that future historians of American political life will write of him.

Mr Roosevelt entered the presidency definitely committed to two principles which profoundly affected his course as chief executive of the United States. He had a well wrought-out belief in centralized authority in government and a passionate hatred of political and commercial corruption. He believed the United States to be a unified republic, a sovereign nation, and not a federation of independent states united only for mutual benefit and protection. He not only hated corruption per se, but he clearly saw that as efficiency has a greater power for good, so corruption has a greater power for evil in a strongly centralized government. He understood that political materialism, selfishness and corruption in federal administration afford the strongest possible argument for those who advocate strengthening the independent power of the separate states at the expense of nationalism. At the very outset of his administration he therefore set himself to work, not only to improve the personnel of the government service, but by exhortations in his messages and public speeches to arouse a sense of civic responsibility both among office-holders and among all the citizens. His official messages to Congress, probably more frequent, certainly much longer than those of any of his predecessors, were quite as often treatises on the moral principles of government as they were recommendations of specific legislative or administrative policies. The effect of his exhortations, as well as of his personal character and public acts, upon the standards and spirit of official life in the United States, was a pronounced one in attracting to the federal service a group of men who took up the work of public office with the same spirit of enthusiasm and self-sacrifice that actuates the military volunteer in time of war. No American president has done so much to discredit and destroy the old Jacksonian theory of party government that "to the victors belong the spoils," and to give the party in power a chance to make good faith and moral quality in the practical success which will advance the desirability of a system of appointments to office which rests upon efficiency and merit only. Mr Roosevelt not only attacked dishonesty in public affairs but in private business as well, asserting that "malefactors of great wealth" endeavoured to...
control legislation so as to increase the profits of monopolies or "trusts," and that to prevent such control it is necessary to extend the powers of the federal government. In carrying out this policy of government regulation and supervision of corporations he became involved in a great struggle with the powerful financial interests whose profits were threatened, and with those legislators who sincerely believed that government should solely concern itself with protecting life and property, and should leave questions of individual and social relations in trade and finance to be settled by the operation of so-called natural economic laws. In the struggle, although he was bitterly accused of violating the written constitution, of arresting and destroying business prosperity and of attempting a radical departure from the accepted social system of the country, he was remarkably successful. By his speeches and messages, and by his frank use of one of the greatest of modern social engines— the newspaper— he created a public opinion which heartily supported him. Under his effective influence laws were framed which were not merely in themselves measures of stringent regulation of business and the accumulation of wealth, but which established precedents, that as time goes on will inevitably make the doctrine of federal control permanent and of wider application. The struggle against one of the most powerful political influences of the time not unnaturally gave rise to the idea that his work as president was destructive— perhaps the necessarily destructive work of the reformer but not essentially constructive. Even those friendly to him sometimes felt it necessary to defend his political course by saying that he was compelled to raise the old buildings and prepare the ground on which his successors might build new and better structures. A brief consideration of some of the constructive achievements of his administration will show that the "destructive" theory of his political activities is not sustained by the facts. 

Civil Service Reform.—Some reference has already been made to the fact that in every office which Mr Roosevelt held he constantly dwelt upon the truism, often forgotten or ignored, that no government can accomplish any permanent good unless its administrative and legislative officers are chosen and maintained for merit only. As assemblyman, as police commissioner, as naval secretary and as president, he advocated this fundamental doctrine. When Federal Civil Service commissioner he did more than any other single public man in the United States has had either the ability or the opportunity to transform the fundamental and natural framework of the realm of theory into the realm of governmental practice. While he was criticized by the friends of Civil Service Reform for not going far enough during his presidency to protect the encouragement of natural resources—a development which involves the setting up of new officers for political purposes in the campaign of 1908 are typical of his vigorous support of the merit system.

Conservation of National Resources.—If Mr Roosevelt did not invent the idea of the conservation of public natural resources— a development which made Conservation in 1910 the foremost political and social question in the United States. The old theory was that the general prosperity of the country depends upon the development of its natural resources—a development which involves the setting up of new officers for political purposes in the campaign of 1908 are typical of his vigorous support of the merit system.

Conservation of National Resources.—If Mr Roosevelt did not invent the idea of the conservation of public natural resources— a development which made Conservation in 1910 the foremost political and social question in the United States. The old theory was that the general prosperity of the country depends upon the development of its natural resources—a development which involves the setting up of new officers for political purposes in the campaign of 1908 are typical of his vigorous support of the merit system.
the United States, in return for a commercial and military protection advantageous to Panama, the right to build a canal and control it in perpetuity. His critics said that his course in this matter was unconstitutional, although the question of constitutionality was not raised before the United States Supreme Court or the tribunal. The fact remains that the construction of the Panama Canal was undertaken to the practical satisfaction to the civilized world. But for Mr. Roosevelt's vigorous official action and his character, these past speeches with his subsequent policy in Church for which the canal would still be a subject of diplomatic discussion instead of a physical actuality.

Colonial Policy.—Strictly speaking, the United States has no colonial policy, for the Philippine Islands and Porto Rico can be called colonies. It has, however, a policy of territorial expansion. Although this policy was entered upon at the conclusion of the Spanish War under the presidency of Mr. McKinley it has been largely developed under Mr. Roosevelt. He determined that Cuba should not be taken over by the United States, as all Europe expected it would be, and an influential section of his own party hoped it would be, but should be given every opportunity to govern itself as an independent republic; by assuming the supervision of the finances of San Domingo, he put an end to controversies in that unstable republic, which threatened to disturb the peace of Europe; and he personally inspired the body of administrative officials in the Philippines, in Porto Rico and (during American occupancy) in Cuba, who for efficiency and unselfish devotion to duty compare favourably with any similar body in the world. In numerous speeches and addresses he expressed his belief in a strong colonial government, which would free him from the troubles caused by people under its control and not for the profit of the people at home. In this respect, for the seven years of his administration at Washington, he developed a policy of statesmanship quite new in the history of the United States.

No account of Mr. Roosevelt's career is complete without a reference to his literary work, which has been somewhat overshadowed by his reputation as a man of public affairs. He was all his life an omnivorous reader of the best books in very varied fields of literature, and he developed to an unusual degree the faculty of digesting and remembering what he had read. His history of the War of 1812 between the United States and Great Britain, written when he was twenty-four years old, is still the standard history of that conflict, and his History of the War of the Revolution is probably the best work which has been written on American frontier life of the 18th century, a life that developed certain fundamental and distinctive American social and political traits. His African Game Trails, the record of his scientific hunting expedition in Africa in 1899-10, is much more than a narrative of adventures on a wild continent. It is a study of social and ethnological conditions, and contains many passages of literary charm, describing bird life, animal life and natural scenery. An appendix that gives some account of the "Pigskin Library" which he carried with him for daily reading in the heart of Africa is a surprising exposition of the wide range of his reading. As a public speaker his style was incisive, forceful and often eloquent, although he made no effort to practise oratory as an art. The volume of his African and European addresses, published in the autumn of 1910, not only presents an epilogue of his political philosophy, but discloses the wide range of his interest in life and the method by which he had striven to bring public opinion to his point of view.

Personally of great physical and mental vigour, his work was done at high pressure and he had the faculty of inspiring his colleagues or his subordinates with his own enthusiasm for doing things. The volume of his letters and his writings in books, articles for the press and speeches and official messages, is enormous, and yet this work was done in the midst of the executive labours of a long political career. Besides being famous as a hunter of big game, he was a skilful horseman and a good tennis player. Regular physical exercise in the open air contributed much to his abounding vitality. A man of decisive action when his mind was made up on any given question, his very decisiveness sometimes gave the impression that his judgments were hasty. On the contrary, few men were more deliberate in considering all sides of an important problem. His long experience, his wide reading and his thorough knowledge of all sorts and conditions of men, enabled him to act quickly at a time of crisis, but his important speeches, or a course of political action that might be far-reaching in its effect, were not cast into their final form without careful consultation with the best advisers he could retain. The first form of his written speeches was always painstakingly revised and edited, and not infrequently entirely rewritten. He expressed his own judgment of his success as a public man by saying that it was not due to any special gifts or genius, but to the fact that by patience and laborious persistence he had developed ordinary qualities to a more than ordinary degree. (L. F. A.)

The following is a list of his principal works:—The Naval Operations of the War between Great Britain and the United States 1812-1815 (1882), written to correct the history of James; Thomas Hart Benton (1897) and Gouverneur Morris (1888), both in the American Statesmen Series; New York City (1891; revised 1895) in the Historic Towns Series; Hero Tales, from American History (1895) with H. C. Lodge; Winning of the West (4 vols., 1889-96); a part of the sixth volume of the History of the Royal Navy of England (1898) by W. L. Clowes; The Rough Riders (1899); Oliver Cromwell (1901); the following works on hunting and natural history, Hunting Trips of a Ranchman (1886), Ranch Life and Hunting (1889), The Wilderness Hunter (1893), Big Game Hunting on the Rockies and on the Plains (1892); a republication of Hunting Trips of a Ranchman and The Wilderness Hunter, The Deer Family (1902), with other authors, and African Game Trails (1910); and the essays American Ideals (3 vols., 1897) and The Simplest Life (1900); Speeches, Papers and Addresses, 1898-99; Speeches, Papers and Addresses (1910). Several of his works have been translated into French and German. Uniform editions were published in 1900 and 1903. Early in 1909 he became a "contributing editor" of the Outlook.

ROOT, ELIHU (1845-1918), American lawyer and political leader, was born at Clinton, New York, on the 19th of February 1845, the son of Oren Root (d. 1885), professor of mathematics at Hamilton College from 1849-81. He graduated at Hamilton College in 1864, taught at Rome (N.Y.) Academy in 1865, and graduated at the University Law School, New York City, in 1867. As a corporation lawyer he soon attained high rank and was counsel in many famous cases. Politically, he became identified with the reform element of the Republican party. He was United States attorney for the Southern District of New York (1883-85), and a delegate to the State Constitutional Convention of 1894, acting as chairman of its judiciary committee. From August 1890 until February 1904 he was secretary of war in the cabinets of McKinley and Roosevelt, and in this position reorganized the army and created a general staff, and in general administered his department with great ability during a period marked by the Boxer uprising in China, whither troops were sent under General A. R. Chaffee, the insurrection of the Filipinos, the withdrawal of the United States troops from Cuba, and the establishment of a government for the Philippines under a Philippine Commission, for which he drew up the instructions, in reality the American constitution, codifying a series of laws. In 1903 he was a member of the Alaskan Boundary Tribunal. In July 1905 he re-entered President Roosevelt's cabinet as secretary of state. In the summer of 1906, during a visit to the Pan-American Conference at Rio de Janeiro, he was elected his honorary president, and during a tour through the Latin-American republics, brought about a better understanding between the United States and these republics. In general he did much to further the cause of international peace, and he concluded treaties of arbitration with Japan, Great Britain, France, Italy, Spain, Portugal, Austria-Hungary, Switzerland, Norway, Sweden, Denmark, Holland and other countries. Upon his resignation from the cabinet he was elected, in January 1909, as United States senator from New York. In 1910 he was chief counsel for the United States before the Hague tribunal for the arbitration of the long-standing dispute concerning fisheries between his country and Great Britain (see NEWFOUNDLAND). He received the degree of LL.D. from
ROOT

Roots which originate elsewhere than as acropetal outgrowths of a main root are known as adventitious, and may arise on any part of a plant. They are especially numerous on underground stems, such as the under side of rhizomes, and also develop from stem nodes under favourable conditions, such as moisture and absence of light; a young shoot or a cutting placed in moist soil quickly forms adventitious roots. They may also arise from leaves under similar conditions, as, for instance, from begonia leaves when planted in soil.

The forms of roots depend on their shape and mode of branching. When the central axis goes deep into the ground in a tapering manner, without dividing, a tap-root is produced. This kind of root is sometimes shortened, and becomes swollen by storage of food-stuffs, forming the conical root of carrot, or the fusiform or spindle-shaped root of radish, or the napiform root of turnip. In ordinary forest trees the first root protruded continues to elongate and forms a long primary root-axis, whence secondary axes come off. In primary plants, especially Monocotyledons, the primary axis soon dies and the secondary axes take its place. When the descending axis is very short, and at once divides into thin, nearly equal fibrils, the root is called fibrous, as in many grasses (fig. 4): when the fibrils are thick and succulent, the root is fasciculated, as in Ranunculus ficaria, Asphodelus laterus, and Oenanthe crocata; when some of the fibrils are developed in the form of tubercles, the root is tubercular, as in dahlia (fig. 5): when the fibrils enlarge in certain

Fig. 5. Root- Tubers of Dahlia variabilis. The lower portions of the cut stems, parts only, the root is nodulous, as in Spiraea Füspendula, or moniliform, as in Pelargonium triste, or annulated, as in Ipecacuanha. Some of these so-called roots are formed of a stem and root combined, as in Orchis (fig. 6), where the tuber consists of a fleshy swollen
ROPE AND ROPE-MAKING.

The plant is dependent for its water-supply. The aerial roots of the
ivy are not the nutritive roots of the plant, but are only intended
for mechanical support. The climbing roots of many orchids, aroids
and epiphytic ferns branch and form places of lodgment for humus
into which absorbent branches of the climbing roots penetrate.
Some leafless epiphytic orchids, such as species of Angraecum, depend
directly upon their aerial roots for nourishment; the roots, which
are green, perform the functions both of leaves and roots. A
respiratory or aerating function is performed by roots of certain
rhizomes growing in swampy soil or water and sending vertical
roots up into the air which are provided with aerating passages by
which the root system below can communicate with true outside air.
Parasitic plants, like the mistletoe (Viscum), brome-rope (Orobanche)
and Rafflesia, send root-like processes into the substance of the
plants whence they derive nourishment. In the dodder (Cuscuta), the tissue
around the root swells into a kind of sucker (haustorium), which is
flat upon the other plant, and ultimately becomes concave,
so as to attach the plant by a vacuum. From the bottom of the
sucker the root protrudes, and penetrates the tissue of the host
plant. Leaf-buds are sometimes formed on roots, as in plum,
cherry and other fruit trees; the common elm affords an excellent
example, the young shoots which grow up in the neighbourhood
of a tree arising from the roots beneath the soil. In some plants
no roots are formed at all; thus in the orchid Corallorhiza, known
as coral-root, a stem-structure, the shortly branched underground
rhizome, performs all the functions of a true root which is absent.
In aquatic plants the root acts merely as a holdfast or is altogether
absent as in Subtria, Utricularia and others.

ROPE AND ROPE-MAKING. All varieties of cordage having
a circumference of an inch or more are known by the general
name of "rope." Twisted cordages of smaller dimensions are
called cords, twines and lines, and when the sectional area
is still smaller, the article is known as thread or doubled yarn.
All these varieties of cordage are composed of a number of
separate yarns, each of which is made from some kind of textile
fibre by preparing and spinning machinery. The number of
separate yarns which ultimately form the rope or cord depends
upon the fineness of the yarn, and also upon the circumference
of the finished article. From thread and fine twine upwards
the whole art of manufacture is that of twisting together fibres
and yarns; but the comparative heaviness and coarseness of
the materials operated on in rope-making render necessary
the adoption of heavy machinery and modified processes which
clearly define this manufacture as a distinct calling. The
modern trade of rope-making is again divided into two distinct
branches dealing with vegetable fibres and metallic wire.
Many different vegetable fibres are used for rope-making,
but for the combined qualities of strength, flexibility and
durability, none can compete with the common hemp, which
is consequently the staple of the rope-maker. Cotton ropes
are, however, much more flexible, and in addition are strong
and durable; they are, therefore, much preferred for power
transmission in textile and other works. Manila hemp is a
fibre of remarkable tenacity, of unapproached value for heavy
cordage, but too stiff for small cords and twines. After these
in utility come Sisal hemp of Central America (Agave Sisalana),
Phormium hemp of New Zealand (Phormium tenax) and Sunn
hemp of the East Indies (Crotalaria juncea)—all fibres of great
strength, and largely used by rope-makers. Jute (q.v.) of
India (Corchorus capsularis and C. olitorus) is now largely
used by rope-makers on account of its cheapness. When used
alone it is deficient in strength and durability, but when used
in conjunction with proper proportions of hemp it makes a
very satisfactory and useful rope. Among fibres more rarely
seen in rope-works are Jutapulp hemp (Crotalaria tenfolia),
boxstring hemp (Sansevieria cvlanica), and other hempas of
the East Indies, plantain fibre (Musa paradisica), and agave fibre
(Agave americana) of America. Coir and many other fibres
are used, but principally in the localities of their production.

A rope is composed of a certain number of "strands," the
strand itself being made up of a number of single threads or
yarns. Three strands laid or twisted together form a "hawser-
laid" rope, and three such hawsers similarly laid make a
"cable-laid" rope or "cable." A "shroud-laid" rope usually
consists of four strands laid around a central strand or core.
The prepared fibre is twisted or spun to the right hand to form
yarn; the required number of yarns receive a left-hand twist
to make a strand; three strands twisted to the right make a
hawser; and three hawsers twisted to the left form a cable.
Thus the twist in each operation is in a different direction
from that of the preceding one, and this alternation of direction
is necessary for the coiling of some kinds of ropes.

The primary object of twisting fibres together in a rope is
that by mutual friction they may be held together when a
strain is applied to the whole. Hard twisting has the further
advantage of compacting the fibres and preventing, to some
extent, the penetration of moisture when the ropes are exposed
to water; but the yield of rope from a given length of yarn
diminishes in proportion to the increase of twist. The proper
degree of twist given to ropes is generally such that the rope is
from three-fourths to two-thirds the length of yarn composing it.

Rope-walk Spinning.—The sequence of operations in this
method of working is as follows: (1) hacking the fibre;
(2) spinning the yarn; (3) tarring the yarn when necessary;
(4) forming the strands; (5) laying the strands into ropes.
Hacking differs but slightly from the hand-hacking process
used in the preparation of flax. The hackle board consists of
a wooden block studded with strong, tapered and sharp-
pointed steel prongs. A series of such hackle boards is used in
the progressive hacking operation, the prongs diminishing

Fig. 6.—Base of plant of Orchis, showing tuber-
cles or tuberous roots.

Fig. 7.—Ficus indica, the Banyan tree, sending out numerous
aerial roots, which reach the soil, and prop the branches.
in size and being more closely set together. For the commoner kinds of ropes, however, hackling through the coarsest board is found to be sufficient, while in most other cases two hacklings are adopted.

The hacker takes up a handful or "streak" of hemp from the bundle, wraps one end firmly round his hand, and with his fingers distributes a little oil over the hemp. The oil softens the material, keeps the hackle pins in good condition, and facilitates generally the splitting up of the fibre as the streak is drawn through the pins. In the first place, only the ends of the streak are hackled; they are dashed into the pins and drawn through them in order to separate the fibres and to lay them parallel; but as the operation proceeds a gradually increasing length of the streak is thrown on and drawn through the pins. The process is indeed very similar to the combing out of a head of human hair. When half the length of the streak is thoroughly combed, the other half is treated in precisely the same manner. The hackled streak is then weighed, doubled up to prevent any entanglement, and laid aside for the process of spinning. During the hackling process a large quantity of comparatively short fibres are retained in the pins; the longest of these are separated, and the remainder used for tow yarns. The above description refers entirely to hand hackling; machine hackling of hemp is very similar to flax hackling.

The spinning is done in what is termed the "rope-walk," and from the nature of hand-spinning, and the length of the rope required, it is necessary that this walk should be from 300 to 400 yds. in length. It is sometimes completely covered in with walls and roof; at other times only a roof is built; while in exceptional cases the whole of the walk, with the exception of a small hut at each end, is without shelter of any kind. The operation of spinning is very important, as the weight of the yarn and the appearance of the finished product depend upon it. A description of spinning and laying as performed by the aid of the hand-wheel will perhaps be the best means of giving an idea of this useful branch of manufacture.

hooks B, C or D; the assistant at the wheel begins to turn, and thus a certain amount of twist is imparted to the material between the spinner and the hook. The spinner now walks backwards down the walk, drawing out the fibre with his left hand and adjusting it with his right. A piece of flannel or woollen cloth held in his right hand aids in the formation of the thread and protects his fingers from the rough fibre. In some cases two threads are spun simultaneously; when this is done, two of the hooks, say B and C, are used at the same time. Since the revolutions of the hook divided by the length of yarn spun on the hook for the amount of twist per inch shows the ratio of the walking pace of the spinner to the revolutions of the wheel A should be constant, otherwise the yarn will not be uniform. The spinner calls to the assistant when there is any irregularity in speeding the yarn, while, on the other hand, he is obliged to stop walking.

At convenient intervals in the length of the walk, and projecting from posts, are short horizontal bars; the top of each bar is provided with wires or pegs to form a number of vertical partitions something like the pins of a hackling board, in which a row of fibre is inserted. As the spinner proceeds down the walk, he throws the spun yarn into one of these partitions, thus relieving himself of the weight and keeping the yarn off the ground. When a sufficient length of yarn has been spun, he breaks off the fibres and fastens them to a convenient peg or hook until he has spun a sufficient number (usually three) to form a small rope or cord.

The person at the wheel hangs these three yarns on each of the three hooks B, C and D, while the spinner attaches the other ends to a revolving hook termed a "loopier." All is now ready for laying the yarns over the small cords, so that the yarn may be laid on without a "top." This top is a conical-shaped piece of hard wood provided with three equidistant grooves which merge towards each other at the thin end, and into which the yarns are laid. The thick end of the top is then made to revolve, and the yarns are so placed that they hang at right angles from the hook and are thus at the same time laid on without a "top." As the hooks twist the three threads, the spinner goes up the walk with the top; the twist in the yarns causes the looping hook to revolve in the opposite direction to the other hooks, and thus it fasts the three threads in the opposite direction to the original twist.

Fig. 3 shows one form of top, the three yarns being shown in distinctive marks so that the path of each may be more easily followed by the reader; a plan of the thick end of the top appears to the left of the figure. If four yarns of strands are required, the top should contain four grooves, as well as a central core to admit of a core when such a thing is required. As soon as the spinner, who carries the top, arrives at the wheel, the assistant takes the yarns off hooks B, C and D (figs. 1 and 2), and puts them all on the hook E. If the other ends of the strands are already fastened to a looper and attached to a block of wood called a "drag," the wheel is then rotated as before, which puts more twist into the cord. While this operation, which is termed hardening, proceeds, a shrinkage in the length of the cord takes place, the drag is consequently drawn up the walk. The drag, however, holds the cord taunt, and serves to retain the twist which is imparted by the hook E. If the strands require tarring before they are laid, they are separately taken off the hooks, after they have been spun, and tied at both ends to pegs to keep them taut until a sufficient number has collected to be conveniently handled at the tarring tank. The tar is heated to about 220° F., and the strands are then passed through it at a speed not greater than 15 ft. per minute. Before emerging from the tank, the strands pass between squeezing rollers which remove all superfluous tar. In a short time the strands are dry, while in the space of a few days the tar is hard enough to allow the strands to be formed into ropes.

Such is, in general, the hand process of forming ropes when they are composed of only three or four single yarns. It very often happens, however, that a number of single yarns are required to form each strand of the rope. The single yarns may be spun by hand, as described above, or by machinery. In the latter case the group of yarns is usually termed a "haw," while the machine-spun yarns are formed into what is known as a "warp" or "chain." In any case, the group of yarns is stretched down the rope-walk, at each end of which is attached a hook three inches long iron or wood. The number of hooks in the group—the number depending upon the size of the yarn and also upon the required diameter of the strand—are then placed on a hook of the jack twister and twisted together. When three such strands are made they are laid into a rope in a similar manner to that explained above. A simple form of hand jack twister is illustrated in figs. 4 and 5. The wheel A bears pins B on the shafts of the hooks or whirls, and this imparts the necessary motion to the latter. At the other end of the walk is a similar machine which moves upon rails as the twist is put into the strands. When the hooks are empty, pinions B and wheel A (fig. 4) are out of gear, but those hooks carrying yarn are drawn out, as shown at C, until the pinion B gears with wheel A, when the hooks are rotated.

Sequence of operations is very similar to that described for the simple hand-wheeled.

Figs. 4 and 5.

Machine or Factory Rope-Making.—The modern methods of rope-making are far superior to the foregoing, which, as stated, have been introduced to show the principle. One of the greatest drawbacks in the formation of a strand from a haor or chain, even for a small number of yarns, is the irregularity of the tension of the yarns at different parts of the strand. If a large number of yarns are required for each strand, it would be almost impossible to make a satisfactory rope by the above system. If, however, the strand be made from bobbins, each yarn bears its proper share of the tension, and an almost perfect rope is obtained.

Two mechanical methods are in use for the spinning of long vegetable fibres—the ordinary and the special. When flax or jute yarns are required, they are almost invariably spun on the ordinary spinning frames, and the yarn wound from the spinning bobbins on warping bobbins, or else rewound in the shape of rolls or cheeses. Hemp yarns, especially the finer kinds, are sometimes treated in the same manner, but Manila hemp, New Zealand hemp (Phormium), and similar fibres, are invariably spun on bobbins by special machinery. The strands for light ropes may then be made on the twisting frames, and the rope finished on what is called a "house machine." When a large rope is desired, a slightly different method is usually employed. The bobbins from the automatic spinner, or the rolls from the winding frame, are placed upon pegs in a frame which answers the same purpose as a bank or creel used in conjunction with a warping machine. If the rope is to be say 2 in. in circumference, there may be, with fine yarns, 300 or more individual threads in its composition. Suppose that 300 threads are to be used, then 300 bobbins would be placed on the pegs of the bobbins bank or creel, and divided into three sets of 100 threads each for a three-strand rope. The threads are passed separately through a register plate, which is simply a plate containing a sufficient number of holes for the maximum quantity required, and arranged in a series of concentric circles. There are three sets of concentric rings used in the plate for a three-strand rope, and four sets for one of four strands. As the threads emerge from the register plate they are grouped together and passed through a tapered tube, the sectional area of the smaller end of the tube being equal to the sectional area of the strand. This operation is done for each group of 100 threads, and finally the three or four groups are attached to separate rotating hooks of the forming machine or "traveller." As the latter moves down the walk on rails, it draws the threads from the bobbins in the bank, and through the register plate and tubes, while the hooks put in the twist. A perfectly circular strand, without slack threads, is thus formed; and, at the same time, a uniform strand is obtained, since the ratio of the speed of the traveller to the number of turns per inch of the hooks is constant. The process is continued until the desired length of strand is made—about 150 fathoms (300 yds.) of each of the three strands are required for 100 to 120 fathoms of rope—then a little more twist is introduced. Afterwards, all three strands are placed on one hook of the traveller, and the ends from the shaping tubes are cut off and put on the hooks of the fixed machine, called the "fore-turn." The carriage containing the "top" is now brought close to the traveller, and the strands are placed in the grooves of the top as explained under hand-lying. Similar means to those used in hand-lying are adopted for keeping the rope off the ground. The two machines are now started, the three hooks of the fore-turn machine revolving in one direction and the single hook of the traveller revolving in the opposite direction. Simultaneously the carriage with the laying top moves forward towards the head of the walk.

Fig. 9, Plate I., shows many stages in the process of rope-making. The most prominent part shows the carriage with the top in position approaching the fore-turn machine at the head of the walk. The person on the right of the carriage is holding a top in his left hand, while the top in the carriage is laying a rope of four strands. At other parts of the figure appear three or four travelling machines, containing the strands, others moving up the walk as the laying proceeds, while on the extreme right one machine is laying two ropes, of three strands each, at the same time.

We have already stated that the yarns for the above machine may be prepared by two systems. When the hemp fibre is spun on the ordinary frame, the method of preparation for such a frame is somewhat similar to that employed for flax, but since the fibre is harsher than flax, it is invariably respun, the loosely wound yarns are crushed as in the case of jute, but the fluted rollers are arranged to form part of a circle. The coarser fibres receive a somewhat different treatment; the first process in the preparation of Manila hemp is stated to be similar in that former roll, as shown in fig. 10. Plate I. The strands are clearly shown as being led between fluted rollers on to the pins of the hacking and spreading machine; the lanterns or skeleton rollers, seen on the extreme right, press the fibres into the pins. A little oil is made to drop on to the fibre in order to soften it and to facilitate the operation. The oiling apparatus is usually of a simple character, and consists of a revolving roller partly immersed in an oil bath. The roller is driven as shown in the figure, and the oil which it draws up is sprayed off its surface by small jets of air. As soon as the fibre is properly oiled, and has been led over the fluted rollers and the gill-pins, a view of a similar machine is shown in fig. 11, Plate II., from which it will be seen that there are two sheets of revolving gill-pins. The sheet nearest the feed-cloth receives the fibre slightly in the same manner as the second sheet of rollers, while the second sheet moves at a much higher rate. The difference in the speeds of the gill-pins results in the fibre being combed out and straightened, while the delivery rollers, the surface apparatus, the function of which is, as its name implies, to regulate the delivery of the sliver to the nippers. The delivery is increased or decreased according as the sliver is thin or thick. Consequently, a very even yarn results; indeed, it is claimed that for uniformity of yarn this system of spinning has no equal. The bobbins, which
are placed in a horizontal position, have a lateral movement, so that the finished yarn may be wound on evenly. This machine is made for ordinary rope yarn, and for binder twine for self-reaping machines. When all three spreading machines are used, the combinations with the spiral drawing frame, the automatic feeding arrangement is sometimes considered unnecessary, because of the uniformity of the slivers when delivered from the finishing drawing frame.

Figs. 14 and 15, Plate III., show two sheds filled with preparing machinery for the manufacture of binder twine. A complete system of Manila machinery, as recommended by Messrs. Lawsons, Leeds, would consist of the following:

1. No. 1 spreading and hacking machine.
2. No. 2 spreading and hacking machine.
3. Spiral drawing frame or jenny.
4. 1st spinning frame (head), 88 in. rear, 4 slivers per head.
5. 2nd spinning frame (head), 88 in. rear, 6 slivers per head.
6. 3rd, 4th, 5th, 6th, 7th, 8th, 9th, 10th, 11th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 19th, 20th improved automatic spinners or jennies of 2 spindles each.

The length of sliver from a given length of fibre is proportional to the drafts and inversely proportional to the doublings. Thus, if

\[ d_1, d_2, d_3, d_4, d_5, d_6 \]

are the bobbins, machines, each containing three strands, and

\[ S_1, S_2, S_3, S_4, S_5, S_6 \]

are the number of slivers,

\[ I = \text{the feet per lb. on the feed-table of No. 1 spreading machine, } \]

\[ L = \text{the feet per lb delivered at the automatic spinner, then: } \]

\[ I = \frac{d_1 + d_2 + d_3 + d_4 + d_5 + d_6}{S_1 + S_2 + S_3 + S_4 + S_5 + S_6} \]

A numerical example, showing the drafts, slivers, &c., used for the production of No. 22 rope yarn of 330 lb. per lb. appears as:

\[ I = \frac{15.5}{1} \times \frac{15.5}{12} \times \frac{15.5}{12} \times \frac{7.4}{4} = \frac{9.7}{4} \times \frac{5}{4} = 330 \text{ lb. per lb.} \]

When \[ I = 936 \text{ ft. } \]

\[ S = 54 \text{ ft. per lb. } \]

is taken, the No. 1 frame of Manila fibre, approximately 6 in. in length, spread on the feed-table of No. 1 spreading and hacking machine, and subjected to the above drafts and doublings, would produce yarn No. 22 of 330 lb. per lb. from the automatic spinner. The bobbins from these automatic spinners may be used in the bank at the rope-walk as already indicated, or they may be taken to the house and termed a "house machine." These machines are of two distinct kinds—vertical and horizontal. They perform the same work as the machines in the rope-walk, but take up much less space.

Figs. 16 and 17, Plate IV., illustrate two types of horizontal machines, each of which is capable of completing a rope in one operation. The process is pretty clear in fig. 17, which shows that eighteen threads are treated at once. On the right, and driven by spur gearing, are three revolving carriages or creels, each containing six bobbins. Each group revolves as the yarns are drawn off the bobbins, and thus the threads are formed into three strands. As the strands emerge from the guides, they converge towards three other guides, are laid together, and finally the finished rope is wound on to the reel.

In principle the vertical machine is the same as the horizontal machine, and the rope is, consequently, made in one operation. Any number of bobbins, from 24 to 128, may be twisted at the same time; the machine in fig. 18, Plate IV., is for making a rope of three strands, each with 12 threads, or 36 threads in all. These machines are also made to make ropes of four strands. The strands are formed by the rotation of the carriages, from the top of which each strand passes. The three strands then converge to, and pass through, the top of the machine, where they are laid into a rope. The latter passes over a series of guide pulleys, and is ultimately wound up in the reel. The machine is suitable for making a 128-thread, four-strand rope, occupies only about 125 sq. ft.—8 ft. 9 in. x 14 ft. 4 in.

In addition to the heavy rope there are many varieties of cord and twine made by means of the preparing, spinning and doubling machines. The fishing industry takes many different types for lines and nets, while the variety of cord and twine for other industrial and for household purposes is almost unlimited. All yarn from long vegetable fibre is more or less rough as it leaves the spinning frame, even after two or more threads have been twisted together. It is therefore necessary, for many uses, to impart a polish to the cord or twine. Special machines are used for this purpose. A certain number of bobbins, depending upon the capacity of the machine, are placed in a bank, and the ends are collected and passed under a roller which is immersed in hot starch. The yarns become saturated with this starch, but, as they emerge from the starch-box, the superfine starch is removed by passing the yarns between two rollers. The yarns now pass over a series of drawing cylinders and polishing rollers, and are finally rewound by the same machinery on bobbins. These machines are termed bobbin-to-bobbin polishing machines. In some cases the hot drawing cylinders are replaced by a system of hot air drying. The finished yarns are now made up by machinery into hanks, balls or cheeses, according to which happens to be the best state for future use and for transport.

Driving Ropes.—It has already been stated that cotton driving ropes are extensively applied in the transmission of motive power. Although the mechanical efficiency of transmission by ropes is less than that obtained by wheel gearing, rope driving has several compensating advantages:

1. It is practically noiseless.
2. It occupies less space than belt driving, and the slip is not so great.
3. The turning movement is better; machines therefore run more steadily and production is increased.
4. Shafts may be run at higher speeds.
5. Greater range of drives; anything from 10 ft. to over 80 ft., and much greater distances when carrier pulleys are used.
6. The drive is usually obtained by a number of ropes; if one should break, the rope may be removed and the machinery may be run by a most considerable number of ropes.

The number of ropes to be used depends upon the power to be transmitted and upon the surface speed of the driving pulley. The speed of the rope may vary from 2000 ft. to 6000 ft. or over per minute. In some few exceptional cases 60 ropes have been used on one pulley; the number usually varies between 15 and 40. (See also Power Transmission, § Mechanical.) Fig. 6 shows the application of these ropes, which pass direct from the main driving pulley to the different flats of the mill. Fig. 7 shows the construction of the Lambeth four-strand cotton rope. There are two distinct systems of arranging the ropes on the driver and the driven pulleys. In the United Kingdom each rope is independent of all the others, and, as it is unlikely for more than one rope to break at a time, the stoppages are reduced to a minimum. In America, where hemp ropes are largely employed,
Fig. 14.—Binder twine preparing, Connswater mill, of the Belfast Ropework Co. Ltd.

Fig. 15.—Binder twine spinning, Connswater mill.
the continuous system is mostly used; here the rope is wound round and round over driver and driven, and, except in rare cases, is joined only at one place. Although the system has the great advantage of the minimum number of joinings, it requires tension pulleys to keep the ropes taut. It is also clear that when the rope breaks at any point the machinery must stand until the repair is completed.

Wire Ropes.—Although the manufacture of ropes is of ancient origin, the practice of making ropes from wire on a large scale is of comparatively recent date. Since 1874, however, great developments have taken place in the manufacture of ropes from different kinds of wire, and the uses for which they can be put have enormously increased. This is owing almost entirely to the introduction of flexible wire ropes which were invented about this time by Messrs Bullivant & Co. Ltd., of 72 Mark Lane, London, E.C. Prior to that date the uses at which wire ropes were put limited to winding ropes for collieries and hauling, and to cases in which flexibility was not a great desideratum. The introduction of flexibility, however, made possible the use of wire rope for ships' hawser and rigging, for cranes, derricks and other purposes for which hemp ropes were formerly employed.—indeed it has almost entirely superseded hemp for marine uses. The reason is that it is much stronger for the same size than rope made from any other material, whilst for the same strength its size and weight are only about one-third that of hemp rope. Consequently, the required power may be obtained with a wire rope of comparatively small bulk.

Wire rope is specially suited for aerial ropeways which provide a means of conveying ore, metals, merchandise, &c., over ground where it would be difficult to arrange transport by ordinary means. Messrs Bullivant & Co. Ltd., to whom we are indebted for the table of strengths and other particulars, as well as for the sectional illustration of wire ropes, construct seven different systems of aerial ropeways:

1. The endless running rope, with carriers hanging therefrom and moving with it through frictional contact.
2. An endless rope, with the carriers hanging therefrom and moving with it, being rigidly fixed in position on the machinery.
3. The fixed rope, in which the carriers are drawn along and hang from a fixed rope which acts also as a rail, returning on a parallel rope.
4. The single fixed rope, in which one carrier, hanging from a fixed rope, is drawn to and fro by means of an endless hauling rope.
5. The use of two fixed ropes with an endless hauling rope, in which one carrier travels in one direction, while the other travels on a parallel rope in the opposite direction. This is a serviceable type of ropeway, capable of being used over extremely long spans, and of carrying loads up to 6 tons.
6. The use of one fixed rope placed on an incline, on which the carriers (uncontrolled by hauling ropes) with their suspended loads are allowed to run down at a high speed. This is generally called a "shoot.
7. Bullivant's system of aerial ropeway for raising, lowering, and transporting heavy loads, by means of which a load can be hoisted, traversed in either direction and deposited at one operation.

The capacity of a wire rope depends upon the number of wires of which it is formed; consequently the use to which a rope is to be put will partly determine the number of wires used in its construction. In some cases nearly 400 individual wires are employed in making one rope. Fig. 8 shows in section ten different types of construction, the particulars of which appear below:

1. Laid rope made of 6 strands of 7 wires each. This is the class of rope most frequently used for hauling ropes where the size of the barrel and sheave will permit; it is also the make of rope in general use for standing rigging, and is used in tenon-hauling by Lloyd's regulations.
2. Hauling rope made of 6 strands, each strand being of 7 wires covering 7 smaller ones.
3. Hauling rope made of 6 strands, each of 8 wires covering 7 smaller ones.
4. Hauling rope made of 6 strands, each of 10 wires covering 7 smaller ones.
5. Formed rope made of 6 strands of 19 wires each. In larger sizes this make of rope is used for standing rigging on vessels. In smaller sizes it is sometimes used for hauling rigging, and it is the usual make of rope for trawl warps.
6. Flexible steel wire rope, made of 6 strands each of 12 wires, with hemp heart and hemp centre in each strand. This is the make and hard steel flexible wire rope, 5/8 in. in circumference and smaller; used for shawls, running big lines, &c.
7. Extra flexible steel wire rope made of 6 strands each of 24 wires.
8. Superior extra flexible steel wire rope made of 6 strands each of 37 wires.

The following table supplies particulars about wire ropes which are used for general hauling purposes:

The diameter of drums and sheaves should be about thirty times the circumference of the rope.

For shaft winding at high speed one-tenth of the breaking strain of a rope is sometimes taken as a fair working load. For inclines, the proportion of load to breaking strain varies according to gradient conditions, and friction should be allowed for.

The first requisite in the manufacture of wire ropes is the selection and blending of the different iron ores. The different processes through which the metal passes, and the hammering and drawing into rods, require great experience, and give it to the peculiar properties that are essential for the finished article. The same remarks apply to the annealing and hardening processes, during which the rods are drawn through dies to the required gauge. The wire is now subjected to special processes of galvanizing in order to make it proof against atmospheric and other influences. Afterwards it is wound on bobbins of suitable size, a definite number of which are mounted on the forks or frames of the winding machine. These forks are swung or pivoted between disks, which are keyed on by a hollow main shaft, through which the wires or other material
intended for the core pass. This core is of such a size that the aggregate number of wires that are mounted in the machine exactly cover it in a spiral direction.

All the wires, including the central core, are passed through their individual hollow bobbins, which are then led to the nose or head of the machine, and finally passed through a stationary compression block to draw-off wheels. The speed of these wheels is regulated in proportion to the speed of the machine by means of suitable gearing. During the operation, the finish line of the wire drawn from the main bobbin is kept in a vertical position, and floats thus, by means of an eccentric ring behind the back disk. This ring is connected to the spindles of the bobbin forks by means of small cranks, thus preventing any torsional movement that would otherwise be imparted to the individual wires.

Each bobbin is controlled by a brake which acts as a tensioning device so that equal strain can be applied to each, allowing the wires to be wound tightly and in a spiral manner. The wires are led alternately over and under turn upon large bobbins, and mounted in the flyers or disks of the rope closing machine. These machines are similar in design to the stranding machine, but are naturally much heavier in construction, and therefore revolve at a proportionate speed. The speed of the machines varies according to the weight of material, the size of the strands and the construction of the finished rope. The modern machine, or the type most generally used, makes about fifty turns per minute, while at three times this speed is often obtained when spaining the strands.

The rapid strides made by electricity have furnished another large branch of what may be termed wire rope manufacture. The ropes for electrical purposes are almost invariably stranded cables, and there are many different kinds and sizes of them. The wire must necessarily possess good conducting power, and be comparatively cheap. Up to the present copper has proved to be the chief material possessing these two important properties. The usual stranded wires are of a most eccentric and unimportant dielectric character. Aluminium and alloys have been tried with varying degrees of success.

The conductor itself consists of a strand of soft copper wires, around which the dielectric or non-conducting material is placed. The methods of forming the strands do not differ essentially from those described above. The dielectric is usually paper, spun jute fibre, vulcanized India-rubber or vulcanized bitumen. If the first two are used, they lead to a more expensive and less insulated strand and so exclude moisture; if the cable is likely to get damaged, it is further enclosed by steel tapes or steel wires, and finally covered with yarn or braid. Vulcanized bitumen is the usual substitute for paper, and is cheap and also impervious to moisture. Hence in many instances where paper or fibre is employed as the principal dielectric, a sheath of vulcanized bitumen is used instead of lead to exclude moisture. Cables are also made with a single central strand of copper wires in addition to one or more concentric layers of copper wires, the layers being separated by some dielectric material; or there may be two or more strands, separately insulated, and more or less elaborately clothed with the above-mentioned substances.

ROPS, JOHN CODMAN (1836-1890), American military historian and lawyer, was born at St Petersburg on the 28th of April 1836, the son of a leading merchant of Boston who was engaged in business in Russia. At the age of fourteen, his family having meantime returned to Massachusetts, he developed an affection of the spine which eventually became a permanent deformity. His courage and energy, however, did not allow him to yield to his affliction. He entered Harvard in 1853, and graduated in 1857. His interests as a young man were chiefly religious, legal and historical, and these remained with him throughout the whole of his career as a man of letters, and were the principal bases of his successful practice. It was the outbreak of the Civil War in 1861 which fixed his attention principally on military history. He ceaselessly assisted with business and personal help and friendship the officers and men of the 20th Massachusetts regiment, in which his brother, Henry Ropes, served up to his death at Gettysburg, and after the war he devoted himself to the collection and elucidation of all obtainable evidence as to its incidents and events. In this work his clear and unprejudiced legal mind enabled him to sift the truth from the innumerable public and private controversies, and the ill-informed allotment of praise and blame by the popular historians and biographers. The focus of his work was the Military Historical Society of Massachusetts, which he founded in 1876. The work of this society was the collection and discussion of evidence relating to the great conflict. Although practically every member of this society except himself had fought through the war, and many, such as Hancock and W. F. Smith, were general officers of great distinction, it was from first to last maintained and guided by Ropes, who presented to it his military library and his collection of prints and medals. He died at Boston on the 23rd of October 1890. His principal work is an unfinished Story of the Civil War, to which he devoted most of his later years; this covers the years 1861–62. The Army under Pope is a detailed narration of the Virginia campaign of August–September 1862, which played a great part in reversing contemporary judgment on the events of those operations, notably as regards the unjustly-condemned General Fitz John Porter. Outside America, Ropes is known chiefly as the author of The Campaign of Waterloo, which is one of the standard works on the subject.

The greater part of his studies of the Civil War appears in the Military Historical Society's publications. Papers on the Waterloo campaign appeared in the Atlantic Monthly of June 1881, and in Scribner's Magazine and April 1888. Amongst his miscellaneous works is a paper on "The Likenesses of Julius Caesar" in Scribner's Magazine (February 1887). See Memoir of John Codman Ropes (Boston, privately printed, 1901).

ROPE-WALKING, the art of walking, dancing and performing tricks of equilibrium on a rope or wire stretched between two supports. It has been popular with most Asiatic and European peoples from the beginning of history. Before the middle of the 19th century a rope was invariably used, and was stretched as tightly as possible, on which account the art was called Tight-rope Walking. About the year 1875 the slack wire, stretched loosely from support to support, was introduced, and is now more commonly used. The performer is often aided in keeping his balance by a Chinese umbrella or a long pole.

ROPS, FÉLICIEN (1833-1868), Belgian painter, designer and engraver, was born at Namur, in Belgium, on the 7th of July 1835; he spent his childhood in that town, and afterwards in Brussels, where he composed in 1850, for his friends at the university, the Almanack of the University. He also brought out two Salons Illustrés, and collaborated on the Crocodile, a magazine produced by the students. The humour shown in his contributions attracted the attention of publishers, who offered him work. He designed, among other things, frontispieces for Poulet-Malassis, and afterwards for Gay and Doucé. In 1850 he began to contribute to a satirical journal in Brussels called Ulyssespigel, a sort of Charivari. The issue, limited unfortunately to two years, included his finest lithographs. About 1862 he went to Paris and worked at Jacquemart's. He subsequently returned to Brussels, where he founded the short-lived International Society of Etchers. In 1865 he brought out his famous "Buveuse d'Absinthe," which placed him in the foremost rank of Belgian engravers; and in 1871 the "Dame au Pantin." After 1874 Rops resided in Paris. His talent, which commanded attention by its novel methods of expression, and had been stimulated by travels in Hungary, Holland and Norway, whence he brought back characteristic sketches, now took a soaring flight. To say nothing of the six hundred original engravings enumerated in Ramiro's Catalogue of Rops' Engraved Works (Paris, Conquet, 1887), and one hundred and eighty from lithographs (Ramiro's Catalogue of Rops' Lithographs, Paris, Conquet, 1891), besides a large number of oil-paintings in the manner of Courbet, and of pencil or pen-and-ink drawings, he executed several very remarkable water-colour pictures, among which are "Le Scandal," 1876; "Une Attrappe," 1877 (now in the Brussels Museum); a "Tentation de Saint Antoine," 1878; and "Pomnocrates," 1878. Most of these have been engraved and printed in colours by Bertrand. From 1880 to 1890 he devoted himself principally to illustrating books: Les Rimes de Jofe, by Théophile Hannon; Le Vice suprême et Curieux, by J. Péladan; and Les Dialogues, by Barby d'Auréliaville; L'Amant du Christ, by R. Darzens; and Zadig, by Voltaire; and the poems of Stéphane Mallarmé have frontispieces due to his fertile and powerful imagination. Before this he had illustrated the Légendes Flamandes, by Ch. Decoster; Jene France, by Th. Gautier;
and brought out a volume of *Cent Croquis pour réjouir les Honnêtes Gens*. His last piece of work, an advertisement of an exhibition, was done in November 1896. Rops died on the 23rd of August 1896, at Éssonnes, Seine-et-Oise, on the estate he had purchased, where he lived in complete retirement with his family. Scorning display, Rops almost always opposed any exhibition of his works. However, he consented to join the Art Society of the “XX.”, formed at Brussels in 1884, as their revolutionary views were in harmony with the independence of his spirit. After his death, in 1899, the Libre Esthétique, which in 1894 had succeeded the “XX.”, arranged a retrospective exhibition, which included about fifty paintings and drawings by Rops. Rops was a Chevalier of the Legion of Honour. He excelled in these three methods of artistic expression; but his engraved work is the most important, both as to mastery of technique and originality of ideas, though in all his talent was exceedingly versatile. Hardly any artist of the 19th century equalled him in the use of the dry-point and soft varnish. By his assured handling and admirable draughtsmanship, particularly of his sometimes wildly fantastic conceptions, he made his place among the great artists of his time. “Giving his figures a character of grace which never lapses into limppness,” says his biographer, E. Ramiro, “he has analysed and perpetuated the human form in all the elegance and development impressed on it by modern civilization.”

In 1896 *La Plume* (Paris) devoted a special number to this artist, fully illustrated, by which the public were made aware how many of his works are unsuitable for display in the drawing-room or boudoir. E. Deman, the publisher at Brussels, brought out a volume in 1897 with the title, *Félicien Rops et son œuvre*—papers by various writers. We may also mention a study of *Félicien Rops*, by Eugène Demolder (Paris, Princebourde, 1894), and another by the same writer in *Trois Contemporains* (E. Deman, 1901); *Les Repiagnes*, by Pierre Gaumé, throughout out in London, 1898; and the admirable notice by T. K. Huysmans in his volume called *Certains*. (O. M.*

**ROQUELAURE**, a title derived from a small commune in France (dep. of Gers), and borne by a French family of Armagnac, one member of which was Antoine, baron de Roquelaure (1544-1625), who was in the service of Henry IV. before he became king, and after his accession was made master of the wardrobe, lieutenant-general in Auvergne (1576) and Guienne (1610), and marshal of France in 1614. His son, Gaston Jean Baptiste de Roquelaure (1617-1633), a celebrated wit, was created duke and peer of France in 1632, and was appointed governor of Guienne in 1679. Gaston’s son, Antoine Gaston Jean Baptiste de Roquelaure (1656-1738), carried on the family reputation for wit, and, in spite of his military incapacity, received the marshal’s báton in 1724.

**RORQUAL**, a whale of a long and elongated shape, with a small back-fin and a number of longitudinal pleatings or folds on the throat (see CETACEA). The name rorqual refers to these folds, while the alternative title of finner, or fin-whale, marks an important difference between these whales (for there are several species) and right-whales. The furrows on the throat are numerous and close-set, the flipper is comparatively small, and the dorsal fin distinct. The head is relatively small, flat and pointed in front, the whalebone is short and coarse, the body long and slender, and the tail much compressed before it expands into the “flukes.” Rorquals are the most abundant and widely distributed of all whales, being found in all seas, except the extreme Arctic and Antarctic regions. There are four distinct species of this genus in British seas. Firstly, Sibbald’s rorqual, or blue whale (Balaenoptera sibbaldii), the largest of all animals, attaining a length of 80 or even sometimes 85 ft. Its colour is dark bluish grey, with small whitish spots on the breast; the whalebone is black; the flippers are larger proportionally than in other rorquals, measuring one-seventh of the total length of the body; and the dorsal fin is small and placed far back. This whale has usually 64 vertebrae, of which 16 bear ribs. Like the others, this species seems to pass the winter in the open seas, and approaches the coast of Norway at the end of April or beginning of May. At this time its sole food is a small crustacean (*EnhydrinaNotaris*), which swarms in the fjords. Secondly, we have the common rorqual (*B. musculus*, or *B. physalus*) with a length of from 65 ft. to 70 ft., and of a greyish slate-colour above and white underneath, and the whalebone slate-colour, variegated with yellow or brown. It has usually 62 vertebrae, of which 15 bear ribs. This is the commonest of all the large whales on the British coasts; scarcely a winter passing without the body of one being washed ashore, usually after stormy weather, and frequently on the south coast, as this species has a more southern range than the last, and enters the Mediterranean. It feeds largely on fish, and is frequently seen feasting among shoals of herrings. Thirdly comes Rudolph’s rorqual (*B. borealis*), a smaller species, scarcely attaining a length of 50 ft. It is bluish black above, with oblong light-coloured spots, whilst the under-parts are more or less white; the whole of the tail and both sides of the flippers are black; the whalebone is black, and the bristly ends fine, curling and white; the flippers are very small, measuring one-twelfth of the total length of the body. There are 56 vertebrae, with 14 pairs of ribs. This species, according to Dr. C. Collett, feeds chiefly on minute crustaceans, mainly *Calanus finmarchicus* and *Enhydrina Notaris*, and not on fish. Down to the last quarter of the 19th century it was considered the rarest of the whales of European seas, and was only known from a few individuals stranded on the coasts of northern Europe at long intervals. The most southern point at which it has been met with is Biarritz. Since the establishment of the whaling station near the North Cape it has been shown to be a regular summer visitor. Lastly, the lesser rorqual, *B. rostralis*, the sharp-nosed finner of American whalers, is the smallest species found in all seas, rarely exceeding 30 ft. in length. Its colour is greyish black above and white underneath, including the whole of the lower side of the tail; the inside of the flippers is also white, and there is a broad white band across the outer side, which is a very characteristic mark of the species; the whalebone is yellowish white. The dorsal fin in this and the preceding species is comparatively high, and placed far forwards on the body. This whale has usually 48 vertebrae, of which 11 bear ribs. It is common in summer in the fjords of Norway, and is often seen around the British Isles. It has been taken, though rarely, in the Mediterranean, and ranges as far north as Davis Strait.

Rorquals are met with in almost all seas, and nearly all the individuals carefully examined, whether from the North Pacific, the Australian seas or the Indian Ocean, come very near in structure to one or the other of the Atlantic forms described above, so much so that some zoologists believe that there are but four species, with an almost cosmopolitan range. Other naturalists, on the contrary, have described and named almost every individual specimen captured as belonging to a different species. See WHALE and HUMP-BACK WHALE. (R. L.*

**RORSCHACH**, a busy commercial town in the Swiss canton of St Gall, situated on the south-west shore of the Lake of Constance, and by rail 62 m. N.E. of Zürich, 10 m. S.E. of Romanshorn and 57 m. N. of Coire. In 1900 its population was 9140, mostly German-speaking, while there were 5935 Romanists to 3130 Protestants. From 1408 to 1798 it belonged to the abbot of St Gall, and then to the canton Säntis (named canton of St Gall in 1803) of the Helvetic Republic. It has always been a great commercial centre, though now superseded by Romanshorn as regards the corn trade. It has many industrial establishments, of which the chief is one for the manufacture of lace and...
muslin. Above the town is the old convent of Mariaber, originally built in the 15th century as a refuge for the monks of St Gall against the turbulent citizens of that town, but now a seminary for teachers. From Rorschach a cogwheel railway runs south-east in 42 m. up to Heiden, a village in the canton of Appenzell well known for its goats' whey cheese. (W. A. B. C.)

**ROS**, or **De Ros**, the name of a noble English family. Robert de Ros (d. 1227), a son of Everard de Ros (d. 1191) of Helmsley, or Hamlake, in Yorkshire, possessed lands in Yorkshire, including Ros, or Ros, in Holderness, and also in Normandy. He served King John in several ways, both in England and abroad, and obtained lands in Northumberland, where he built a castle at Wark, or Werke. About 1215, however, he deserted the king and became one of the leaders of the baronial party, being one of the twenty-five executors of Magna Carta and fighting against John when he repudiated this engagement. He submitted to Henry III. and became a monk before he died in 1227. His wife was Isabella, daughter of William the Lion, king of Scotland, by whom he had two sons, William and Robert. Robert de Ros the younger (d. 1274), was an itinerant justice under Henry III., but later he was one of the barons who fought against this king. He passed much of his time, however, in Scotland, where he held a barony and where he was one of the guardians of Margaret, the English bride of King Alexander III. His son Robert was summoned to parliament as Lord Ros de Werke in 1295; just afterwards he revolted against Edward I. and his lands were forfeited. William de Ros (d. 1258), the elder son of the executor of Magna Carta, had a son Robert (d. 1283), who was summoned to parliament as a baron by Simon de Montfort in 1264; he was also summoned to parliament by Edward I. His son William, 2nd baron Ros of Helmsley, or Hamlake (d. 1317), obtained Belvoir Castle in Leicestershire through his mother Isabel, daughter of William d'Albini. He was one of the minor claimants for the crown of Scotland in 1292, and soon afterwards he obtained the lands in Northumberland which had been taken from his traitorous cousin Robert de Ros. His second son, John de Ros (d. 1318), was a courtier under Edward II. Later he joined Edward's queen, Isabella, was summoned to parliament by Edward III., and distinguished himself on the sea. Another John de Ros (d. 1332), bishop of Carlisle from 1325 to 1332, was doubtless a member of this family.

The second baron's descendants retained the barony of Ros until the death of Edmund de Ros, 11th baron, in October 1508. Edmund's nephew Sir George Manners (d. 1513), of Belvoir and Helmsley, then claimed it, and was called Lord Ros, or Roos. His son, Thomas Manners, the 13th baron (d. 1543), was created earl of Rutland in 1525, but the barony was separated from the earldom when Thomas's grandson Edward died in 1567, leaving an only child, Elizabeth (d. 1591), who, as heir general of the family, became Baroness Ros, or Roos. Elizabeth married into the Cecil family, and when her only child, William Cecil, died in 1618, the barony reverted to the Manners family. Francis Manners, another of the earl of Rutland's (1575-1622) sons, was created 1st Viscount Knebworth in 1611. On his death the barony again passed to a female, his daughter Katherine, through whom it came to the family of Villiers. Then in 1686, after a long abeyance, Charlotte (1670-1831), daughter of the Hon. Robert Boyle, and a descendant of the Manners family, was declared Baroness Ros, or Roos. She married Lord Henry Fitzgerald, and their son, Henry William Fitzgerald-de-Ros (1793-1839), became the 22nd baron on his mother's death. In 1907, on her father's death, Mary Frances, wife of the Hon. Anthony Dawson, became Baroness Ros, or rather, De Ros, which is the present form of the title. For a long time after they had ceased to hold the barony the earls and dukes of Rutland continued to style themselves Lords Roos.

**ROS, SIR RICHARD** (b. 1420), English poet, son of Sir Thomas Ros, lord of Hamlake (Helmsley) in Yorkshire and of Belvoir in Leicestershire, was born on the 8th of March 1420. In Harl. MS. 372 the poem of "La Belle Dame sans Mercy," first printed in W. Thynne's Chaucer (1532), has the ascription "Translatid out of Frenche by Sir Richard Ros." "La Belle Dame sans Mercy" is a long and rather dull poem from the French of Alain Chartier, and dates from about the middle of the 15th century. It is written in the Midland dialect, and is surprisingly modern in diction. The opening lines—

"Half in a dreme, not fully well awaked,

The golden sleep me wrapped under his wing."

have often been quoted, but the dialogue between the very long-suffering lover and the cruel lady does not maintain this high level.

See W. S. Skeat, Chaucerian and Other Pieces (1897); and Dr. H. Grobler, Ueber Richard Ros' mittelenglische Uebersetzungen . . . (Dresden, 1886).

**ROSA, CARL AUGUST NICHOLAS** (1843-1889), English musical impresario, was born at Hamburg, his family name (which he subsequently changed) being Rose. He started as a solo violinist, studying at Leipzig and Paris, and also had considerable success as a conductor both in England and America; and it was at New York in 1867 that he met and married the famous operatic soprano Madame Parepa (1836-1874), whose death he afterwards endowed with a Parepa-Rosa scholarship at the Royal Academy of Music in London. In 1875 he started the Carl Rosa Opera Company, for producing the best operas in English versions, and both during his own life and after his death this company had much to do with popularizing good music in England, encouraging native composers and training a number of excellent singers. Carl Rosa married a second time in 1881, and died in Paris on the 30th of April 1889.

**ROSA, MONTE**, the name of a great glacier-clad mountain mass (the name comes from the Aostan patois word roés, meaning a glacier) which rises S.E. of Zermatt, and on the frontier between Switzerland (canton of the Valais) and Italy. Ten summits in this huge mass are distinguished by name, of which four (the Nordend, 15,132 ft., the Zumsteinspitze, 15,004 ft., the Signalkuppe or Punta Gnifetti, 14,605 ft., and the Parrotspitze, 14,645 ft.) rise on the frontier. The five lower summits are on the Italian side, but the highest of all, the Dufourspitze, 15,217 ft. (so named by the Swiss government in honour of General Dufour, the head of the great survey which first accurately fixed the position of these points), rises W. of the frontier ridge, on a buttress, and is thus entirely in Switzerland, of which it is the culminating peak (and not, as often stated, the Dom, 14,942 ft., in the Mischabel group). The loftiest point of the Dufourspitze was first attained in 1855 by a large English party, which included Messrs G. and C. Smyth, C. Hudson, Birbeck and Stevenson. The Zumsteinspitze was first climbed in 1820, the Signalkuppe (on top of which there is now a club hut) in 1842, the Nordend in 1861 and the Parrotspitze in 1863. The ascent of all the points named is not difficult from the Swiss side, but excessively dangerous on the east or Italian side. (W. A. B. C.)

**ROSA, SALVATOR** (1615-1673), Italian painter of the Neapolitan school, was born in Arenella, in the outskirt of Naples, on 16th June; the day of his birth is given as the 20th of June, and also as the 21st of July. His father, Vito Antonio de Rosa, a land surveyor, was bent upon making the youth a lawyer, or else a priest, and sent him to study in the convent of the Somaschi fathers. Here Salvator began showing a turn for art: he went in secret to his maternal uncle Paolo Greco to learn the practice of painting, but soon found that Greco had little pictorial lore to impart, so he transferred himself to his own brother-in-law Francesco Francanzaro, a pupil of Ribera, and afterwards had some practice under Ribera himself. Above all he went to nature, frequenting the Neapolitan coast, and keeping his eyes open and his hand busy. At the age of seventeen he lost his father; the widow was left unprovided for, with at least five children, and Salvator found himself immersed in a sea of troubles and perplexities, with nothing for the while to stem them except a buoyant and adventurous temperament. He obtained some instruction under the battle-painter Antonio Falcone, but chiefly painted in solitude, haunting romantic
and desolate spots, beaches, mountains, caverns, verdure-clad recesses. Hence he became in process of time the initiator of romantic landscape, with a special turn for scenes of strange or picturesque aspect—often turbulent and rugged, at times grand, and with suggestions of the sublime. He picked up scanty doles when he could get them, and his early landscapes sold for a few pence to petty dealers. The first person to discover that Rosa's work was not as trumpery as it was cheap was the painter Lanfranco, who bought some of the paintings, and advised the youth to go to Rome. Hither in 1635, at the age of twenty, Rosa betook himself; he studied with enthusiasm, but, catching fever, he returned to Naples and Falcone, and for a while painted nothing but battlepieces, and these without exciting any attention. This class of work was succeeded by the landscape art peculiarly characteristic of him—wild scenes wildly peopled with shepherds, seamen or soldiers. He then revisited Rome, and was housed by Cardinal Brancaccio; this prelate being made bishop of Viterbo, Rosa painted for the Chiesa della Morte a large and noticeable picture of the "Incredibility of Thomas"—the first work of sacred art which we find recorded from his hand. A few years later he married a woman named Abati, and was hence inclined to try his own faculty in verse. He then returned to Naples. Here the monopolizing triumvirate—Ribera, Caracciolo and Corenzio—were still powerful. Rosa was as yet too obscure to suffer from their machinations; but, having painted a picture of "Titus Torn by the Vulture," which went to Rome and there produced a great sensation, he found it politic to follow in the footsteps of his fame, and once more, in 1638, resought the papal city.

Rosa was a man of facile and versatile genius, and had by this time several strings to his bow. It is said that, still keeping painting steadily in view as his real objective, he resolved to secure attention first as a musician, poet, improvisatore and actor—his mother-wit and broad Neapolitan dialect (which appears to have stuck to him through life) standing him powerfully in stead. In the carnival he masqued as Formica and Capitan Coviello, and bustled about Rome distributing satirical prescriptions for diseases of the body and more particularly of the mind. As Formica he inveighed against the farcical comedies acted in the Trastevere under the direction of the celebrated Bernini. Some of the actors, in one of their performances, retaliated by insulting Rosa, but the public was with him, and he now enjoyed every form of success—social prestige, abundant commissions and any amount of money, which he was wont to throw about broadcast to the populace. In 1646 he returned to Naples, and is said to have taken an active part in the insurrection of Masaniello; certain it is that he sympathized with and admired the fisherman autocrat, for a passage in one of his satires proves this. His actual share in the insurrection is, however, dubious; it appears only in recent narratives, and the same is the case with the well-known story that at one time he herded with a band of brigands in the Abruzzi—an incident which cannot be conveniently dove-tailed into any of the known dates of his career. As regards the popular revolt against Spanish tyranny, it is alleged that Rosa, along with other painters—Coppola, Porpora, Domenico Gariglido, Dal Po, Masturzo, the two Vaccari and Caglione—all under the captaincy of Aniello Falcone, formed a Compagnia della Morte, whose mission it was to hunt up Spaniards in the streets and despatch them, not sparing even those who had sought some place of religious asylum. He painted a portrait of Masaniello—probably from reminiscence rather than from life: indeed, it is said that he painted him several times over in less than life size. On the approach of Don John of Austria the blood-stained Compagnia dispersed, Rosa escaping or at any rate returning to Rome. Here he painted some important subjects, showing the uncommon bent of his mind as it passed from landscape into history—"Democritus amid Tombs," the "Death of Socrates," "Regulus in the Spiked Cask" (these two are now in England), "Justice Quelling the Earth," and the "Wheel of Fortune." This last work, the tendency of which was blisteringly satirical, raised a storm of ire and remonstrance, Rosa, endeavouring at conciliation, published a description of its meaning (probably softened down not a little from the real facts); none the less an order for his imprisonment was issued, but ultimately withheld at the instance of some powerful friends. It was about this time that Rosa wrote his satire named Babylon, under which name Rome was of course indicated.

Cardinal Giancarlo de' Medici now invited the painter to leave Rome—which had indeed become too hot to hold him for Florence. Savior gladly assented, and remained in the Tuscan capital for the better part of nine years, introducing there the new style of landscape; he had no pupils, but various imitators. Lorenzo Lippi the painter poet, and other beaux esprits shared with Rosa the hospitality of the cardinal, and they formed an academy named I Percossi (the Stricken), indulging in a deal of ingenious jollity—Rosa being alike applauded as painter, poet and musician. His chief intimate at this time was Lippi, whom he encouraged to proceed with the poem Il Malmantile Ruscisato. He was well acquainted also with Ugo and Giulio Maffei, and housed with them more than once in Volterra, where he wrote other four satires—Maligni Fortunati. At the same time he painted his own portrait, now in the Uffizi Gallery of Florence. Finally he reverted once more to Rome, and hardly left that city again. Much enmity still brooded there against him, taking the form more especially of an allegation that the satires which he zealously read and diffused in MS. were not his own production, but filched from some one else. Rosa indignantly repelled this charge, which remains indeed quite unsubstantiated, although it is true that the satires deal so extensively and with such ready manipulation in classical names, allusions and anecdotes, that one is rather at a loss to fix upon the period of his busy career at which Rosa could possibly have imbibed his mind with such a multitude of semi-erudite details. It may perhaps be legitimate to suppose that his literary friends in Florence and Volterra had coached him up to a large extent—the satires, as compositions, remaining none the less strictly and fully his own. To confute his detractors he now wrote the last of the series, entitled Envy. Among the pictures of his remaining years were the admired "Battlepiece" now in the Louvre, painted in the short space of forty days, full of long-drawn carnage, with ships burning in the offing; "Pythagoras and the Fishermen;" the "Oath of Catiline" (Pitti Gallery); and the very celebrated "Saul and the Witch of Endor" (Louvre), which is almost his latest work. He undertook a series of satirical portraits, to be closed by one of himself; but while occupied with this project he was assailed by dropsy, which, after lasting fully half a year, brought his life to a close on the 15th of March 1673. In his last moments he married a Florentine named Lucrezia, who kept his house and had borne him two sons, one of them surviving him, and he died in a constraint frame of mind. He lies buried in the Chiesa degli Angeli, where a portrait of him has been set up. Savior Rosa, after the hard struggles of his early youth, had always been a successful man, and he left a handsome fortune.

Rosa was indisputably a great leader in that modern tendency of fine art towards the romantic and picturesque which, developing in various directions and by diverse processes, has at last most totally differentiated modern from olden art. He saw appearances with a new eye, and presented new images of them on his canvases, and deserves therefore all the credit due to a vigorous innovator who adhered strongly to the principles of his own time. His self-sufficing reputation for his historical works, laying comparatively little stress on his landscapes; in portraits he was forcible. In chiaroscuro he is simple and effective; his design has energy and reserve, his surfaces high-bred and delicate, his touch full for measure of correctness. His colour is too constantly of a sandy or yellowish-grey tone. Personally he was a man of high spirit, and he sold his pictures at large prices, more (it is said) to assert the honour of his art than to make much real profit. A famous rascal, he destroyed them. In his later Florentine period he etched several of his works, subjects of mythology, soldiering, &c. He was choleric, but kind and generous. Though a man of gaiety and pleasure, and a jovial boon companion, he does not appear to have been vicious in any serious degree. He was talkative, very sharp-tongued and an unblushing encomiast of his own performances. Among his pictures not already mentioned we may name, in the National
ROSACEAE

Gallery, London, "Mercury and the Dishonest Woodman," and three others; in Raynham Hall, "Belisarius;" in the Grosvenor Gallery, "Diogenes;" in the Pitti Gallery, a grand portrait of a man in armour, and in the Temptation of St Anthony, which contains his own portrait. The subject appears also in St Peters, and in the Berlin Gallery.

The satires of Salvator Rosa deserve more attention than they have generally received. There are, however, two recent books taking a fresh view of Cimabue, de' Cavalieri, and the Bellini. The satires, though considerably spread abroad during his lifetime, were not published until 1719. They are all in terza rima, written without much literary correctness, but remarkably spirited, pointed and effective. Those which are dated 1649 are the earliest, and this point of view too monotonous in treatment. Rosa here appears as a very severe castigator of all ranks and conditions of men, not sparing the highest, and as a champion of the poor and down-trodden, and in which he holds fast his traditions. The satires, though a mask, who took so free a part in the pleasures and diversions of life should be so ruthless to the ministers of these. The satire on Music exposes the insolence and profanity of painters, and the shame of courts and churches in encouraging them. Poetry dwells on the pedantry, immitativeness, adulation, affectation and indecency of poets—also their poverty, and the neglect with which they were treated; and there is a very clever satire on the aristocrats. Tasso's story is upheld; Dante is spoken of as obsolete, and Ariosto as corrupting. Painting inveighs against the pictorial treatment of squalid subjects, such as beggars (though Rosa must say himself have been partly responsible for this misdirection of the art), against the ignorance and lewdness of painters, and their tricks of trade, and the gross violation of painting spruaking half-naked saints of both sexes. War (which contains the Eulogy of Masaniello) describes the folly of hireling soldiers, who fight and perish while kings stay at home; the vile morals of kings and lords, heresy and unbelief in the Pope, are in a large measure exposed by Babylonia Rosa represents himself as a fisherman, Tirreno, constantly unlucky in his net-hauls on the Euphrates; he converses with a native of the country, Ergastolo. Babylon (Rosaceae) is a treatise much the same. Envy (the last of the satires, and generally accounted the best, although without strong apparent reason) represents Rosa dreaming that, as he is about to inscribe in all modesty his name upon the altar of the temple of glory, the goddess or fiend of Envy obstructs him, and a long interchange of reciprocal objections ensues. Here occurs the highly charged portrait of the chief Roman detractor of Salvator (we are not aware that he has ever been identified by name); and the painter protests that he would never descend to do any of the lascivious work in painting so shamefully in vogue.

As authorities for the life of Salvator Rosa, Passeri, Vie de d'Artis, Larive, and Savait, Satire et Vie de Salvator Rosa; also Baldinucci and Dominici. The Life by Lady Morgan is a romantic treatment, mingling tradition or mere fiction with fact. The novel, A Company of Death, by Albert Cotton, 1664, gives an interesting picture of Salvator Rosa at Naples. (W. M. R.)

ROSACEAE, in botany, a large cosmopolitan family of seed-bearing plants belonging to the subclass Polyetae of Dicotyledons and containing about 90 genera with 3000 species. The plants vary widely in manner of growth. Many are herbaceous, growing erect, as Geum, or with slender creeping stem, as in species of Potentilla, sometimes sending out long runners, as in strawberry; others are shrubby, as raspberry, often associated with a scrambling habit, as in the brambles and roses, while apple, cherry, pear, plum and other British fruit trees represent the arborescent habit. Vegetative propagation takes place by means of runners, which root at the apex and form a new plant, as in strawberry; by suckers springing from the base of the shoot and rising to form new leafy shoots after running for some distance beneath the soil, as in raspberry; or by shoots produced from the roots, as in cherry or plum. The scrambling of the brambles and roses is effected by means of prickles on the branches and leaf-stalks.

The leaves, which are arranged alternately, are simple, as in apple, cherry, &c., but more often compound, with leaflets palmately arranged, as in strawberry and species of Potentilla, or pinnately as in the brambles. Rose, mountain ash, &c. A difference in this respect occurs in one and the same genus, as in Pyrus, where apple (P. Malus), and pear (P. communis) have simple leaves, whereas mountain ash or rowan (P. aucuparia) has pinnately compound leaves. In warm climates the leaves are often leathery and evergreen. The leaves are stipulate, the stipules being sometimes small and shortlived, as in Pyrus and Prunus (cherry, plum, &c.), or more important structures adnate to the base of the leaf-stalk, as in roses, brambles, &c. The flowers, which are regular, generally bisexual, and often showy, are sometimes borne singly, as in some species of rose, or of the cloudberry (Rubus chamaemorus), or few or more together in a corystome manner, as in some roses, hawthorn and others. The inflorescence in agrimony is a raceme, in Poterium a dense-flowered spike, in Spiraea a number of cymes arranged in a corymb. The parts of the flowers are arranged on a 5-merous plan, with generally considerable increase in the number of stamens and carpels. The shape of the thalamus or floral receptacle, and the relative position and number of the stamens and carpels and the character of the fruit, vary widely and form distinguishing features of the different suborders, six of which may be recognized.

Suborder I. Spiraeoideae is characterized by a flat or slightly convex receptacle on which the carpels, frequently five in number, form a central whorl; each ovary contains several ovules, and the fruit is a follicle. There are five sepals, five petals and the stamens vary from ten to indefinite. The plants are generally shrubs or trees with simple or compound leaves and racemes or panicles of numerous small white, rose or purple flowers. This suborder, which is nearly allied to the order Saxifragaceae, contains 17 genera, chiefly north temperate in distribution. The largest is Spiraea, numerous species of which are cultivated in gardens; S. uva-crispa occurs in Britain apparently wild in plantations, but is not indigenous. The native British meadow-sweet (S. ulmaria) and dropwort (S. fulgens) have been placed in a separate genus, Ulmus, and included in the Rosoideae on account of their differentiated fruit. Quillaja saponaria is the Chilean soap tree; the bark contains saponin.

Suborder II. Pomoideae is characterized by a deep cup-shaped receptacle with the inner wall of which the five or fewer carpels are united (fig. 1, 1): the carpels are also united with each other, and each contains generally two ovules. The fruit is made up of the large fleshy receptacle surrounding the ripe ovaries, the endocarp of which is leathery or stony and contains one seed. The plants are shrubs or trees with simple or pinnately compound leaves and white or rose-coloured often showy flowers, with five sepals and petals and indefinite stamens. The 14 genera are distributed through the temperate zones of both hemispheres and many are native to the Andes of Peru and Chile. The largest genus, Pyrus, with about 50 species, includes apple (P. Malus), pear (P. communis) (fig. 2), wild service (P. terrinalis), rowan or mountain-ash (P. aucuparia), and white beam (P. Aria). Malus (mollydum) and Malus domestica are also included. (See separate articles for most of the above).

Suborder III. Rosoideae is characterized by the receptacle being convex and swollen (fig. 1, 1), as in strawberry, or cup-shaped, as in rose (fig. 4), and bearing numerous carpels, each of which contains one or two ovules, while the fruit is one-seeded and indescent. The 39 genera are grouped in tribes according to the form of the receptacle and of the fruit. The Potentillae bear the carpels on a large, rounded or convex outgrowth of the receptacle. In the large genus Rubus (fig. 3) the ripe ovaries form drupel upon the dry receptacle; the genus is almost cosmopolitan, but the majority of species occur in the forest region of the north temperate zone and in the mountains of tropical America. F. fruticosus is blackberry, F. Idaea, raspberry, and F. Chamaemorus, cloudberry. In the flower of Potentilla, Fragaria (strawberry) and a few allied genera an epicalyx is formed by stipular structures arising at the base of the sepals. The fruits consist of numerous dry achenes borne in Fragaria, the much-enlarged...
succulent torus, which in the other genera is dry. In *Gevum* (avens) and *Dryas* (an arctic and alpine genus) the style is persistent in the

fruit. Forming a feathery appendage (*Dryas*) or a barbed awn (avens), either of which is of service in distributing the fruit. The Potentillaee are chiefly north temperate, arctic and alpine plants.

The Roseae comprise the large genus *Rosa*, characterized by a more or less urn-shaped torus (fig. 4) enclosing the numerous carpels which form dry one-seeded fruits enveloped in the brightly coloured fleshy torus. The numerous stamens surround the mouth of the torus. The plants are shrubs bearing prickles on the stems and leaves; many species have a scrambling habit resembling the brambles. The species of *Rosa*, like those of *Rubus*, are extremely variable, and a great number of subspecies, varieties and forms have been described. The Sanguisorbeae are a reduced form of Rosoideae. The dry one-seeded fruit is enclosed in the urn-shaped torus, which, however, is dry and inconspicuous, and the number of carpels is much reduced, sometimes to one (figs. 2, 5, 6). Petals are often wanting, as in *Alchemilla* (lady's mantle) and *Potentilla*, and the flowers are often unisexual and frequently wind-pollinated, as in *Saturnia Sanguisorba*), where the small flowers are crowded in heads, the upper pistillate, with protruding feathery stigmas, and the lower staminate (or bisexual), with exserted stamens. *Agrimonia* (agrimony) has a long spike of small honeysuckle flowers with yellow petals; in the fruit the torus becomes hard and crowned by hooked bristles which ensure the distribution of the enclosed achenes. 

Suborder IV. Neurodetteae contains only two genera of desert-inhabiting herbs with yellow flowers; and the five to ten carpels are united together and with the base of the cup-shaped torus, which enlarges to form a dry covering round the one-seeded fruit.

Suborder V. Prunoideae (fig. 7) is characterized by a free solitary carpel with a terminal style and two pendulous ovules, and the fruit a one-seeded drupe. The torus forms a cup from the edge of which spring the five sepals, five alternating petals and the ten to indefinite stamens. The plants are deciduous or evergreen trees or shrubs with simple leaves, often with small caducous stipules, and racemes or umbels of generally showy, white or pink flowers. There are five genera, the chief of which is *Prunus*, to which belong the plum (*Prunus communis*), with several well-marked subspecies—*P. spinosa* (aloe or blackthorn), *P. insititia* (bullace), *P. domestica* (wild plum), the almond (*P. Amygdalus*), with the nearly allied peach (*P. persica*), cherry (*P. Cerasus*), birdcherry (*P. Padus*) and cherry laurel (*P. Laurocerasus*). The tribe is distributed through the north temperate zone, passing into the tropics.

ROSAMOND, known as "The Fair" (d. c. 1376), mistress of Henry II., King of England, is believed to have been the daughter of Walter de Clifford of the family of Fitz-Ponce. The evidence for the paternity is, however, only an entry of a statement made by the jurors of the manor of Corham in a Hundred Roll of the second year of the reign of Edward I. (1274), great grandson of Henry II. Rosamond is said to have been Henry's mistress secretly for several years, but was openly acknowledged by him only when he imprisoned his wife Eleanor of Acquitaine as a punishment for her encouragement of her sons in the rebellion of 1217-74. She died in or about 1276, and was buried in the nunneries of Godstow before the high altar. The body was removed by order of St Hugh, bishop of Lincoln, in 1191, and was, seemingly, reinterred in the chapter house. The story that she was poisoned by Queen Eleanor first appears in the French Chronicle of London in the 14th century. The romantic details of the basin at Woodstock, and the clue which guided King Henry II. to her by night, were the inventions of story-writers of later times. There is no evidence for the belief that she was the mother of Henry's natural son William Longsword, earl of Salisbury.

ROSARIO, a city and river port of Argentina, in the province of Santa Fé, on the W. bank of the Paraná, 186 m. by rail N.W. of Buenos Aires. Pop. (1904, estimate) 120,000. It is accessible to ocean-going steamers of medium draught. The city stands on the eastern margin of the great pampean plain, 65 to 75 ft. above the wide river-bed washed out by the Paraná. It extends back a considerable distance from the river, and there are country residences and gardens of the better class along the line of the Central Argentine railway and northward toward San Lorenzo. The city is laid out with chessboard regularity, and the streets are paved (in great part with cobblestones), lighted with gas and electricity, traversed by tramway lines, and provided with sewers and water mains. The Boulevard of the Rosary is an attractive residence street, double driveways separated by a strip of garden and bordered by fine shade trees. The chief edifices of an official character are the custom house, post office, municipal hall and law courts. There is a large charity hospital, and the English and German colonies maintain a well-equipped infirmary. The largest sugar refinery in Argentina is here, and there are flour-mills, breweries and some smaller manufactures. The city is chiefly commercial, being the shipping port for a large part of northern Argentina, among its exports being wheat, flour, baled hay, linseed, Indian corn, sugar, rum, cattle, hides, meats, wool, quebracho extract, &c. The railway connexions are good, including the Buenos Aires and Rosario and the Central Argentine lines to the national capital, the Buenos Aires and Rosario line northward to Tucuman, where it connects with the government line to Salta, Jujuy and the Bolivian frontier, the Central Argentine line westward to Cordoba, with connections at Villa Maria for Mendoza and the Chilen frontier, and two narrow-gauge lines, one running to Santa Fé and the other to Cordoba. The port of Rosario has by hitherto consisted of a deep river for the accommodation of steamers. Since 1902 work has been in progress under a contract with a French company for the construction of 12,697 ft. of quays, 23 m. of railway tracks along the quays to connect with the several railways entering the city, drawbridges, roadways, sheds, depots, elevator, offices, electric plant, fixed and movable cranes, and other appliances, &c., for the handling of produce and merchandise. The trade of the port was officially valued at 21,276,272 Arg. gold dollars imports, and 68,503,237 gold dollars exports in 1905.

Rosario was founded in 1730 by Francisco Godoy, but it grew so slowly that it was still a small village up to the middle of the 19th century. In 1854 General Justo José de Urquiza, then at the head of the Argentine Confederation, made it the port of the ten inland provinces then at war with Buenos Aires, and in 1857 imposed differential duties on the cargoes of vessels first breaking bulk at the southern port. This gave Rosario a start, and its trade and population have grown since then with great rapidity.

ROSARY (Lat. rosarium), a popular devotion of the Roman Catholic Church, consisting of 15 Paternosters and Glorias and 150 Aves, recited on beads. It is divided into three parts, each containing five decades, a decade comprising 1 Pater, 10 Aves and a Gloria, in addition to a subject for meditation selected from the "mysteries" of the life of Christ and of the Blessed Virgin. The Christian practice of repeating prayers is traceable to early times: Sozomen mentions (Hist. Eccl. vi. 29) the hermit Paul of the 4th century who threw away a pebble as he recited each of his 300 daily prayers; and a canon of the English synod of Cealcythe in 816 (Mansi xiv. 360) directed septem belitum Paternoster to be said for a deceased bishop. In many orders the lay brothers daily said a large number of Paternosters instead of reading the breviary; it was natural that the Pater- noster should be the prayer most often repeated. The Ave Maria is first mentioned as being said for half of the 11th century, but it was not until the 16th century that it became general in its present form. It is not known precisely when the mechanical device of the rosary was first used. William of Malmsbury (De gest. pont. Angl. iv. 4) says that Godiva, who founded a religious house at Coventry in 1040, left a string of jewels, on which she had told her prayers, that it might be hung on the statue of the Blessed Virgin. Thomas of Chantimpré, who wrote about the middle of the 13th century, first mentions the word "rosary" (De apibus, ii. 13), using it apparently in a mystical sense as Mary's rose-garden. There is no contemporary confirmation of the story that the rosary was given to St Dominic through revelation of the Blessed Virgin and was employed during the crusade against the Albigenses, although the story was later accepted by Leo X., Pius V., Gregory XIII., Sixtus V., Alexander VII., Innocent XI., and Clement XII. According to Benedict XIV. (De Fest. xvi), the rosary is "the traditional Dominican observance. Whatever may have been the origin of the rosary, the Dominicans did much to propagate the devotion. The practice of meditating on the mysteries doubtless began with a Dominican, Alonzo de Rupe (born 1428), and another Dominican, Jacob Sprenger (d. 1453), grand-inquisitor in Germany, founded the first confraternity of the rosary at Cologne in 1475. This society spread rapidly, and was specially privileged by Sixtus IV., Innocent VIII., and Leo X. After the battle of Lepanto (1st Sunday in October 1571), which was won while the members of the confraternity at Rome were making supplication for Christian success, Pius V. ordered an annual commemoration of "St Mary of Victory," and Gregory XIII., by bull of the 1st of April 1583, set aside the 1st Sunday in October as the feast of the Rosary of the Blessed Virgin Mary, to be observed in such churches as maintained an altar in honour of the rosary. Clement XII., by bull of the 3d of October 1771, directed the observance of the feast by all Christendom. The devotion has been particularly fostered by the Jesuits, St Ignatius Loyola having expressly ordered its use. It has been repeatedly indulged by various popes. Leo XIII. issued eight encyclicals on the devotion; he urged its recitation throughout October, and directed (1883) the insertion of the title Regina sacratissimae rosariorum in the Litany. There are several varieties of the rosary more or less in use by Roman Catholics: the Passionists, or rosary of the five wounds, approved by Leo XII. in 1823; the Crown of Our Lord, attributed to Michael of Florence, a Camaldolese monk (c. 1516), and consisting of 33 Paters, 5 Aves and a Credo; St Bridget's, 7 Paters and 63 Aves, in honour of the joys and sorrows of the Blessed Virgin and the 63 years of her life. The Living Rosary, in which 15 persons unite to say the rosary every month, was approved by Gregory XVI. (1832) and placed in charge of the Dominican order by Pius IX. (1871).

Similar expedients to assist the memory in repetitions of prayers occur among Buddhists and Mahomedans: in the former case the prayers are said on a string of some hundred beads, called the tibet-prenba or the ten-wa; in the latter case,
ROSA—ROSCHER, SIR H. E.

725

the so-called tasbih has 33, 66 or 99 beads, and is used for the repetition of the 99 names which express the attributes of God.

ROSA, JUAN MANUEL (1793-1877), tyrant of Buenos Aires, was born on the 30th of March 1803, in the city of that name. His father, Leon Ortiz de Rosas, was an owner of cattle runs (estancias) and a trader in hides, who took an active part in defeating the English attack on the city in 1807. Juan Rosas received so little education that he had to learn to read and write when he was already a married man and a successful cattle breeder. From a very early age he was left in charge of one of his father's establishments. When he was eighteen he married Maria de la Encarnacion Escuura. His mother having suspected him of appropriating money, he left his parents, and for some time subsisted by working as a vaquero or cowboy, and then as overseer on the estates of other owners; but he accumulated money, and by the help of a loan from a friend he became possessed of a cattle run of his own, Los Cerrillos. The anarchical state of the country since its independence of Spain had favoured the Indians, who had taken the offensive and raided up to within forty miles of Buenos Aires. Rosas obtained leave to arm his cowboys. Under his management Los Cerrillos became a refuge for adventurers, whom he paid and fed well, but from whom he exacted implicit obedience. His followers became a fighting force of which he was a master, and Rosas took practically the position of an independent ruler, whose help was sought by contending political parties. By attending to his own interest only, and by astute intrigue, or savage fighting when necessary, he grew in power from 1829 onwards, and from 1835 to 1852 ruled as dictator (see ARGENTINA). It is probable that he would have continued to govern in Buenos Aires till his death if his ambition had not led him into wars with all his neighbours. He wished to extend the authority of the Republic over all the territory which had belonged to the Spanish viceroyalty of Buenos Aires. This led him directly into wars with Uruguay, Paraguay and Chile, and into "warlike operations" with England and France, with whom he had other causes of quarrel arising out of the complaints of traders and bondholders. His government was overthrown in 1852 by a coalition of his neighbours and the defection of several of his generals, and even members of his own family who lived in fear of his suspicions and violence. He took refuge in England, and lived at Swaythling, near Southampton, till his death on the 14th of March 1877. A portrait taken in 1834 and reproduced by Sir Woodbine Parish in his Buenos Ayres and Provinces of the Rio de la Plata (London, 1832) represents Rosas as a fine-looking man of the handsome Spanish type. See O. Martens, Ein Caligula unseres Jahrhunderts (Berlin, 1896), which contains a full bibliography.

ROSELLINUS (Rucellus, or Rousellin) (c. 1050-c. 1122), often called the founder of Nominalism (see SCHOLASTICISM), was born at Compiègne (Compendium). Little is known of his life, and our knowledge of his doctrines is mainly derived from Anselm, Abelard and John of Salisbury. He studied at Soissons and Reims, was afterwards attached to the cathedral of Chartres, and became canon of Compiègne. It seems most probable that Roscellinus was not strictly the first to promulgate nominalistic doctrines; but in his exposition they received more definite expression, and, being applied to the dogma of the Trinity, attracted universal attention. Roscellinus maintained that it is merely a habit of speech which prevents our speaking of the three persons as three substances or three Gods. If it were otherwise, and the three persons were really one substance or thing (una res), we should be forced to admit that the Father and the Holy Spirit became incarnate along with the Son. Roscellinus seems to have put forward this doctrine in perfect good faith, and to have claimed for it at first the authority of Lanfranc and Anselm. In 1102, however, a council convened by the archbishop of Reims condemned his interpretation, and Roscellinus, who was in danger of being stoned to death by the orthodox populace, recanted his error. He fled to England, but having made himself unpopular by an attack on the doctrines of Anselm, he left the country and repaired to Rome, where he was well received and became reconciled to the Church. He then returned to France, taught at Tours and Loches (in Brittany where he had Abelard as a pupil), and finally became canon of Beauzon. He is heard of as late as 1121, when he came forward to oppose Abelard's views on the Trinity.

Of the writings of Roscellinus, nothing is preserved except a letter to Abelard, mainly concerned with the doctrine of the Trinity (ed. J. A. Schmeller, Munich, 1850). See F. Picaret, Rosellin, philosophe et théologien (1896), and authorities quoted under SCHOLASTICISM.

ROSCHER, WILHELM GEORG FRIEDRICH (1817-1894), German economist, was born at Hanover on the 21st of October 1817. He studied at Göttingen and Berlin, and obtained a professorship at Göttingen in 1844, and subsequently at Leipzig in 1848. Omitting preparatory indications and undeveloped germs of doctrine, the origin of the "historical" school of political economy may be traced to Roscher. His fundamental principles are dated, though with some hesitation, and with an unfortunate contrast of the historical with the philosophical method, in his Grundriss zu Vorlesungen über die Staatswirtschaft nach geschichtlicher Methode (1843). This short study was afterwards expanded into his great System der Volkswirtschaft, published in five volumes between 1854 and 1894, and arranged as follows: vol. i., Die Grundlagen der Nationalökonomie, 1854 (trans. by J. J. Lohr, Principles of Political Economy, Chicago, 1878); vol. ii., Die Nationalökonomie des Ackerbaues und der verwandten Upproduktionsweise, 1859; vol. iii., Die Nationalökonomie der Gewerbe, 1860; vol. iv., System der Finanzwissenschaft, 1880; vol. v., System der Armenpflege und Armenpolitik, 1894. His Geschichte der Nationalökonomie in Deutschland (1874) is a monumental work. He also published in 1842 an excellent commentary on the life and works of Thucydides. He died at Leipzig on the 4th of June 1894. See T. Roscher, Zur Geschichte der Familie Roscher in Nieder- sachsen (Hanover, 1892); Brusch, Wilhelm Roscher und die sozial- wissenschaftlichen Strömungen der Gegenwart (Leipzig, 1895).

ROSCHUS GALLUS, QUINTUS (c. 126-69 B.C.), Roman actor, was born, a slave, at Solonum, near Lanuvium. Endowed with a handsome face and manly figure, he studied the delivery and gestures of the most distinguished actors in the Forum, especially Q. Hortensius, and won universal praise for his grace and elegance on the stage. He especially excelled in comedy. Cicero took lessons from him. The two often engaged in friendly rivalry to try whether the orator or the actor could express a thought or emotion with greater effect, and Roscus wrote a treatise in which he compared acting and oratory. Q. Latiusius Catulus composed a quatrain in his honour, and the dictator Sulla presented him with a gold ring, the badge of the equestrian order, a remarkable distinction for an actor in Rome, where the profession was held in contempt. Like his contemporary Aesopus, Roscus amassed a large fortune, and he appears to have retired from the stage some time before his death. In 76 B.C. he was sued by C. Fannius for 50 sesterces (about £400), and was defended by Cicero in a famous speech.

See H. H. Pflüger, Cicero's Rede pro Q. Roscio Comodo (1904).

ROSCEO, SIR HENRY ENFIELD (1833—), English chemist, was born in London on the 7th of January 1833.
studying at Liverpool High School and University College, London, he went to Heidelberg to work under R. W. Bunsen, of whom he became lifelong friend. In 1837 he was appointed to the chair of chemistry at Owens College, Manchester, where he remained for thirty years, and from 1855 to 1895 he was M.P. for the south division of Manchester. He served on several royal commissions appointed to consider educational questions, in which he was keenly interested, and from 1896 to 1902 was vice-chancellor of London University. He was knighted in 1884. His scientific work includes a memorable series of researches carried out with Bunsen between 1855 and 1862, in which they laid the foundations of comparative photochemistry. In 1867 he began an elaborate investigation of vanadium and its compounds, and devised a process for preparing it pure in the metallic state, at the same time showing that the substance which had previously passed for the metal was contaminated with oxygen and nitrogen. He was also the author of researches on niobium, tungsten, uranium, perchloric acid, the solubility of ammonia, &c. His publications include, besides several elementary books on chemistry which have had a wide circulation and been translated into many foreign languages, "Lectures on Spectrum Analysis" (1869); a "Treatise on Chemistry" (1st edition in 1857–1861); "A New View of Dalton's Atomic Theory," with Dr A. Harden (1866); and an "Autobiography" (1906). The "Treatise on Chemistry," written in collaboration with Carl Schorlemmer (1834–1862), who was appointed his private assistant at Manchester in 1859, official assistant in the laboratory in 1861, and professor of organic chemistry in 1874, is a standard work.

ROSCEO, WILLIAM (1753–1831), English historian and miscellaneous writer, was born on the 8th of March 1753 at Liverpool, where his father, who was a market gardener, kept a publichouse known as the Bowling Green at Mount Pleasant. Roscoe was eager in the acquisition of knowledge, and at twelve he left school, having learned all that his schoolmaster could teach. He now assisted his father in the work of the garden, and gave his leisure hours to reading and study. "This mode of life," he says, "gave health and vigour to my body, and amusement and instruction to my mind; and to this day I well remember the delicious sleep which succeeded my labours, from which I was again called at an early hour. If I were now again to begin life, I should do it in the same way, and if now called upon to be the conqueror of human race, I should answer, those who cultivate the earth by their own hands." At fifteen it was necessary to decide upon a path in life. A month's trial of book-selling sufficed to disgust him, and in 1769 he was articled to a solicitor. Although a diligent student of law, he did not bid farewell to the Muses, but continued to read the classics, and made that acquaintance with the language and literature of Italy which became the instrument of his distinction in after life. He wrote many verses: his "Mount Pleasant" was composed when he was sixteen, and this and other verses, though now forgotten, won the esteem of good critics. In 1774 he commenced business as an attorney, and as soon as his professional gains warranted he married (1781) Jane, second daughter of William Griffies, a Liverpool tradesman, and had seven sons and three daughters. He had the courage to denounce the African slave trade in his native town, where not a little of the wealth came from this source. He wrote the "Writs of Africa" (1787–1788), and entered into a controversy with an ex-Roman Catholic priest, who undertook to prove the "licitness of the slave trade" from the Bible. Roscoe was also a political pamphleteer, and like many other Liberals of the day hailed the promise of liberty in the French Revolution.

Meanwhile he had steadily pursued his Italian studies, and had made extensive collections relating to the great ruler of Florence. The result was his "Life of Lorenzo de' Medici," which appeared in 1796, and at once placed him in the front rank of contemporary historians. The work has often been reprinted, and translations in French, German and other languages show that its popularity was not confined to its author's native land. Perhaps the most gratifying testimony was that of Fabroni, who had intended to translate his own Latin life of Lorenzo, but abandoned the design and induced Gaetano Mecherini to undertake an Italian version of Roscoe. In 1796 Roscoe gave up practice as an attorney, and had some thought of going to the bar, but relinquished the idea after keeping a single term. Between 1793 and 1800 he paid much attention to agriculture, and helped to reclaim Chat Moss, near Manchester. He also succeeded in restoring to good order the affairs of a banking house in which his friend William Clark, then resident in Italy, was a partner. This task led to his introduction to the business, which eventually proved disastrous. His translation of Tansillo's "Nurse" appeared in 1798, and went through several editions. It is dedicated in a sonnet to his wife, who had practised the precepts of the Italian poet.

"The Life and Pontificate of Leo the Tenth" appeared in 1805, and was a natural sequel to that by which he had made his reputation. The work, whilst it maintained its author's fame, did not, on the whole, meet with so favourable a reception as the "Life of Lorenzo." It has been frequently reprinted, and the insertion of the Italian translation in the Index did not prevent its circulation even in the papal states. Roscoe was elected member of parliament for Liverpool in 1806, but the House of Commons was not a congenial place, and at the dissolution in the following year he declined to be again a candidate. The commercial troubles of 1816 brought into difficulties the banking house with which he was connected, and forced the sale of his collection of books and pictures. It was on this occasion that he wrote the fine "Sonnet on Parting with his Books." Dr S. H. Spiker, the king of Prussia's librarian, gives an interesting account of a visit to Roscoe at this period of trouble. Roscoe said he still desired to write a biography of Erasmus but "wanted both leisure and youth." This project was not executed (Spiker's "Travels through England," &c., 1816). After a five years' struggle to discharge the liabilities of the bank, the action of a small number of creditors forced the partners into bankruptcy in 1820. For a time Roscoe was in danger of arrest, but ultimately he received honourable discharge. On the dispersal of his library, the volumes most useful to him were secured by friends and placed in the Liverpool Athenaeum. The sum of £2500 was also invested for his benefit. The independent and sensitive nature of Roscoe made both these operations difficult. Having now resigned commercial pursuits for ever, he devoted himself to the arrangement of the great library at Holkham, the property of his friend Coke. In 1822 he issued an appendix of illustrations to his "Lorenzo" and also a "Memoir of Richard Robert Jones of Aberdaron," a remarkable self-taught linguist. The year 1824 was memorable for the death of his wife and the publication of his edition of the works of Pope, which involved him in a controversy with Bowles.

His versatility was shown by the appearance of a folio monograph on the "Monandric Plants," which was published in 1828. It appeared first in numbers, and the last part came out after his recovery from a paralytic attack. He died on the 30th of June 1831.

Roscoe's character was a fine one. Under circumstances uncongenial and discouraging he steadfastly maintained the ideal of the intellectual life. Sensitive and conscientious, he sacrificed his possessions to a punctilious sense of duty. He had the courage of unpopular opinions, and, whilst promoting every good object in his native town, did not hesitate to speak out where plain dealing, as in the matter of slavery, was required. He was a sincere friend and exemplary in his walk of life, and a pleasant man in his intercourse with the world. The verdict of Horace Walpole, who thought Roscoe "by far the best of our historians," but in spite of newer lights and of some changes of fashion in the world of letters, his books on Lorenzo de' Medici and Leo X. remain important contributions to historical literature.

In addition to the writings already named, Roscoe wrote tracts on penal jurisprudence, and contributed to the "Transactions of the Royal Society of Literature and of the Linnean Society. The first collected edition of his "Poetical Works" was published in 1857, and
is sadly incomplete, omitting, with other verses known to be from his pen, the Butterfly’s Ball, a fantasy, which has charmed thousands of children since it appeared in 1807. Other verses are in Poems for Youth, by a Family Circle (1820). This is one of his books (2 vols., London, 1833) contains full details of Roscoe’s career, and there are references to him in the Autobiographical Sketches of De Quincey, and in Washington Irving’s Sketch Book. (W. E. A. A.)

ROSCOFF, a maritime town and watering-place of northwestern France, in the department of Finistère, on the English Channel, 173 m. N.W. of Morlaix by rail. Pop. (1906) town, 1084; commune, 5054. Roscoff, separated from the Ile de Batz by a narrow channel, has a tidal port used by fishing and coasting vessels. Many of the inhabitants are engaged in the cultivation of early vegetables, to which the growth of which the mild climate and fertile soil is eminently favourable. The church of Roscoff (16th century) has a fine Renaissance tower and contains interesting ecclesiastical antiquities. The ruined chapel of St Ninian commemorates the landing at Roscoff in 1548 of Mary Stuart, previous to her betrothal with the dauphin, son of Henry II. In 1746 Charles Edward, the young Pretender, landed at the port after his defeat at Culloden.

ROSCOMMON, WENTWORTH DILLON, 4TH EARL OF (c. 1630–1685), English poet, was born in Ireland about 1630. He was a nephew of Thomas Wentworth, earl of Strafford, and was educated partly under a tutor at his uncle’s seat in Yorkshire, partly at Caen in Normandy and partly at Rome. After the Restoration he returned to England, and was well received at court. In 1649 he had succeeded to the earldom of Roscommon, which had been created in 1622 for his great-grandfather, James Dillon; and he was now put in possession by act of parliament of all the lands possessed by his family before the Civil War. As captain of the Gentleman Pensioners he found abundant opportunity to indulge the love of gambling, which appears to have been his only vice. Disputes with the Lord Privy Seal about his Irish estates necessitated his presence in Ireland, where he gave proof of some business capacity. On his return to London he was made master of the horse to the duchess of York. He was twice married, in 1662 to Lady Frances Boyle, widow of Colonel Francis Courtney, and in 1674 to Isabella Boynton.

His reputation as a didactic writer and critic rests on his blank verse translation of the Ars Poetica (1680) and his Essay on Translated Verse (1684). The essay contained the first definite enunciation of the principles of “poetic diction,” which were to be fully developed in the reign of Queen Anne. Roscomman, who was fastidious in his notions of “dignified writing,” was himself a very correct writer, and quite free from the indecencies of his contemporaries. Alexander Pope, who seems to have learnt something from his carefully balanced phrases and the regular cadence of his verse, says that “In all Charles’s days, Roscomman only boasts unspotted days.” He saw clearly that a low code of morals was necessarily followed by a corresponding degradation in literature, and he insists that sincerity and sympathy with the subject in hand are essential qualities in the poet. This elevated conception of his art is in itself no small merit. He has, moreover, the distinction of having been the first critic to avow his admiration for Paradise Lost. Roscomman formed a small literary society which he hoped to develop into an academy with authority to formulate rules on language and style, but its influence only extended to a limited circle, and the scheme fell through after its promoter’s death. He was buried in Westminster Abbey on the 21st of January 1685.

The title passed to his uncle, Carey Dillon (1627–1688). In 1746, on the death of James, the 8th earl, it passed to Robert Dillon (d. 1770), a descendant of the 1st earl. His family became extinct in 1802. Michael James Robert Dillon, another descendant of the 1st earl, established his title to the earldom before the House of Lords. When he died in May 1850 it became extinct.

Roscomman’s poems were collected in 1701, and are included in A Pindar’s and Ban- refusal collection of the British poets. He also translated into French from the English of Dr W. Sherlock, Traité touchant l’obéissance passive (1686).

ROSCOMMON, a county of Ireland in the province of Connaught, bounded N.E. by Leitrín, N.W. by Sligo, W. by Mayo, and S. by Galway, E. by Longford and E. by Westmeath and King’s County. The area is 629,653 acres, or about 985 sq. m. The greater part of the county belongs to the great limestone plain of central Ireland, and is either flat or very slightly undulating. In the north-east, on the Leitrín border, the Braulieve Mountains, consisting of rugged and precipitous ridges with flattened summits, attain an elevation in Cashel Mountain of 1377 ft.; and in the north-west the Curlew Mountains, of similar formation, between Roscomman and Sligo, rise abruptly to a height over 800 ft. In the east the Slievebawn range, formed of sandstone, have a similar elevation. The Shannon with its expansions forms nearly the whole eastern boundary of the county, and on the west the Suck from Mayo forms for over 50 m. the boundary with Galway till it unites with the Shannon at Shannon Bridge. The other tributaries of the Shannon within the county are the Arigna, the Feorish and the Boyle. The lakes formed by expansions of the Shannon on the borders of Co. Roscomman are Loughs Allen, Boderg, Boffin, Forbes and Ree. Of the numerous other lakes within the county the most important are Lough Key in the north, very picturesquely situated with finely wooded banks, and Lough Gara (mostly in Co. Sligo) in the north-west.

In this long county one may travel fifty miles across the Carboniferous Limestone plain, with the grey rock cropping out here and there, and long grass-covered esker-ridges forming the only obstacle to the roads. Lough Ree is a typical lake of the plain. Two inlers of Silurian rocks have been thrust up, forming hills between Lough Ree and Lough Boffin. At Boyle, however, higher Old Red Sandstone country is encountered, and farther north the Millstone Grit and Coal-Measure series cap the mountains almost horizontally at Arigna near Lough Allen. The nodules of clay-ironstone here were formerly smelted, and the seams of bituminous coal, mostly on Millstone Grit horizons, are worked successfully on a high level of the mountains.

The subsoil is principally limestone, but there is some light, sandy soil in the south. In the level parts the land when drained and properly cultivated is very fertile, especially in the district known as the plains of Boyle, which includes some of the richest grazing land in Ireland. Along the banks of the Suck and Shannon there is, however, a large extent of bog and marsh. The proportion of tillage to pasture is roughly as one to three. Oats and potatoes are the principal crops, but the acreage devoted to them decreases; the numbers of cattle, sheep, pigs, goats and poultry, on the other hand, are proportionately large and increasing. Communications are afforded by the Midland Great Western railway, the Sligo line of that system crossing the northern part of the county by the Athlone and Mayo line passing from S.E. to N.W. by the towns of Roscomman and Castlerea, and the Athlone and Galway line crossing the southern part.

The population was 116,552 in 1801, and 101,701 in 1901; 97% are Roman Catholics, and nearly the whole population is rural. The chief towns are Boyle, Roscomman, Elphin and Castlerea; and a small portion of Carrick-on-Shannon, including the railway station, is in this county, the major portion being in Co. Leitrín. The county is divided into ten baronies. Ecclesiastically it belongs to the Protestant dioceses of Elphin and Ardagh (united with Kilmore and Tuam), and to the Roman Catholic dioceses of Tuam, Clonfert, Achonry, Elphin and Ardagh. Assizes are held at Roscomman and quarter sessions at Boyle, Strokestown and Roscomman. The county returns two members to parliament. To the Irish parliament before the Union of 1800 two members were returned for the county, and two each for the boroughs of Boyle, Roscomman and Tulsk.

The district was granted by Henry III. to Richard de Burgo, but remained almost wholly in the possession of the native septs. Until the time of Elizabeth Connacht was included in the two districts of Roscomman and Clare, but in 1570 it
was further subdivided by Sir Henry Sydney, and was assigned its present limits. All the old proprietors were dispossessed at the Cromwellian settlement, except the O’Conor family headed by the O’Conor Don. The most interesting antiquarian remains within the county are the ruins of Crogan, the ancient palace of the kings of Connought. The principal ancient castles are the old stronghold of the M’Dermotts on Castle Island, Lough Key, the dismantled castle of the M'Donoughs at Ballinafad, and the extensive fortress at Roscommon rebuilt by John d’Ufford, justiciary of Ireland in 1268. There are fragments of a round tower at Oran. The abbey of Boyle is in remarkably good preservation, and exhibits fine specimens of the Norman arch. The other monastic remains within the county, with the exception of the abbey of Roscommon, are of comparatively small importance. The Irish bard Carolan, who died in 1738, is buried by the ruined church of Kilronan, in the extreme north of the county. The bishopric of Elphin was united with Kilmore and Ardagh in 1533, and the former cathedral and episcopal buildings are largely modernized.

**ROSCOMMON**, a market town and the county town of Co. Roscommone, Ireland, situated on rising ground in a bare plain in the centre of the county, on the Mayo line of the Midland Great Western railway, 15½ m. N.W. by N. from Athlone. Pop. (1901) 1891. It contains the county buildings, and has Protestant and Roman Catholic churches, the latter of which is a fine building completed in 1903. An extensive trade is carried on in agricultural produce and live stock. A castle, dating from 1268, when it was founded by John d’Ufford, justiciary of Ireland, stands, an imposing mass of ruins, but far gone in decay, overlooking the plain. It fell to besiegers in 1566, 1642 and 1653, and was partially burned after the battle of Aughrim in 1691. There are also remains of a Dominican priory of the middle of the 13th century, founded by Felim O’Conor, king of Connaught, and exhibiting fine, though mutilated, details of the style of that period. The name of the town, signifying the river Coman’s wood, is derived from the spot who founded the monastery of Canons Regular here in the 12th century. The town received charters from Edward I. and James I. Two m. N.E. are small remains of the abbey of Deene.

**ROSCREA**, a market town near the north-western border of Co. Tipperary, Ireland, pleasantly situated on undulating ground connecting the Devil’s Bit and the Sleive Bloom mountains. Pop. (1901) 2325. It is 77 m. W.S.W. from Dublin on the Ballybrophy and Limerick branch of the Great Southern & Western railway. A branch line runs northward to Birr or Parsonstown. Flour-milling and tanning are industries, and monthly cattle fairs are held. There is a branch here of the Trappist Monastery of Mount Melleray in Co. Waterford. The antiquarian remains are of interest. These include portions of an Augustinian abbey, founded by St Cronan, early in the 7th century, which are incorporated into the church. Out of this abbey a diocese grew, to be united with that of Killaloe in the 12th century. The Book of Dimma, consisting of the gospels and accompanied by a brazen shrine, ornamented with silver and tracery, and preserved in the library of Trinity College, Dublin. A cross and a shrine of St Cronan are in the churchyard. There are also a round tower, 80 ft. in height, but lacking the upper storeys, and a Franciscan friary (1400); while a circular tower, and a square keep (occupied as barracks), mark strongholds, the one built by King John and the other by the Ormondes, and testify to the former importance of the town, which was doubtless accen- tuated by its physical position in a passway between the neighbouring mountain ranges. Leap Castle, about 4 m. N., is another fortified mansion, which is still inhabited.

**ROSE**, the name of a distinguished family of German chemists. **VALENTINE ROSE** the elder was born on the 16th of August 1736 at Neu-Ruppin, and died on the 28th of April 1771 at Berlin, where he was an apothecary and for some short time before his death assessor of the Ober Collegium Medicum. He was the discoverer of "Rose's fusible metal" (see FUSIBLE METAL). His son, **VALENTINE ROSE** the younger, born on the 31st of October 1762 at Berlin, was also an apothecary in that city and assessor of the Ober Collegium Medicum from 1797. It was he who in 1800 proved that sulphuric ether contains no sulphur. He died in Berlin on the 4th of August 1827, leaving four sons, one of whom, Heinrich, was a distinguished chemist, and another, Gustav, a crystallographer and mineralogist. **HEINRICH ROSE**, born at Berlin on the 6th of August 1705, began to learn pharmacy in Danzig, where, during the siege of 1807, he nearly lost his life from typhus. Like his brother he served in the campaign of 1815. During the summer of the following year he studied at Berlin under M. H. Klaproth, a devoted friend of the family, and in the autumn entered a pharmacy at Mitau. In 1819 he went to Stockholm, where he spent a year and a half with J. J. Berzelius, and in 1821 he graduated at Kiel. Returning to Berlin he became a Privatdozent in the university in 1822, extraordinary professor of chemistry in 1823 and ordinary professor in 1835, and there he died on the 27th of January 1864. He devoted himself especially to inorganic chemistry and the development of analytical methods, and the results of his work are summed up in the successive issues of his classical work, Ausführliches Handbuch der analytischen Chemie, of which he published the first edition at Berlin in 1829, and the sixth, practically a new work in French, at Paris in 1861. He was the discoverer of antimony pentachloride, and mention may also be made of his researches on the influence of the mass-action of water in many reactions, carried out before the investigations of Guldberg and Waage in 1867. **GUSTAV ROSE**, born at Berlin on the 15th of March 1798, began his career as a mining engineer, but soon turned his attention to theoretical studies. A pupil of Berzelius like his brother, he graduated in 1820 at Berlin University where he became successively Privatdozent (1823), extraordinary professor of mineralogy (1826) and ordinary professor (1839). In 1836 he succeeded to the directorship of the Royal Mineralogical Museum at Berlin, and he helped to found the German Geological Society, of which he was president from 1851 until the end of his life. He made many journeys in different parts of Europe for the sake of mineralogical study, and in 1829 with A. von Humboldt and C. G. Ehrenberg (1795-1876), professor of medicine at Berlin, took part in an expedition to the Ural and Altai mountains and the Caspian Sea, which yielded information of primary importance concerning the mineralogy of the Russian Empire. His work covered every branch of mineralogy, including crystals, and the artificial formation of minerals. The science of petrography, according to Gerhard vom Rath, originated with him. He was the first in his own country to use the reflecting goniometer for the measurement of the angles of crystals, and to teach the method of studying rocks by means of microscopic sections. He also devoted special attention to meteorites and to the problem presented by the different structure of the stony matter in them and in the crust of the earth, and just before his death, which took place at Berlin on the 15th of July 1863, he was engaged in investigating the formation of the diamond. In addition to many scientific memoirs he published Elemente der Krystallographie (1839); Mineralogisch-geognostische Reise nach dem Ural, dem Altai und dem Kaspiische Meer (1837) vol. i.; (1842) vol. ii.; Das Krystallo-chemische Mineral- system (1852); and Beschreibung und Eintheilung der Meteoriten (1863).

**ROSE, GEORGE** (1744-1818), British politician, was born on the 17th of June 1744, and was educated at Westminster school, afterwards entering the navy, a service which he left in 1762 after he had taken part in some fighting in the West Indies. He then obtained a position in the Civil Service, becoming joint keeper of the records in 1772 and secretary to the board of taxes in 1777. In 1782 he gave up the latter appointment to become one of the secretaries to the treasury under Lord Shelburne, though he did not enter parliament. He left office with his colleagues in April 1783, but in the following December he returned to his former position at the treasury in Pitt's ministry, being henceforward one of this minister's most steadfast supporters. He entered parliament as member for Launceston
early in 1784, and his fidelity and friendship were rewarded by Pitt, who gave him a lucrative post in the court of exchequer; in 1788 he became clerk of the parliament. In 1801 Rose left office with Pitt, but returned with him to power in 1804, when he was made vice-president of the committee on trade and joint paymaster-general. He resigned these offices a few days after Pitt's death in 1806, but he served as vice-president of the committee on trade and treasurer of the navy under the duke of Portland and Spencer Perceval from 1807 to 1812. He was again treasurer of the navy under Lord Liverpool, and he was still member of parliament for Christchurch, a seat which he had held since 1796, when he died at Cuffeills, in Hampshire, on the 13th of January 1818. Rose was an able and conscientious public servant, although he and his two sons drew a large amount of money from sinners, a fact referred to by William Cobbett in his "A New Year's Gift to old George Rose." He wrote several books on economic subjects, and his Diaries and Correspondence, edited by the Rev. L. V. Harcourt, was published in 1860.

Rose, Hugh James (1795-1838), English divine, was born at Little Horsted in Sussex on the 9th of June 1795, and was educated at Uckfield school and at Trinity College, Cambridge, where he graduated B.A. in 1817, but missed a fellowship. Taking orders, he was appointed to Buxted, Sussex, in 1819, and to the vicarage of Horsham in 1821. He had already attained some repute as a critic, which was enhanced when, after travelling in Germany, he delivered as select preacher at Cambridge, four addresses against rationalism, published in 1825 as The State of the Protestant Religion in Germany. The book was severely criticized in Germany, and in England by E. B. Pusey. In 1827 Rose was collated to the prebend of Middleton; in 1836 he accepted the rectory of Hadleigh, Suffolk, and in 1833 that of Fairford, Essex, and in 1835 the perpetual curacy of St Thomas's, Southwark. In 1833-1834 he was professor of divinity at Durham, a post which ill-health forced him to resign. In 1836 he became editor of the Encyclopædia Metropolitana, and he projected the New General Biographical Dictionary, a scheme carried through by his brother Henry John Rose (1800-1873). He was appointed principal of King's College, London, in October 1836, but he was attacked by influenza, and after two years of ill-health he died at Florence on the 22nd of December 1838. Rose was a high-churchman, who to propagate his views in 1832 founded the British Magazine and so came into touch with the leaders of the Oxford movement. Out of a conference at his rectory in Hadleigh came the Association of Friends of the Church, formed by R. H. Froude and William Palmer.

Rose, William Stewart (1775-1843), English poet and translator, second son of George Rose (q.v.), was born in 1775. He was educated at Eton College, and in 1796 returned to parliament for the borough of Christchurch. In 1800 he accepted the Chiltern Hundreds on his appointment as reading clerk of the House of Lords and clerk of the private committees. His first work, A Naval History of the Late War, was undertaken at his father's wish, but he only completed one volume. He produced a free version of the Amaudis de Gaul from the French text of Hérberay des Essarts in 1803, followed by a translation of the Partenope de Blois (1807) after Le Grand d'Assy. With Partenope he printed his ballad of "The Red King," and in 1810 appeared The Crusade of King Louis and King Edward the Martyr. In 1814 he made a prolonged journey through Italy and eastern Europe, spending the year 1817 at Venice, where he married a Venetian lady. The Court and Parliament of Bees, a translation of the Animali Parlanti di Casti, and Letters from the North of Italy, addressed to Henry Hallam, Esq., appeared in 1819. In the same year the publisher Murray offered him £1000 for a translation of Ariosto (T. Moore, Diary, 14th of April 1819). He had already written an abridged version of Berni's rifacimento of the Orlando Innamorato of Boiardo, and had begun his Orlando Furioso translated into English Verse which appeared in two parts in 1823 and 1831. This, which has become the standard English version, is a close rendering in the ottava rima of the original. Rose retired from his official position in 1824. He suffered from paralysis in his later years, and at Abbotsford, where he was an honoured guest, rooms were specially fitted up on the ground floor for his use. His last works were An Epistle to the Right Honourable John Flood, 1st, Freere (1834), in verse, and a volume of Rhymes (1837) (see Quarterly Review, July 1836 and April 1837). He died on the 30th of April 1843.

Rose (Rosa). The rose has for all ages been the favourite flower, and as such it has a place in general literature that no other plant can rival. In most cases the rose of the poets and the rose of the botanist are one and the same in kind, but popular usage has attached the name rose to a variety of plants whose kinship to the true plant no botanist would for a moment admit. In this place we shall employ the word in its strict botanical significance, and in commenting on it treat it solely from the botanical point of view. The rose gives its name to the order Rosaceae, of which it may be considered the type. The genus consists of species varying in number, according to the diverse opinions of botanists of opposite schools, from thirty to one hundred and eighty, or even two hundred and fifty, exclusive of the many hundreds of mere garden varieties. While the lowest estimate is doubtless too low, the highest is enormously too large, but in any case the wide discrepancies above alluded to illustrate very forcibly the extreme variability of the plants, their adaptability to various conditions, and consequently their wide dispersion over the globe, the facility with which they are cultivated, and the readiness with which new varieties are continually being produced in gardens by the art of the hybridizer or the careful selection of the raiser. The species are native of all parts of the northern hemisphere, but scantly represented in the tropics unless at considerable elevations.

They are erect or climbing shrubs, never herbs or trees, generally more or less copiously armed with prickles of various shapes and with glandular hairs, as in the sweet-brier or in the moss-rose of gardens. The prickles serve the purpose of enabling the shrub to sustain itself amid other vegetation. The cut end of a root, which is 50 ft. long, or in the neighbourhood of the flower serve to arrest the progress of undesirable visitors, while the perfume emitted by the glands in question may co-operate with the fragrance of the flower to attract birds, which devour the hips and thus secure the dispersion of the seed. The dry one-seeded fruits (achenes) are densely packed inside the hip, and are covered with stiff hairs which cling to the bird's beak. The stamens are in whorls, and, according to Payer, they originate in pairs on one side of the base of
ROSE

each petal so that there are ten in each row; a second row of ten alternates with the first, a third with the second, and so on. By repeated radial and tangential branching a vast number of stamens are ultimately produced, and when these stamens assume a petaloid aspect we have as a consequence the double flowers which are so much admired. The carpels are much less subject to this peraloid change, and, as it generally happens in the most double of roses that some few at least of the anthers are formed with pollen, the production of seed and the possibility of cross-breeding become intelligible. Under natural circumstances rose flowers do not secrete honey, the attraction for insects being provided by the colour and perfume and the abundance of pollen for food. The stigmas and anthers come to maturity at the same time, and thus, while cross-fertilization by insect agency is doubtless most common, self-fertilization is not prevented.

The large number of species, subspecies, varieties and forms described as British may be included under about a dozen species. Among them may be mentioned R. spinosissima, the Scotch rose, much less variable than the others; R. rubiginosa (or R. eglanteria), the sweet-brier, represented by several varieties; R. canina, the dog rose (see fig.), including numerous subspecies and varieties; the large-fruited apple rose, R. pomifera; and R. arvensis, the parent of the Ayrshire roses. Cultivated roses are frequently "budded" or worked upon the stems of the brier or R. canina, or upon young seedling plants of the same species; and upon stems of an Italian rose called the Manetti, raised in the Milan Botanic Gardens about 1837. Other species, notably R. polyantha, also are used for stocks.

Roses have been grown for so many centuries and have been crossed and recrossed so often that it is difficult to refer the cultivated forms to their wild prototypes. The older roses doubtless originated from R. gallica, a native of central and southern Europe. R. centifolia (the cabbage rose), a native of the Caucasus, contributed its share. A cross between the two species named may have been the source whence originated the Bourbon roses. The yellow-flowered Austrian and Persian brier originated from R. lutea, a native of Austria and the East. The monthly or China roses sprang from the Chinese R. indica and these, crossed with others of the R. centifolia or gallica type, are the source of the "hybrid perpetuals" so commonly grown nowadays, because, in addition to their other attractions, their blooming season is relatively prolonged, and, moreover, is repeated in the autumn. Tea roses and noisettes, it is to be presumed, also acknowledge R. indica as one of their progenitors. A magnificent race called "hybrid teas" have been evolved of late years, by crossing the tea roses and hybrid perpetuals. They are much more vigorous in constitution than the true tea roses, while quite as beautiful in blossom and more perpetual in bloom than the hybrid perpetuals. Recently, by crossing the Japanese R. Wichuraiana with hybrid perpetuals, a beautiful and vigorous race of climbers has been produced. The Banksian rose is a Chinese climbing species, with small white or fawn-coloured flowers of great beauty, but rarely seen; the Macartney rose (R. bracteata) is also of Chinese origin. Its nearly evergreen deep green leaves and large white flowers are very striking. The Japanese R. rugosa is also a remarkable species, notable for its bold rugose foliage, its large white or pink flowers, and its conspicuous globular fruit. R. damascena is cultivated in some parts of the Balkans for the purpose of making attar of roses. In Germany the same variety of rose is used, while at Grasse a strain of the Provence rose is cultivated for the same purpose. In India R. damascena is grown largely near Ghazipur for the purpose of procuring attar of roses and rose water.

Rose water is chiefly produced in Europe from the Provence or cabbage rose, R. centifolia, grown for the purpose at Mitcham and much more abundantly in the south of France. Consevare of roses and infusion of roses, two medicinal preparations required for their agreeable qualities rather than for any special virtue, are prepared from the petals of R. gallica, one variety of which was formerly grown for the purpose near the town of Provins. Consevare of dog rose is made from the ripe hips of the dog rose, R. canina. Its only use is in the manufacture of pills.

The rose is so universal a favourite that some portion of the garden must necessarily be devoted to it, if the situation be at all favourable. Many choice roses will not, however, thrive in the vicinity of large towns, since they require a pure air, and do not endure a smoky atmosphere. The best soil for them is a deep rich loam free from stagnant moisture. Very light sandy or gravelly soils, or soils which are clayey and badly drained, are not suitable, and both must be greatly improved if rose-growing on them is attempted. Light soils would be improved by a dressing of cow and horse manure, with cow-dung or night soil; the latter, if provided it is properly prepared and not too fresh, is indeed the very best manure for roses in all but soils which are naturally very rich. Heavy soils are improved by adding burned earth or gritty refuse; with stable manure and leaf mould, &c., &c.; and damp soils must necessarily be drained by trenching. Tea roses may, however, be grown to perfection in a gravel soil, provided it be well manured, cow manure being best. Roses generally require a constant annual supply of manure, and if this is given as a mulching in autumn, it serves to protect their roots through the winter. They also require liberal supplies of water during the growing season, unless the surface is mulched or top-dressed from time to time with a layer of manure. Aphides and other insects of all kinds may be checked by spraying with dilute tobacco water or some of the many insecticides now provided to facilitate this rather troublesome task.

Some growers prefer roses grown on their own roots, some on the Manetti and others on the brier stock. There is this to be said in favour of their own roots that, if the tops are killed down by accident or by severe weather, the roots will usually throw up new shoots. It may be laid down as a general rule that the more strongly growing varieties should be less severely cut back than the weakly varieties; and, again, the more tender the variety, the later in the spring should the pruning be done, April being the best month for pruning teas and noisettes. It should be remembered also that no
amount of correct pruning will improve a rose bush that has been badly planted or placed in a quite unsuitable position. Where dwarf beds of roses are required, a good plan is to peg down to within about 6 in. from the ground the strong one-year-old shoots from the root. In due time blooming shoots break out from nearly every eye, and masses of flowers are secured, while the short young shoots are thrown up from the centre, the plant being on its own roots. Before winter sets in, the old shoots which have thus flowered and exhausted themselves are cut away, and the reader is strongly advised that rills or furrows are reserved for pegging down the following season, which should be done about February. In the meantime, after the pruning has been effected, plenty of good manure should have been dug in lighty about the plants. In the fall, or after the first frost, the nettle plant is quite a useful one, for its presence plenty of strong wood for pegging down each succeeding season.

The most troublesome fungoid pest of the rose is undoubtedly the mildew (Sphaerotheca pannosa). The young shoots, leaves and flower-buds frequently become covered with a delicate white mycelium, which means of the suckers it sends into the underlying cells robs its host of considerable amounts of food, and causes the leaves to curl and fall early. The spores are produced in great abundance and carried by animals and the wind to other plants, and so the disease is rapidly spread. Later the mycelium increases and forms a thick velvety coating on the young shoots, and in this the winter state of the fungus is produced. Spraying with potassium sulphide (1 oz. to 2 to 3 gallons of water) is the best means of checking mildew. The best (and the first) (P. corticatum) appears on both cultivated and wild roses in the spring, bursting through the bark in the form of copious masses of orange powder consisting of the spores of the fungus. These spores infect the rose, spreading on them in the summer small dots of an orange colour and, later, greenish spores, which form in the winter. The last, the teleutospores, are of a dark colour, and it is by these that the disease is started in the spring. It is therefore important that all the affected leaves should be destroyed in the autumn; the worst of these should be sprayed with Bordeaux mixture or ammoniacal copper carbonate in the spring to prevent the infection of the leaves by spores brought from a distance. Many other fungi attack the rose, but perhaps the only one that merits consideration is "Aphis Rosae," this is a true rots leaves forming large dark blotches upon them and frequently causing them to fall prematurely.

A very large number of insect pests are found upon the rose, but the most formidable in our climate is the aphid. More than one species is found upon the rose, though Aphis Rosae is the commonest. Their attack should be checked by the use of a spray made by boiling 4 oz. of soft soap in 4 or 5 gallons of soft water, straining off the solution and dissolving therein 4 oz. of soft soap while it is still warm, afterwards adding 1 or 2 gallons of soft water according to the age of the rose leaves that are to be sprayed. Any delay in dealing with the pest gives the opportunity for its increase, even a day will materially to augment their numbers.

Many larvae of some of the Tortrix moths fold the leaves almost as soon as they are developed from the bud, and do considerable damage in this way and by devouring the leaves, while several "looper" caterpillars which feed on the young shoots of the rose are also known to attack the rose, feeding either upon the leaves or devouring the young shoots. These larvae should be carefully searched for and destroyed whenever found. One of the leaf-cutting bees, Megachile, cuts pieces out of the leaves with which to line its nest, materially reducing their effective surface. The bees may be caught in a butterfly net or traced to their nests, which should be destroyed.

For further information see the late Dean Hole's "Book about Roses" (1894); "Book of the Rose," by Rev. A. Foster Mellais (1905); "Beautiful Roses for Garden and Greenhouse," by J. Weathers (1903); and "Roses, their History, Development and Cultivation," by the Rev. J. H. Pemberton (1908).

ROSEBERY, ARCHIBALD PHILIP PRIMROSE, 5th EARL OF (1847-1939), British statesman, born in London on the 7th of May 1847, was the grandson and successor to the title of Archibald John Primrose, 4th earl of Rosebery (1873-1868), a representative peer of Scotland, who was in 1858 created a peer of the United Kingdom as Baron Rosebery, and was an active supporter of the Reform Bill. The Scottish earldom was first conferred on the 4th earl's great-grandfather, Archibald Primrose of Dalmeny (1648-1723), a staunch Whig and a commissioner for the Union. The 4th earl's only daughter Catherine Lucy Wilhelmina, only daughter of Philip Henry, 4th Earl Stanhope, she was thus a sister of Earl Stanhope, the historian, and a niece of Lady Hester Stanhope, who was the niece of William Pitt. A celebrated beauty, a maid of honour and bridesmaid of Queen Victoria, she married, on the 20th of December 1843, Archibald, Lord Dalmeny (1809-1851), member for the Stirling Burghs, who became the lord of the admiralty under Melbourne. After his death she became the wife of Harry George Vane, 4th duke of Cleveland, and died in 1939.

The young Lord Dalmeny was educated at Brighton and at Eton, where he had as slightly junior contemporaries Mr. A. J. Balfour and Lord Randolph Churchill. He was described by the most brilliant Eton tutor of his day, William Johnson Cory (author of "Ionia"), as a "portentously wise youth, not, however, deficient in fun." He added that Dalmeny "desired the palm without the dust." In 1866 he matriculated at Christ Church, Oxford, but went down in 1868, by the request of the dean, rather than abandon the possession of a small racing stud. In the same year he succeeded to the earldom and to the family estates. In February 1871 he seconded the Address in the House of Lords; a more original effort followed in November 1871, when he delivered a remarkable essay on the Union of Scotland and England at the Edinburgh Philosophical Institution. Three years later he was elected president of the Social Science Congress at Glasgow, where, on the 20th of September, he gave a striking address upon the discovery of means for raising the condition of the working class as the "true lever of empire." In the meantime he travelled in the south of Europe and in North America. On his return he acquired an English country house called The Durdans, Epom, which he later rebuilt and added to, with large parts of the old manor house of George Strode. Following the example, as he declared, of Oliver Cromwell (for whom he had admired a speech of Cromwell's in 1690 in the erection of a statue outside Westminster Hall, which was not appreciated either by the Irish Nationalist party or by others among his political associates), he took a pride in owning racehorses, and afterwards won the Derby three times, in 1894, 1895 and 1905. He was the first man to enjoy the distinction of winning the Derby while prime minister; but though this was popular enough among many classes, it did not please the Liberal Non-conformists so much, who considered a racehorse a mere gambling-machine. On the 20th of March 1878 Lord Rosebery married Hannah, only child of Baron Meyer Amschel de Rothschild, of Mentmore, Bucks. The newly married couple took a lease of Lansdowne House, which for several years was a salon for the Liberal party and a centre of hospitality for a much wider circle.

Though impeded in his political career by his exclusion from the House of Commons, Lord Rosebery's reputation as a social reformer and orator was steadily growing. In 1880 he was elected Lord Rector of the University of Edinburgh, and in 1884 he was granted a fellowship at Oxford University, where he gave an eloquent address upon Patriotism. In 1886 he entertained Mr Gladstone at Dalmeny, and during the "Midlothian campaign" he had much to do with the stage-management of the demonstrations. As was shown later, he imported into his views of politics a warm sentiment and an imaginative outlook; and he was an enthusiastic student of Lord Beaconsfield's political novels, more particularly of "Sybil," after the heroine in which he named one of his daughters. In August 1881 he became under-secretary at the Home Office, his immediate chief being Sir William Harcourt. His work was practically confined to the direction of the Scottish department of the Office. A clamour was nevertheless raised in regard to the incompatibility of the under-secretaryship with a position in the House of Lords, and Lord Rosebery resigned the post in June 1883. He and his wife utilized the interval to make a trip round the world, being most warmly received in Australia, and returning by way of India. At the close of 1884 he resumed office as first commissioner of works with a seat in the Cabinet, and a number of his proposals in the direction of strength and efficiency were accepted by the Liberal ministry, which was much discredited by the tragedy attached to the fate of Gordon. The attitude of the government on the Afghan question and generally in regard to Russia was held by many to have been perceptibly stiffened owing to Lord Rosebery's influence.
In June 1885 the Liberal administration broke up, but Lord Salisbury's ministry, which succeeded, was broken early in February 1886, and in March Granville and Earl Granville, Lord Rosebery threw in his lot with the old leader, and was made secretary of state for foreign affairs during the brief Liberal ministry which followed. He rather distinguished himself in the Lucia Bay negotiations then being carried on with Germany. If Busch is to be believed, Prince Bismarck's view was that Lord Rosebery had "quite mesmerized" Count Herbert Bismarck; and the latter, from his father's standpoint, conceded too much to Lord Rosebery, who proved himself to be, in Bismarck's language, "very sharp." His views on foreign policy differed materially from those of Granville and Gladstone. His mind was dwelling constantly upon the political legacy of the two Pitts; he was a reader of Sir John Seeley; he had himself visited the colonies; had predicted that a war would not, as was commonly said, disintegrate the empire, but rather the reverse; had magnified the importance of taking colonial opinion; and had always been a convinced advocate of some form of Imperial Federation. He was already taunted with being an Imperialist, but his independent attitude won public approval. Cambridge gave him the degree of LL.D. in 1888; in January 1889 he was elected a member of the first county council of London, and on the 12th of February he was elected chairman of that body by 104 votes to 17. The tact, assiduity and dignity with which he guided the deliberations of the council made him exceedingly popular with its members. In the spring of 1890 he presided over the Co-operative Congress, but with a view to the impending political campaign he found it necessary to resign the chairmanship of the county council in June. In November of this year, however, Lady Rosebery died, and he withdrew for a period from public business. In 1891 he made some brief continental visits, one to Madrid, and in October he saw through the press his little monograph upon William Pitt, in the Two Hundred Speeches Series, of which it may be said that it competes in interest with Viscount Morley's Walpole. In January 1892, upon a new election, he again for a few months became chairman of the county council. It was already recognized that in him the country possessed not only a public man of exceptionally attractive personality, but one whose literary tastes were combined with a gift for expression which was at once original and fluent. In October the Garter was conferred upon him by Queen Victoria.

Meanwhile, in August, upon the return of Gladstone to power, he was induced with some difficulty (for he was suffering at the time from insomnia) to resume his position as foreign minister. His acceptance was construed as a security against the suspicion of weakness abroad which the Liberal party had incurred by their foreign policy during the 'eighties. He strongly opposed the evacuation of Egypt; he insisted upon the exclusive control they Great Britain of the Upper Nile Valley, and also upon the retention of Uganda. In 1893 the question of Siam came near to causing serious trouble with France, but by the exercise of a combination of firmness and forbearance on Lord Rosebery's part the crisis was averted, and the lines were laid down for preserving Siam, if possible, as a buffer state between the English and French frontiers in Indo-China. In the spring of 1895 he was clear-sighted enough to refuse to join the anti-Japanese League of Russia, France and Germany at the end of the China-Japan War.

Lord Rosebery's personal popularity had been increased at home by his successful intervention in the coal strike of December 1893, and when in March 1894 the resignation of Gladstone was announced, his selection by Queen Victoria for the premiership was welcomed by the public at large and by the majority of his own party. On all hands he was then considered dignus imperii—"it was only as the new administration went to pieces that people began to add mist to imperi." The conditions he had to face were by no means hopeful. The Liberal majority of 44 was already dwindling away, and the malcontents, who considered that Sir William Harcourt should have been the prime minister, or who were perpetually intriguing against a leader who did not satisfy their idea of Radicalism, made Lord Rosebery's personal position no easy one. A systematic policy of economy was pursued by the Radical party, who objected to a peer premier as such, and a great deal of adverse criticism was also aroused by a speech in which the prime minister, taunted for not again bringing forward a Home Rule measure, insisted upon the truism that the conversion of England, the "predominant partner," was a necessary condition of success. The support of the Irish Nationalists was by no means secure. Lord Rosebery's foreign policy, moreover, was too Tory for his Radical followers; he insisted upon "continuity of policy in foreign affairs," which meant carrying on the Conservative policy and not upsetting it. The premier was thought to have shown a restlessness and a rawness at the touch of censure which did not increase his reputation for reserve power or strength, but this was undoubtedly due in large measure to the recrudescence of the insomia from which he had suffered in 1891. The government effected little. In Mr Asquith's phrase, it was only "ploughing the sands." The Parish Councils Act was only passed by compromising with the Opposition. Local Veto and Disestablishment of the Welsh Church were put in the forefront of the party programme, but the government was already to all appearances riding for a fall, when on the 24th of June 1895 it was beaten upon an adverse vote in the Commons in regard to a question of the supply and reserve of small arms ammunition.

The general election which followed after Lord Salisbury had formed his new ministry was remarkable for the undiscliplined state of the Liberal party. At the Eighty Club and the Albert Hall Lord Rosebery advised them to concentrate upon the reform of the House of Lords, that assembly being, as he said, a foremost obstacle to the passing of legislation on the lines of the Newcastle programme; but he was unable to suggest in what direction it should be reformed. Sir William Harcourt and Mr John Morley, on the other hand, continued respectively on Local Option and Home Rule. The Liberals were quarrelling among themselves, and the result was an overwhelming defeat. In Opposition Lord Rosebery was now at a serious disadvantage as head of a parliamentary party; for in any case he could not rally them as a loyally followed leader in the House of Commons might have done. But his followers were not all loyal, and his rivals in leadership were themselves in the House of Commons. Added to this there was still in the background the veteran statesman to whom Liberalism owed an unequivocal obligation. When the "Armenian atrocities" became a burning question in the country in 1896, and Mr Gladstone himself emerged from his retirement to advocate intervention, Lord Rosebery's difficulties had taken their final form. He declined to support this demand at the risk of a European war, and on the 8th of October 1896 he announced to the Liberal whip, Mr Thomas Ellis, his resignation of the Liberal leadership. On the following day he made a farewell speech at the Empire Theatre, Edinburgh, to over four thousand people, and for some time he held aloof from party politics, "ploughing his furrow alone," as he afterwards phrased it.

In 1898, on the death of Mr Gladstone, he paid a noble and eloquent tribute in the House of Lords to the life and public services of his old leader. He was a pall-bearer at his funeral on the 28th of May, as he had previously been at the burials of Tennyson and Millais. His influence in the country was still a strong one on personal grounds, and he came forward now and again to give expression independently to popular feeling. In the autumn of 1898 he gave valuable support to the attitude taken up by Lord Salisbury upon the Fashoda question. He was indeed bound by consistency to withstand what his own government, by the words of Sir Edward Grey, had declared would "be going on the level with France. Again, after Mr Kruger's ultimatum in October 1899, Lord Rosebery spoke upon the necessity of the nation closing its ranks and supporting the government in the prosecution of war in South Africa. After Nicholson's Nek he reiterated the resolution of the country "to see this thing through." Nevertheless, in a letter to Captain
Lambton, an unsuccessful Liberal candidate for Newcastle, in September 1900, he condemned the general conduct of affairs by Lord Salisbury's government, while in several speeches in the House of Lords he strongly urged the necessity of army reform. Since his abdication of the leadership in 1896, the lack of coherence in the Liberal party had become more and more manifest. The war had brought to the front a pro-Boer section, which seemed gradually to be compromising the whole party, and had apparently succeeded in winning the support of Sir Henry Campbell-Bannerman, the leader in the House of Commons. Lord Rosebery maintained for the most part a sphinx-like seclusion, but in July 1901 he at last came forward strongly as the champion of the Liberal Imperialist section.

In deference to the wishes of supporters such as Mr Asquith, Sir Henry Fowler and Sir Edward Grey he determined to "put his views into the common stock" at a representative meeting of Liberals held at Chesterfield in December 1901. There he advised the Liberal party that "its slate must be cleaned," and, as he subsequently explained, this cleansing must involve the elimination of Home Rule for Ireland. His appeal for "spade work" resulted in the formation of the Liberal League, inside the Liberal Opposition; and what Lord Rosebery himself described as his "definite separation" from Sir Henry Campbell-Bannerman's "tabernacle" took place. This announcement, however, was no sooner made than it was explained away by the supporters of both, and early in 1902 Lord Rosebery spoke at the National Liberal Club in a way which indicated that an understanding might still be arrived at. But though Mr Asquith and Sir Edward Grey adhered to the Liberal League, Sir Henry Campbell-Bannerman retained the loyalty of the majority of the Liberal party, and Lord Spencer threw his weight on the same side; and in a speech at the Liberal League dinner on the 31st of July Lord Rosebery had to admit that their principles had not yet prevailed, and that, until then, it would be a reconciliation between the two wings of the party would be impossible. In January 1903 he addressed a Liberal meeting at Plymouth, and appeared to be attempting to concentrate Opposition criticism upon the points in the government policy which did not involve the Imperialist difference; and in discussing the War Office reform he advocated the appointment of Lord Kitchener as secretary of state for war.

When Mr Chamberlain started his new fiscal programme, combining Tariff Reform with Colonial Preference, Lord Rosebery at first seemed inclined to treat it as non-political, and on the 19th of May 1903 he declared in an address to the Burnley Chamber of Commerce that he was not one of those who regarded Free Trade as part of the Sermon on the Mount. This utterance led to an idea that he was inclined to consider favourably the proposal for a preferential tariff, his earlier enthusiasm for Imperial Federation making his support an interesting political possibility. But this idea was quickly dispelled; on the 22nd he expressed his surprise at anybody who should consider that disinterested Parliament was competent for Mr Chamberlain's plan; he was not prepared to dismiss in advance a proposal for the consolidation of the empire made by the responsible government, but he believed that the objections to a policy of preference were insurmountable. The fact, no doubt, was that Mr Asquith, Lord Rosebery's chief lieutenant in the Liberal League, made himself from the outset a determined champion of free trade in opposition to Mr Chamberlain; and Lord Rosebery quickly came into line with the rest of the Liberal party on this question. On the 12th of June, addressing the Liberal League, he admitted that as a lifelong Imperialist it was with pain and grief that he could not support Mr Chamberlain's scheme, but the empire had been built upon free trade, and he only saw danger to the empire in these new proposals. Speaking at Sheffield on the 13th of October he criticized the scheme in more detail, and, as an Imperialist, warned the country against it, emphasizing his own ideal of the future of the empire—"a strong mother with strong children, each working out his own political and fiscal salvation." His attitude on the new issue undoubtedly affected public opinion, and helped to draw him closer to the great body of the Liberal party, who saw that their identification with the cause of free trade was doing much to remove the public distrust associated with their support of Home Rule. On the 7th of November at Leicester Lord Rosebery insisted that what the country wanted was not fiscal reform but commercial reform, and he appealed to the free-trade section of the Unionist party to join the Liberals in a united defence,—an appeal incidentally for Liberal unity which was warmly seconded ten days later by Sir Henry Campbell-Bannerman. On the 26th of November Lord Rosebery's speech on the same lines at a meeting in South London resulted in a powerful demonstration in favour of his resuming the Liberal leadership, but he made no public response. On the 10th of June 1904 he addressed a meeting of the Liberal League at the Queen's Hall, London, and sketched a programme of "sane and practical Imperialism"; but he irritated the Home Rulers by again repudiating a parliament in Dublin, and he perplexed the public generally by his adverse criticism on the popular Anglo-French Agreement, which he was the only English statesman to oppose, on the ground of its handing over Morocco to France.

At Glasgow on the 5th of December he again outlined a Liberal programme, this and other speeches all leading to the assumption that his return to active co-operation with the Liberal party in the general election—which could not be long delayed—was fairly certain. Early in 1905 this impression gained such strength and such polite references were made to one another in public by Lord Rosebery and Sir Henry Campbell-Bannerman, that his assumption of office in a Liberal ministry, possibly presided over by Earl Spencer, was confidently anticipated. But these forecasts were ultimately upset, not only by Lord Spencer's illness and his removal from the list of possible Liberal prime ministers, but by Sir Henry Campbell-Bannerman's pronouncement at Stirling in November on the subject of Irish Home Rule. Lord Rosebery had just gone down to Cornwall to make a serious speech in support of the Liberal programme, now fairly well mapped out as regards those items which represented the strong public opposition to what had been done by the Unionist government. It was believed that an understanding had been come to between his Liberal League henchmen (Mr Asquith, Sir E. Grey and Mr Haldane) and Sir Henry Campbell-Bannerman, that Lord Rosebery's co-operation was to be secured by the adoption of some formula which would temporarily take Home Rule out of the official programme as a question of practical politics. But to the general surprise and Lord Rosebery's own very evident mortification Sir Henry went a long way in his Stirling speech to nail the Home Rule colour to the mast; he did not indeed propose to introduce a Home Rule Bill, but he declared his determination to proceed in Irish legislation on lines which would lead up to the same result. Lord Rosebery abruptly broke off his campaign, decamping at Bournemouth. His position had been reduced to that of a "figure of fashion" that "battalion." From the moment the apparent recrudescence of the Liberal spirit over this question seemed to have misled Mr Ballour, who resigned office on the 4th of December, into thinking that difficulties would arise over the formation of a Liberal cabinet; but, whether or not the rumour was correct that a blunder had been made at Stirling and that explanations had ensued which satisfied Mr Asquith and Sir Edward Grey, this anticipation proved unjustified. Lord Rosebery himself, it is true, held aloft; his protest had been publicly made and he adhered to it in the absence of any public withdrawal with Sir Henry Campbell-Bannerman; but he encouraged his Liberal League supporters to be loyal to the new prime minister, and Mr Asquith, Sir E. Grey and Mr Haldane were included in the Liberal cabinet. The overwhelming Liberal and Labour victory at the general election of 1906 began a new era in the fortunes of the party, and Lord Rosebery's individuality once more sank back from any position of prominence in regard to its new programme. He remained outside party politics.
emerging only in 1909, first to attack Mr Lloyd George's budget in the country as a "revolution," and then—to the general surprise—to condemn the House of Lords in debate for rejecting it; and in 1910 (see PARLIAMENT) he appeared once more to be coming to the front, by the resolutions he carried in regard to the remodelling of the Upper Chamber, when the death of King Edward VII caused a temporary postponement of the constitutional crisis. In September 1910 he acted as head of the special mission sent to the Austrian court by George V. to announce his accession to the throne,—a selection peculiarly appropriate, and cordially welcomed as such, because of his well-known Austrian sympathies. Indeed, in the East European crisis of 1909 Lord Rosebery had taken a somewhat isolated part in vindicating the attitude of Austria and her right to annex Bosnia-Herzegovina, in opposition to the criticisms generally passed in the English press.

After his retirement, from active politics Lord Rosebery continually displayed his great qualities as a public speaker by eloquent and witty addresses on miscellaneous subjects. No public man of his time was more fitted to act as unofficial national orator; none more happy in the touches with which he could adorn a social or literary topic and charm a non-political audience; and on occasion he wrote as well as he spoke. His Pitt has already been mentioned; his Appreciations and Addresses and his Peel (containing a remarkable comment on the position of an English prime minister) were published in 1899; his Napoleon: the Last Phase—an ingenious, if paradoxical, attempt to justify Napoleon's conduct in exile at St Helena—in 1900; his Cromwell in the same year. In 1906 he published an appreciation of his old friend Lord Randolph Churchill, inspired by the publication of Mr Winston Churchill's Life of his father. In its detached yet intimate way, this is a model of the art by which a good judge of men, possessed at the same time of a just historical sense, may, from the point of view of a contemporary on the opposite side in politics, communicate the perspective of an official biography written under the limitations of official obligation, that give tone and value to the picture of an interesting personality.

Lord Rosebery's family consisted of two sons and two daughters. His eldest son, Lord Dalmeny (b. Jan. 1882), who in 1909 married a daughter of Lord Henry Grosvenor, 3rd son of the 1st duke of Westminster, entered parliament in 1906 as Liberal member for Mid Lothian, but retired in 1910; he was well known as a cricketer, representing the Surrey eleven in 1903 and 1906. The younger son, the Hon. Neil Primrose (b. Dec. 1882), took more actively than his brother to a political career, and in January 1910 was returned as a Liberal for the Wisbech division of Cambridgeshire. The elder daughter, Lady Sybil, in 1903 married Captain Charles Grant; the younger, Lady Margaret, in 1899 married the 1st earl of Crewe.

ROSECRANS, WILLIAM STARKE (1819-1898), American soldier, was born in Kingston, Ohio, on the 6th of September 1819, and graduated at the U.S. Military Academy, being appointed to the engineers. After serving (1843-45) as assistant professor at West Point, and in fort construction, he resigned (April 1845) from the army and went into business in Cincinnati. On the outbreak of the Civil War Rosecrans volunteered for service under McClellan and helped raise the Ohio "Home Guards," with which he served in the West Virginia operations of 1861 in the rank of brigadier-general. He was second in command to McClellan during this campaign, and succeeded to the command when that officer was called to Washington. In the latter part of 1861 Rosecrans conducted further operations in the same region with great skill and success, and early in 1862 he was transferred to the West as a major-general of volunteers. He took part in the operations against Corinth, and when General John Pope was ordered to Virginia, Rosecrans took over command of the Army of the Mississippi with which he fought the successful battles of Chickamauga and Corinth. Soon afterwards he was ordered to replace D. C. Buell in command of the forces, renamed the Army of the Cumberland about the same time.

In December he advanced against General Braxton Bragg, and on the 31st of December to the 3rd of January was fought the bloody and indecisive battle of Stone River (Murfreesboro), after which Bragg withdrew his army to the southward. In 1863 Rosecrans, refusing to advance until the isolation of Vicksburg (farther west) was assured, did not take the offensive until late in June. The operations thus begun were most skilfully conducted, and Bragg was forced back to Chattanooga (q.v.), whence he had to retire on being once more outmanoeuvred. But Rosecrans sustained a great defeat at the battle of Chickamauga (q.v.), and was soon besieged in Chattanooga. He was then relieved from his command. Later he did good service in Missouri, and in March 1865 he was made brevet major-general U.S.A. He resigned in 1867, and in the following year became minister to Mexico. Subsequently he was engaged in many railway and industrial enterprises in that country, as also in California. He was a representative in Congress from California, 1881-85, and register of the treasury, 1885-93. Under an Act of Congress he was on the 2nd of March 1889 restored to the rank of brigadier-general, and retired. He died at his residence in Washington on the 17th of May 1902 his body was reinterred with military honours in the National Cemetery at Arlington, in the presence of President Roosevelt, members of the cabinet and many of his campaigning comrades.

ROSEGGER, PETER (1843-1935), Austrian poet and novelist, known down to 1894 under the pseudonym Petri Kettenfeuer, was born at Alpl near Krieglaich in Upper Styria, on the 31st of July 1843, the son of a peasant. Until his seventeenth year he was employed as a farm hand and received no regular school education, though he learnt reading and writing from a retired schoolmaster who lived near. Unfit, owing to physical weakness, for the hard labour of agriculture, he was apprenticed to a journeyman tailor, and on his wanderings employed his leisure hours in educating himself. He soon composed poems and wrote stories. Some of these productions he sent in 1864 to Dr. Svoboda, the editor of the Graz Tagespost, who, recognizing Rosegger's extraordinary talent, interested himself in the youth, author, and with the assistance of friends enabled him to study (from 1865-69) at the Handelsakademie of Graz. In 1869, encouraged by Robert Hamerling, Rosegger published his first work, a volume of poems in Styrian dialect, Zither und Hochbrett, which immediately established his reputation. As a result, the provincial diet of Styria accorded him a substantial stipendium (scholarship) for three years, which enabled him to supplement his studies by foreign travel. He now devoted himself entirely to authorship, and in 1876 founded the monthly periodical Der Heimgarten. On the occasion of the centenary of its reorganization the University of Heidelberg conferred upon him, in 1903, the honorary degree of doctor of philosophy.

Rosegger is one of the most fertile authors of recent times. His fresh natural style, sound judgment and his fascinating descriptions of Alpine scenery and the life of its inhabitants have made him one of the most popular authors of Austria and Germany. These characteristics are displayed to great advantage in Die Schriften des Waldschneiders (1875), Aus meinem Handwerkerleben (1880), Alpen-Trachtenbild (1882), Johann Nepomuk Bohnenberger derer Hofmuseums-Staatssekreter Mann und Weib (1879), while his simple religious mind is shown in Mein Himmelsreich (1901), Erlsegen (1900) and Das ewige Licht (1887), and his attachment to friends in Gute Kameraden (1890), Der wichtigste Mann (1893) and Der Freiherr von Münchhausen (1894). Among his other works may be mentioned a volume of poems, Gedichte (1901), a popular play, Am Tage des Gerichts (1892), two books for boys, Waldferien (1887) and Waldjungfer (1900), and the successful novel, Der abenteuerliche Nandor, which appeared in 1904 under the title Frohe Botschaft eines armen Sünders (1905), which has also been translated into English. He has also written several works which are autobiographical in character, such as Waldheimat (1873) and Mein Leben (1887).

Rosegger's Ausgewählte Schriften appeared in thirty volumes (1881–94); a popular edition (1895–1900); his Schriften in steirischer Mundart (3 vols., 1894–96). See also A. V. Svoboda, P. K. Rosegger (1886); A. Stern, Studien zur Literatur der Gegenwart (1898); and H. Möbius, P. Rosegger (1903).

ROSELLINI, IPPOLITO (1800–1845), Italian Egyptologist, was born at Pisa. He studied under Mezzofanti at Bologna, and
in 1824 became professor of oriental languages at Pisa University. He is best known as the associate of J. F. Champollion (p. 1), whose studies he shared and whom he accompanied in his Egyptian explorations (1828). On the death of Champollion, the publication of the results of their expedition fell to Rosellini (Monumenti dell’Egitto e della Nubia, Florence, 1832-40, 10 vols. fol.).

**ROSEMARY** botanically *Rosmarinus*, a Labiate plant, the only representative of the genus and a native of the Mediterranean region. It is a low shrub with linear leaves, dark green above, white beneath, and with margins rolled back on to the under face. The flowers are in small axillary clusters. Each has a two-lipped calyx, from which projects a bluish two-lipped corolla enclosing two stamens, the other two, which are generally present in the family, being deficient. The fruit consists of four smooth nutlets. Botanically the genus is near to *Salvia*, but it differs in the shorter connective to the anther. Rosemary was highly esteemed by the ancients for its aromatic fragrance and medicinal uses. In modern times it is valued mainly as a perfume, for which purpose the oil is obtained by distillation. It doubtless has slight stimulant properties, such as are common to all volatile oils, which may account for the general belief in the efficacy of the plant in promoting the growth of the hair. Rosemary plays no unimportant part in literature and folklore, being esteemed as an emblem of remembrance. 'There's rosemary, that for remembrance,' says Ophelia. Its connexion with funeral rites is not extinct in country places to-day. It was formerly much valued at wedding festivities. The name "ros marinus" or "ros marii," literally "sea-dew," was probably given in allusion to its native habitat in the neighbourhood of the sea.

**ROSENHEIM**, a town and watering-place of Germany, in the kingdom of Bavaria, situated at the confluence of the Mangfall and the Inn, 40 m. by rail S.E. of Munich. Pop. (1903) 15,403. It is an interesting town, with many medieval houses. Among its seven churches the Roman Catholic parish church, with a curious cupola and containing numerous old tombs and effigies, and that of the Holy Ghost (15th century), are remarkable. There are a monastery, two convents, several schools and a hospital. Rosenheim is frequented for its saline and sulphur baths, and there are important saltworks, the brine being conveyed from Reichenhall in pipes; it has also machine factories, metalworks and breweries. Cordage is manufactured, and there is a trade in cattle and grain. Although founded in the 12th century Rosenheim did not become a town until 1864.

**ROSENKRANZ, JOHANN KARL FRIEDRICH** (1805-1879), German philosopher, was born at Magdeburg on the 23rd of April 1805. He read philosophy at Berlin, Halle and Heidelberg, devoting himself mainly to the doctrines of Hegel and Schleiermacher. After holding the chair of philosophy at Halle for two years, he became, in 1833, professor at the university of Königsberg, where he remained till his death on the 14th of July 1879. In his last years he was quite blind. Throughout his long professorial career, and in all his numerous publications he remained, in spite of occasional deviations on particular points, loyal to the Hegelian tradition as a whole. In the great division of the Hegelian school, he, in company with Michaelis and others, formed the "centre," midway between Erdmann and Gabler on the one hand, and the "extreme left" represented by Strauss, Feuerbach and Bruno Bauer.

Of his numerous writings, the following may be mentioned:— 1. *Kritik der Hegel'schen Geschichte der Weltliteratur* (1836); 2. *Psychologie oder Wissenschaft vom subjektiven Geist* (1837); 3rd ed., 1863); 3. *Kritische Erläuterungen des Hegelschen Systems* (1840); 4. *Vorlesungen über Schelling* (1842); 5. *System der Wissenschaft* (1846); 6. *Meine Reform der Hegelschen Philosophie* (1852); 7. *Wissenschaft der logischen Idee* (1858-60), with a supplement (Epilogena, 1862); 8. *Hegels Naturphilosophie und die Bearbeitung derselben durch Vera* (1868); 9. *Erläuterungen zu Hegels Encyclopädie der philosophischen Wissenschaften* (1871). Two other of his works on Hegel are important, the *Lösen Hegels* (1844) and the *Hegel als deutscher Nationalphilosoph* (1870). Between 1838 and 1840 in conjunction with F. W. Schubert, he published an edition of the works of Kant, to which he appended a history of the Kantian doctrine.

ROSENTHAL, TOBY EDWARD (1848— ), American artist, was born at New Haven, Connecticut, on the 15th of March 1848. Removing to San Francisco with his parents in 1855, he there studied painting under Fortunato Arriola. In 1865 he went to Munich, where he was a pupil of the Royal Academy under Strachuber, Raupp and Piloty. Among his more important works are: "Morning Prayers" (Leipzig Museum), "Elaine," "Trial of Constance de Beverley," "Dancing Lesson During the Empire" and "Departure from the Family."

**ROSES, WARS OF THE**, a name given to a series of civil wars in England during the reigns of Henry VI., Edward IV. and Richard III. Their importance in the general history of England is dealt with elsewhere, and their significance in the history of the art and practice of war is small. They were marked by a ferocity and brutality which are practically unknown in the history of English wars before and since. The honest yeoman of Edward III.'s time had evolved into a professional soldier of fortune, and had been demoralized by the prolonged and dismal Hundred Years' War, at the close of which many thousands of ruffians, whose occupation had gone, had been let loose in England. At the same time the power of feudality had become concentrated in the hands of a few great lords, who were wealthy enough and powerful enough to become king-makers. The disbanded mercenaries enlisted indifferently on either side, corrupting the ordinary feudal tenantry with the evil habits of the French wars, and pillaged the countryside, with accompaniments of murder and violence, wherever they went. It is true that the sympathies of the people at large were to some extent enlisted: London and, generally, the trading towns being Yorkist, the country people Lancastrian—a division of factions which roughly corresponded to that of the early part of the Great Rebellion, two centuries later, and similarly in a measure indicative of the opposition of hereditary loyalty and desire for sound and effective government. But there was this difference, that in the 15th century the feeling of the masses was to a great extent focused upon the great lords. Each lord could depend on his own tenantry, and he could, further, pay large bands of retainers. Hence, much as the citizen desired a settlement, the issue was in the hands of the magnates; and as accessions to and defections from one party and the other constantly shifted the balance of power, the war dragged on, becoming more and more brutal with every campaign.

It is from the Wars of the Roses that there originated the deep-rooted dislike of the professional soldier which was for nearly four centuries a conspicuous feature of the English social and governmental system, and it is therefore in their results rather than their incidents that they have affected the evolution of war. They withdrew the English army system from European battlefields precisely at the moment of transition when the regimental and technical organization of armies was becoming a science and seeking models, and the all-powerful English longbow at the moment when the early, scarcely effective firearms were, so to speak, struggling for recognition as army weapons. On the other hand, they destroyed the British military organization. The national army, aloof from the main streams of military progress, remained for 150 years an aggregation of county levies armed with bills and bows. In so far as the king was permitted or able to raise armies, they were small mercenary forces formed, on a basis of unemployed professionals, from pressed men and criminals, and they were
disbanded as soon as the brief occasion for their services had passed.

The first campaign, or rather episode, of these wars began with an armed demand of the Yorkist lords for the dismissal of the Lancastrian element in the king's council, Henry VI. himself being incapable of governing. The Lancastrians, and the king with them, marched out of London to meet them, and the two small armies (3000 Yorkists, 2000 Lancastrians) met at St Albans (May 22, 1455). The encounter ended with the dispersion of the weaker force, and the king fell into the hands of the Yorkists. Four years passed before the next important battle, Bradewich, was fought (Sept. 29, 1456). In this the earl of Salisbury trapped a Lancastrian army in unfavourable ground near Market Drayton, and destroyed it; but new political combinations rendered the Yorkist victory useless and sent the leaders of the party into exile. They made a fresh attempt in 1460, and, thanks partly to treason in the Lancastrian camp, partly to the generalship of Warwick, won an important success and for the second time seized the king at Northampton (July 10, 1460). Shortly afterwards, after a period of negotiation and threats, there was a fresh conflict. Richard duke of York, now the head of the hostile army which gathered at York and consisted of Lancashire and Midland Royalists, while his son Edward, earl of March, went into the west. The father was ambushed and killed at Wakefield (Dec. 30, 1460), and the Lancastrians, inspired as always by Queen Margaret of Anjou, moved south on London, defeated Warwick at St Albans (Feb. 17, 1461), and regained possession of the king's person. But the young earl of March, now duke of York, having raised an army in the west, defeated the earl of Pembroke (Feb. 1461) at Mortimer's Cross (5 m. W. of Leominster). This was the first battle of the war which was characterized by the massacre of the common folk and beheading of the captive gentlemen—invariable accompaniments of Edward's victories, and conspicuously absent in Warwick's. Edward then pressed on, joined Warwick, and entered London, the army of Margaret retreating before them. The excesses of the northern Lancastrians in their advance produced bitter fruit on the retreat, for men flocked to Edward's standard. Marching north in pursuit, the Yorkists brought their enemy to bay at Towton (g.s.), 3 m. in March 1461. Thereafter no more successes were achieved. For three years after Towton the war consisted merely of desultory local struggles of small bodies of Lancastrians against the inevitable. The duke of York had become King Edward IV., and had established himself firmly. But in 1464, in the far north of England, the Red Rose was again in the field. Edward acted with his usual decision. His lieutenant Montagu (Warwick's brother) defeated and slew Sir Ralph Percy at Hedghley Moor, near Wolow (April 25, 1464), and immediately afterwards destroyed another Lancastrian army, with which were both Henry VI. and Queen Margaret, at Hexham (May 8, 1464). The massacres and executions which followed effectively crushed the revolt. For some years thereafter Edward reigned peacefully, but Warwick the king-maker and all the Neville following having turned against him (1470), he was driven into exile. But at a favourable moment he sailed from Flushing with 1500 retainers and Burgundian mercenaries, and eluding the Lancastrian fleet and the coast defence troops, landed at Ravenspur (Spurn Head) in Yorkshire in March 1471. His force was well advised to have a bodyguard; the gates of the towns were shut against him, and the country people fled. But by his personal charm, diplomacy, fair promises and an oath of allegiance to King Henry VI., sworn solemnly at York, he disarmed hostility and, eluding Montagu's army, reached his own estates in the Wakefield district, where many of his old retainers joined him. As

1 The name, as is well known, comes from the "white rose of York" and the "red rose of Lancaster"; but these badges, though more or less recognized as party distinctions, by no means superseded the private devices of the various great lords, such as the "falcon and falconer" of Richard duke of York, the "rose in sun" of Edward IV., the "crowed swan" of Margaret, the Vere star, and even the revived "white hart" of Richard II. he advanced south, a few Yorkist nobles with their following rallied to him, but it was far more the disunion of the Warwick and the real Lancastrian parties than his own strength which enabled him to meet Warwick's forces in a pitched battle. At Barnet, on Easter Eve, April 14, 1471, the decisive engagement was fought. But in the midst of the battle reinforcements coming up under the earl of Oxford to join Warwick came into conflict with their own party, the badge of the Vere star being mistaken for Edward's Rose-en-soleil. From that point all the mutually distrustful elements of Warwick's army fell apart, and Warwick himself, with his brother Montagu, was slain. For the last time the unhappy Henry VI. fell into the hands of his enemies. He was relegated to the Tower, and Edward, disbarding his army, reoccupied the throne. But Margaret of Anjou, his untriring opponent, who had been in France while her cause and Warwick's was being lost, had landed in the west shortly after Barnet, and Edward had to take the field at once. Assembling a fresh army at Windsor, whence he could march to interpose between Margaret and her north Welsh allies, or directly bar her road to London, he marched into the west on the 24th of April. On the 29th he was at Cieno, Margaret, engaged with a, thinly in recruiting an army, near Bithwa. What hurried on, but Margaret eluded him and marched for Gloucester. At that place the governor refused the Lancastrians admittance, and seeking to cross the Severn out of reach of the Yorkists, they pushed on by forced marches to Tewkesbury. But Edward too knew how to march, and caught them up. The battle of Tewkesbury (May 4, 1471) ended with the destruction of Margaret's force, the captivity of Margaret, the death of her son Edward (who, it is sometimes said, was stabbed by Edward IV. himself after the battle) and the execution of sixteen of the principal Lancastrians.

This was Edward's last battle. The rest of his eventful reign was similar in many ways to that of his contemporary Louis XI., being devoted to the consolidation of his power, by fair means and foul, at the expense of the great feudalatories. But the Wars of the Roses were not yet at an end. For fourteen years, except for local outbreaks, the land had peace, and then Richard III.'s crown, struck from his head on Bosworth Field (Aug. 22, 1485), was presented to Henry earl of Rich- mond, who, as Henry VII., established the kingdom. A last feeble attempt to renew the war, made by an army gathered to uphold the pretender Lambert Simnel, was crushed by Henry VII. at Stoke Field (4 m. S.W. of Newark) on the 16th of June 1487.

ROSETTA (Coptic Raskit, Arabic Roskat), a town situated at the western or "Rosetta" mouth of the Nile on the west bank. It was called Bolbitine by the Greeks, but according to Herodotus the Bolbitine mouth was artificial, and it was evidently of little importance compared with the Canopic, Sebeiyntic and Pelusiac mouths. When the other branches and the Alexandria channel silted up, Rosetta prospered like its sister port of Damietta on the eastern branch; the main trade of the overland route to India passed through it until Mehmet Ali cut a new canal joining Alexandria to the Nile. Rosetta is now much decayed. Its population in 1907 was 16,810, almost entirely Mussulman. A railway joins it to Alexandria. The celebrated Rosetta Stone which supplied Champollion with the key for decipherment of the ancient monuments of Egypt was found near Fort St Julien, 4 m. N. of the town in 1799, by Boussard, a French officer. It is a basalt stele inscribed in hieroglyphic, demotic and Greek with a decree of the priests assembled at Memphis in favour of Ptolemy V. Epiphanes. It was ceded to the English at the capitulation of Alexandria (1801) and is now in the British Museum. See EGYPT: II. Ancient Egypt, section D. "Writing." (F. L., G.)

ROSEWOOD, the name given to several distinct kinds of ornamental timber. That, however, so called in the United Kingdom is Brazilian rosewood, the polissandre of the French, the finest products of which, coming from the provinces of Rio de Janeiro and Bahia, are believed to be the produce principally of Dalbergia nigra, a leguminous tree of large dimensions,
called *cabionia* and *jacaranda* by the Brazilians. The same
name, jacaranda, is applied to several species of *Machaerium*,
also trees belonging to the natural order Leguminoseae; and
there can be no doubt that a certain proportion of the rosewood
of commerce is drawn from these sources. Rosewood comes to
the United Kingdom from Rio de Janeiro, Bahia, Jamaica and
Honduras. The heartwood attains large dimensions, but as it
begins to decay before the tree arrives at maturity it is always
faulcy and hollow in the centre. On this account squared
logs or planks of rosewood are never seen, the wood being
imported in half-round fitches 10 to 20 ft. in length and from
5 to 12 in. in their thickest part. Owing to its irregular form,
the wood is sold by weight, and its value varies within wide
limits according to the richness of colour. Rosewood has a
deep ruddy brown colour, richly streaked and stained with
black resinous layers. It takes a fine polish, but, on account of
its resinous nature, it is not grained to the same extent as
other wood is very much in demand both by cabinet-makers and
pianoforte-makers, by whom it is used both solid and in veneer.
The wood of *Dalbergia latifolia*, a native of the East Indies, used
for ornamental furniture and carvings under the name of blank
wood, is frequently termed East Indian Rosewood. The *Bois de
Rose* of the French, the *Portuguesa Pao de Rosa*, and the *German
Rosewood* is Brazilian wood, the produce of *Physoclysummum
floribundum*, called in the United Kingdom tulip wood, and
very highly esteemed on account of its beautiful rose colour and
grain.

**ROSICRUCIANISM.** What is known as the Society of
Rosicrucians (Rosenkreuzer) was really a number of isolated
individuals who early in the 17th century held certain views in
common (which appeared to them only by means of a few
letters passed between them in assistant secret societies), and
for which they held regular meetings, and having officers, there is
no trace. So far as the numerous works are concerned it is
evident that the writers who posed as Rosicrucians were moral
and religious reformers, and utilized the technicalities of
chemistry (alchemy), and the sciences generally, as media
through which to make known their opinions, there being a
flavour of mysticism or occultism promotive of inquiry and
suggestive of hidden meanings discernible or discoverable
only by adepts.

The publication of the *Allgemeine und General-Reformation
der ganzen weiten Welt* (Cassel, 1614), and the *Fama Fraternitatis*
(Cassel, 1615) by the theologian Johann Valentin Andreae
(1586–1654), caused immense excitement throughout Europe,
and they not only led to many re-issues, but were followed by
numerous pamphlets, favourable and otherwise, whose
authors generally knew little, if anything, of the real aims of
the original authors and doubtless in not a few cases amused
themselves at the expense of the public. It is probable that
the first work was circulated in MS. about 1610, for it is said
that a reply was written in 1612 (according to Herder), but
if so, there was no mention of the cult before that decade.
The authors generally favoured Lutheranism as opposed to
Roman Catholicism. Others, like John Heydon, admitted
they were not Rosicrucians, but under attractive and sug-
gestive titles to their works sought to make Hermeticism and
other curious studies more useful and popular, and succeeded,
for a time at least.

The curious legend, in which the fabulous origin of the
so-called society was enshrined (that a certain Christian Rosen-
kreuzez had discovered the secret wisdom of the East on a pilgrim-
age in the 15th century), was so improbable, though ingenious,
that the genesis of the Rosicrucians was generally overlooked
or regarded as a flimsy story; but the worthy objects of the fraters
were soon discovered and supported by several able men; the result
being a mass of literature on the subject, which absorbs some
80 pages of Gardner’s *Catalogue Raisonné of Works on the Occult
Sciences* (London, 1903).

The influence that Rosicrucianism had in the modernizing of
ancient Freemasonry early in the 18th century must have been
slight, if any, though it is likely that as the century advanced,
and additional ceremonies were grafted on to the old tenets of
Rosicrucian testes were occasionally introduced into the later
rituals. So far, however, as the real foundation ceremonies of Craft
Masonry are concerned, whether before or after the premier Grand
Lodge was formed, it is most unlikely that such a society as the
Freemasons would adopt anything of a really distinctive character
from any other organization.

The *Mas’ Threnodie* by H. Adomson (Perth, 1638) are the lines—
"For we do prease is riot in grosse,
For we are brethren of the Rosie Cross;
We have the same opinion, and slight,
Things for to come we can fortell aright."

Dr Begemann considers that possibly during the decade from 1720
to 1730 a kind of Rosicrucian or Hermetic influence took place in
the lodges of London, some additions to the ritual of that period
having been derived from Rosicrucian sources, but that in the
previous century no such influence is traceable. Several modern
societies have been formed from time to time (some of which are
still flourishing in Great Britain) for the study of Rosicrucianism
and all Rosicrucian subjects, but in none of these are they directly derived from
the "Brethren of the Rosy Cross" of the 17th century, though keen followers thereof.
By far the most important of these is the "Societas Rosicruciana in Anglia," with headquarters in London. The
*Supreme Magus*, Dr William Wynn Westcott, has written its *History* (1900), and other important works on the subject, and the
published *Transactions* of the Society are most valuable.

The Rosicrucians, *their Rites and Mysteries*, by Hargrave Jennings
(three editions, 1870–89); the *Real History of the Rosicrucians,
and other Memorable Events connected with the Society*, collected from the Writings of Initiated Brethren, by A. E. Waite
(1887); and *The Arcane Schools*, by John Yarker (1905), may be
consulted with advantage, though not authorized publications of the Society.

**ROSIN** (a later variant of "resin," q.v.) or *Colophony* (*Colo-
phonii resina*, resin from *Colophon in Lydia,* the resinosous
portion of the tree of the same name) was originally derived
from resin of pine, *Pinus sylvestris*, and is known in commerce as crude turpentine. The separation of the oleo-resin into the essential oil-spirit of turpentine and common rosin is effected by distillation in large copper stills.
The essential oil is carried off at a heat of between 212° and
316° F., leaving fluid rosins, which is run off through a tap
at the bottom of the still, and purified by passing through a
straining wadding. Rosin varies in colour, according to the
age of the tree whence the turpentine is drawn and the amount
of heat applied in distillation, from an opaque almost pitchy
black substance through grades of brown and yellow to an
almost perfectly transparent colourless glassy mass. The
commercial grades are numerous, ranging by letters from A, the darkest, to N, extra pale—superior to which are W, "window glass," and WW, "water white" varieties, the latter having about three times the value of the common quali-
ty. Rosin is a hard, flinty friable resin, with a faint piny
dour; the melting-point varies with different specimens,
some being semi-fluid at the temperature of boiling water,
while others do not melt till 220° or 250° F. It is soluble in
alcohol, ether, benzene and chloroform. Rosin consists mainly
of abietic acid, and combines with caustic alkalies to form
salts (rosinates or pineates) that are known as "resin soaps."
In addition to its extensive use in soap-making, rosin is largely
employed in making inferior varnishes, sealing-wax and various
cements. It is also used for preparing shoemaker’s wax, as
a flux for soldering metals, for pitching lager beer casks, for
rosining the bows of musical instruments and numerous minor
purposes. In pharmacy it forms an ingredient in several
plasters and ointments. On a large scale it is treated by
destructive distillation for the production of rosin spirit,
pinoline and rosin oil. The last enters into the composition
of some of the solid lubricating greases, and is also used as an
adulterant of other oils.

The chief region of rosin production is the South Atlantic
and Eastern Gulf states of the United States. American
rosin is obtained from the turpentine of the swamp pine, *Pinus
australis*, and of the lobolly pine, *P. Taeda*. The main source of
supply in Europe is the “lands” of the departments of Gironde and Landes in France, where the落 cluster pine,
*P. Pinaster*, is extensively cultivated. In the north of Europe
rosin is obtained from the Scotch fir, *P. sylvestris*, and through-
out European countries local supplies are obtained from other
species of pine.
ROSKILDE, or Roskilde, a town of Denmark in the amt (county) of Kjøbenhavn (Copenhagen), 20 m. by rail W. of Copenhagen, on the great lagoon-like inlet named Roskilde Fjord. Pop. (1901) 83,682. It has a small port, and is an important railway junction, from which lines diverge W., S.W. and S. through the island of Zealand. Its interest, however, is historical. It was the capital of the kingdom until 1443, and the residence of the bishops of Zealand until the Reformation. The cathedral, a beautiful church, was consecrated in 1084, but of this early building only foundation walls remain; the present structure of brick was begun in 1215, and enlarged and restored at various later dates. It stands in relation to Danish history somewhat as Westminster Abbey does to English, containing the tombs of most of the Danish kings from Harold I. (987). The most noteworthy architectural details are the Chapel of the Trinity (15th century) and that of Christian IV. (Renaissance, 1617), carved choirs, and an altar-piece of the 16th century. Other old buildings are a church of Our Lady, dating as it stands from 1242, a diocesan library (partly of the 15th century), royal palace (1735) and institute for daughters of noblemen (1790).

ROSMAN, HERCULES GEORGE ROBERT ROBINSON, 1st BARON (1824-1897), British colonial administrator, was born December 1, 1824, and died at Pavia (1797-1855), was the son of Sir Robert Robinson, for many years a Member of Parliament. He was educated at Eton College and St. John's College, Cambridge, and entered the service of the East India Company as a private in the 71st Foot in 1846. He was appointed secretary to the governor of the Cape of Good Hope in 1848, and subsequently became chief commissioner of the Cape. In 1855 he was appointed governor of the Cape of Good Hope, and in 1859 he was knighted for his services in the Transvaal War. He was raised to the peerage as Baron Rosmead, County Westmeath, in which he afterwards took his title. He was appointed governor of the Cape of Good Hope in 1855 and died in 1870.

ROSMINI-SERBATI, ANTONIO (1797-1855), Italian philosopher, was born at Rovereto in Italian Tirol on the 25th of March 1797. He belonged to a noble and wealthy family, but at an early age decided to enter the priesthood. After studying at Pavia and Padua, he took orders in 1821. In 1826 he founded the first of his religious orders, the Institute of the Brethren of Charity, known in Italy generally as the Rosminians. The members might be priests or laymen, who devoted themselves to preaching, the education of youth, and works of charity-material, moral and intellectual. They have branches in Italy, England, Ireland, France and America. In London they are attached to the Church of St. Etheldreda, Ely Place, Holborn, where the English translation of Rosmini's works is edited. His works, The Five Wounds of the Holy Church and The Constitution of Social Justice, aroused great opposition, especially among the Jesuits, in 1849 they were placed upon the Index. Rosmini at once declared his submission and retired to Stressa on Lago Maggiore, where he died on the 1st of July 1855. Before his death he had the satisfaction of learning that the works in question were dismissed, that is, proclaimed free from censure by the Congregation of the Index. Twenty years later, the word "dismissed" (dimittitur) became the subject of controversy, some maintaining that it amounted to a direct approval, others that it was purely negative and did not imply that the books were free from error. The controversy continued till 1887, when Leo XIII. finally condemned forty of his propositions and forbade their being taught.

In 1848 Rosmini took part in the struggle which had for its object emancipation from Austria, but he was not an initiator of the movement which ended in the freedom and unity of Italy. In fact, while eager for the deliverance of Italy from Austria, his aim was to bring about a confederation of the states of the country, which was to be under the control of the pope.
The most comprehensive view of Rosmini's philosophical standpoint is to be found in his *Sistema filosofico*, in which he set forth the conception of a complete encyclopaedia of the human knowable, synthetically conjected, according to the order of ideas, in a perfectly harmonious and comprehensive position of recent philosophy from Locke to Hegel, and having his eye directed to the ancient and fundamental problem of the origin, truth and certainty of our ideas, he wrote: "If philosophy is to be restored to love and respect for reason, it must return to the roots of the ancients, and in part to give those teachings the benefit of modern methods" (Theodicy, n. 148). He examined and analysed the fact of human knowledge, and obtained the following results: (1) that the notion or idea of being or having is fundamental, as the substrate of all objectivity, and is presupposed by, all our acquired cognitions, so that, without it, they would be impossible; (2) that this idea is essentially objective, inasmuch as what is seen in it is as distinct from and opposed to that which sees it, and is the light by which we are enlightened, objectified; (3) that it is essentially true, because "being" and "truth" are convertible terms, and because in the vision of it the mind cannot err, since error could only be committed by a judgment, and here there is nothing, but a pure intuition affirming nothing and denying nothing; (4) that by the application of this essentially objective and true idea the human being intellectually perceives, first, the animal body individually conjoined with him, and then, on occasion of the sensations produced in him not by himself, the causes of those sensations, that is, from the action felt he perceives and affirms a being, a being, and therefore a thing, that acts on him, and he thus gets at the external world,—these are the true ideas of the body, the substratum of the body, the individual particular being (subject), and (b) its essence or species as determined by the quality of the action felt from it (predicate); (5) that reflection, by separating the essence or species from the subsistence, obtaining the abstract idea, is the fundamental idea of all the rest of true knowledge, by leaving aside some of its elements, the abstract specific idea (abstraction); (6) that the mind, having reached this stage of development, can proceed to further and further abstractions, including the abstract general idea, and the general idea of the ideas, the great complex ideas, groups of ideas, and so on without end; (7) finally, that the same most universal idea of being, this generator and formal element of all acquired cognitions, cannot itself be acquired, but must be given to us individually and each man must sensualize the natural shinning to our mind, must therefore be what men call the light of reason. Hence the name Rosmini gives it of ideal being; and this he laid down as the fundamental principle of all philosophy and of the certainty of truth; and Rosmini did not abandon to be the teaching of St Augustine, as well as of St Thomas, of whom he was an ardent admirer and defender.

Of his numerous works, of which a collected edition in 17 volumes was issued at Milan (1842-44), supplemented by Opere poste in 5 vols. (Turin, 1859-74), the most important are the *New Essay on the Origin of Ideas* (Eng. trans., 1883); *The Principles of Moral Science* (1881); *The Restoration of Philosophy in Italy* (1856); *The Philosophy of Locke* (1857); *The Philosophy of Lockhart* (1858); *The Ruling Principle of Method Applied to Letters*, by Mrs W. Green (London, 1880); *Maxims of Christian Perfection*, by W. A. Johnson (London, 1880); *The Christian Philosophy*, by Lockhart (1882); *The Evolution of Philosophy*, by Lockhart (1882); *The Religion of Man* (Eng. trans., 1883); *Philosophy*, by Lockhart (1882); *The Ruling Principle of Method Applied to Letters*, by Mrs W. Green (Boston, Mass., 1887); *Select Letters*, by D. Gazzola. Rosmini's *Sistema filosofico* has been translated into English by Thos. Davidson (Rosmini's Philosophical System, 1882, with a biographical sketch and complete bibliography); see also *Lives of G. S. Macalister* (1883) and G. B. Pagani (1907); C. Wernher, *Die Italienische Philosophie des 10. Jahrhunderts* (1884); F. X. Kraus, "Antonio Rosmini: sein Leben und Werk," in *Deutsche Rundschau*, liv. iv. (1888); "Church Reformation in Italy" in the *Edinburgh Review*, cxvi. (July 1861); and numerous recent Italian works, for which Baldwin's *Dictionary of Philosophy or Pagliani's Catalogo Generale* (Milan, 1905) should be consulted.

ROSNEY, JOSEPH HENRY, a pseudonym covering the collaboration of the French novelists, Joseph Henri Honore Boeck, born at Brussels in 1856, and his brother Séraphin Jean François Boeck, born at Brussels in 1839. The novels of J. H. Rosney are full of scientific knowledge, of astronomy, anthropology, zoology and, above all, philosophy and are appealing to the point of view of society rather than of the individual, but the characters, strongly individualized and intensely real, are only incidentally typical. The elder Rosney was the sole author of the earlier novels, and began novel-writing as an avowed disciple of Zola. *Nell Horne, membre de l'armée du salut* (1885) is a picture of London life and social reform; *Le Bilatral* (1886) and *Marc Fane* (1888) describe the revolutionary and anarchist parties of Paris; *L'Immolation* (1887) is a brutal story of peasant life; *Le Terme* (1890) is a picture of literary life in Paris; and *Vamire* (1891), with *Erymrah* (1893), and *Les Profondeurs de Kyano* (short stories, 1896) and others deal with prehistoric man. MM. Rosney were among the writers who in 1887 entered a formal protest in the *Figaro* against Zola's *La Terre*, and they were designated by Edmond de Goncourt as original members of his academy. Among their later novels the more famous are: *Daniel Valgamma* (1891), a study in the possibilities of personal sacrifice; *L'Impérieuse Bonh* (1894), an indictment of Parisian charity; *L'Indomptée* (1895), the history of a girl medical student in Paris; *Le Serment* (1896, dramatized 1897); *Les Ames Perdues* (1899), another anarchist novel; *La Charpente* (1900); *Thérèse Degaudy* (1902); *Le Crime du docteur* (1903); *Le Docteur Harambur* (1904); *Le Millionnaire* (1905); and *Sous le fardeau* (1906).

ROSS, ALEXANDER (1699-1784), Scottish poet, was born on the 13th of April 1699 at Kincardine-O'Neil, Aberdeenshire. He was educated at Marischal College, Aberdeen, and became tutor to the children of Sir William Forbes of Craigievar. He became in 1732 schoolmaster of Lochlee, Angus, where the rest of his life was spent. He had long been in the habit of writing verse for his own amusement, when in 1768 he published, at the suggestion of James Beattie, *The Fortunate Shepherd . . . to which is (sic) added a few songs*. This is a pastoral narrative poem, written in obvious imitation of Allan Ramsay's *Gentle Shepherd*. Its affections are chiefly on the surface. The background of shepherd life as known to Ross, and the rather sordid motives of the characters, despite their high-sounding names of Helenore, Rosalind, &c., are depicted with unconvincing truth. He died at Lochlee, and was buried on the 26th of May 1784.

See Hellenore, or the *Fortunate Shepherd*, edited by John Longmuir (1856); H. W. Webster, *Three Centuries of Scottish Literature* (1893), ii. 28-34. The bulk of Ross's writings remain in MS.

ROSS, GEORGE WILLIAM (1841— ), Canadian politician, was born near Nairn, Middlesex county, Ontario, on the 18th of September 1841, the son of James Ross and Ellen McKinnon, natives of Ross-shire, Scotland. From 1872 to 1883 he was a Liberal member of the Federal House; from 1883-90 minister of education in the legislature of the province of Ontario; and from 1890-1905 premier and treasurer of that province. In 1905 his government was defeated, and in 1907 he retired to the Canadian Senate. He was for many years an advocate of total abstinence, and a well-known speaker on imperial questions.

ROSS, SIR NEW DALRMYLE (1770-1868), British soldier, entered the Royal Military Academy, Woolwich, in 1793, and passed out into the Royal Artillery two years later. With the Royal Horse Artillery he saw active service during the Irish rebellion of 1798, and after eleven years' service was promoted captain and appointed to command "A" troop R.H.A. (afterwards famous as the "Chestnut Troop"). In 1809 the troop landed at Lisbon and at once set out to join Wellington's army, reaching the front two days after Talavera. Ross's guns were attached to the Light Division, and, with Craufurd, part in the actions on the Coa and the battle of Busaco. When Masséna began his famous retreat from the lines of Torres Vedras, Ross's troop was amongst the foremost in the pursuit; at Redinha and Pombal, at Sabugal and Fuentes d'Onor, the "Chestnuts" earned great distinction, and in December 1811 their commander received a brevet of pay for his services. He was present at Ciudad Rodrigo and Badajoz, at the Salamanca fortress and the battle of Salamanca, still attached to the Light Division. In the campaign of Vittoria, Ross's guns were continually with the most advanced troops, and after Vittoria he was appointed to command "A" troop R.H.A., remaining with the defeated French. A further brevet-promotion and a good service reward came to Ross for his part in the campaign. At Vera in the Pyrenees Ross's troop was one of the three which played a decisive part in the action, and Vera remains a classical example of the action of horse artillery. A "A" troop was engaged at St Pierre and Orthez, and at the conclusion of peace returned to England. It was engaged at Waterloo, and though half its guns were disabled the remainder
ROSS, SIR J. C.—ROSS, R.

took part in the pursuit of the French. Ross received, besides the Peninsular and Waterloo medals, the K.C.B., the Portuguese order of the Tower and Sword and the Russian St Anne. He had commanded the troop for nineteen years when he at last received a regimental lieutenant-colonelcy. As officer commanding Royal Artillery in the Northern District, with delegated command over all the forces of the four northern counties, Sir Hew Ross had for nearly sixteen years to deal with continually threatened civil disorder, and bore himself as well as on the field of battle. From 1840 to 1858, when he retired, he practiced in one post or another, all the artillery services of the British army, and when in 1854 the test of war came, the artillery took the field in a far better condition than the rest of Lord Raglan’s army. Much of the present efficiency of the “Royal Regiment” is directly traceable to the influence of Sir Hew Ross, to whom it owes the institution of the School of Gunnery at Shoeburyness and the establishment of the Royal Artillery Institution at Woolwich. Major-general in 1841 and lieutenant-general in 1851, he became general in 1854, and died, a field-marshal and G.C.B., in 1868.

See Memoir of the R.A. Institution, 1871; and Duncan, History of the Royal Artillery (1898).

ROSS, SIR JAMES CLARK (1800–1862), British rear-admiral and Polar explorer, was born in London on the 15th of April 1800. He entered the navy in 1812 under his uncle, Captain (afterwards Sir) John Ross, whom he accompanied on his first Arctic voyage in search of a North-West passage (1819). Between 1829 and 1827 he returned four times to the same seas in the Arctic expeditions under Parry, and in 1829–33 again served on the same mission under his uncle, and while thus employed determined (1831) the position of the North Magnetic Pole. In 1834 he was promoted captain, and from 1835–38 was employed on the magnetic survey of Great Britain. In 1839–43 he commanded the Antarctic expedition of the “Erebus” and “Terror” (see Polar Regions), and got for this service he received a knighthood (1844) and was nominated to the French order of the Legion of Honour. He published a narrative of this expedition under the title of A Voyage of Discovery and Research to Southern and Antarctic Regions (1847), and was the author also of various reports on zoological and other matters relating to his earlier expeditions. He was elected a Fellow of the Royal Society in 1851, and retired in that year as captain of the Enterprise, in the first Franklin search expedition. He died at Aylesbury on the 3rd of April 1862.

ROSS, JOHN, or KOOKSKEOKE (1790–1866), chief of the Cherokee Indian Nation, was of Scotch-Indian descent, and was born among the Cherokees in Georgia in 1790. In 1819–1827 he was president of the Cherokee national committee, and in July 1827 he presided over the Cherokee constituent assembly, and under the constitution which it drafted he was principal chief from 1828 until his death. In 1830–31 he applied to the Supreme Court of the United States for an injunction restraining the state of Georgia from executing its laws within the Cherokee territory, but the court dismissed his suit on the ground that it had no jurisdiction. There was a small party among the Cherokees under the leadership of John Ridge, a subchief, who were early disposed to treat with the United States for the removal of their nation west of the Mississippi, and in February 1835, while negotiations with Ridge were progressing at Washington, Ross proposed to lead the Cherokees into the United States for $20,000,000. The United States Senate resolved that $5,000,000 was sufficient. The treaty negotiated by the Ridge party and the proposal to treat on the basis of a $5,000,000 payment were both rejected in a full council of the Cherokees held in October 1835. The council authorized Ross to renew negotiations, but before leaving for Washington he was arrested by the Georgia authorities on the ground that he was a white man residing in the Indian country contrary to law. Ross was soon released, but in December of this year a few hundred Cherokees met the United States Indian commissioner at New Echota and concluded with him a treaty of removal. When Ross learned this he called a council to meet in February 1836, and at this meeting the treaty was declared null and void and a protest against the proceedings at New Echota was signed by more than 12,000 Cherokees. Notwithstanding Ross’s opposition, the Senate in the following May ratified the treaty by a vote exceeding by one the necessary two-thirds majority, and in December 1838, Ross, with the last party of Cherokees, left for the West (see Georgia). During the Civil War, Ross first urged upon the Cherokee Nation a policy of friendly inactivity; in May 1861, proclaimed a strict neutrality; in October 1861, signed a treaty with the Confederate States; in the summer of 1862 was forced (by Union sympathizers in the Nation) to proclaim neutrality again; soon afterwards went over to the Union lines; and was in Washington treating with the Federal government in February 1863 when the treaty with the Confederate States was abrogated by the Cherokees. He died at Washington on the 1st of August 1866.

ROSS, SIR JOHN (1777–1850), British rear-admiral and Arctic explorer, son of the Rev. Andrew Ross, minister of Inch, Wigtownshire, entered the Navy as a midshipman in the Prince Frederick, and in 1789 commanded a 32-gun frigate. He was captain of the Swedish Fleet, and in 1812 was promoted commodore. Six years later he was given the command of an Arctic expedition fitted out by the Admiralty, the first of a new series of attempts to solve the question of a North-West passage. This expedition failed to discover much that was new, and somewhat prejudiced the Arctic reputation of its leader, who attained the rank of captain on his return. But in 1820, through the munificence of Mr (afterwards Sir) Felix Booth, he was able to undertake a second Arctic expedition, which, during an absence of four years, achieved important geographical and scientific results. On his return Captain Ross was the recipient of gold medals from the English and French geographical societies, and of various foreign orders, including a knighthood of the Pole Star of Sweden, and in the following year (1834) received a knighthood and a C.B. at home. In 1850 he undertook a third voyage to the Arctic regions, this time in search of Sir John Franklin, and in the following year attained the rank of rear-admiral. The United States Senate, in 1859, presented Ross with a gold medal and a silver sword, which were accepted by his widow.

ROSS, ROBERT (1766–1814), British major-general, entered the 25th Foot at the age of nineteen, and in 1795 became captain in the 7th Regiment, obtaining a half-pay majority a few months later. As a major of the 20th he served in Holland under the duke of York in 1796. At the action of Krabbendam the regiment greatly distinguished itself, though largely composed of raw militia recruits. Ross was here severely wounded. In 1801 the 20th went to Egypt and took part in the final operations which led to Menou’s surrender. In 1803, though lieutenant-colonel only by brevet, Ross succeeded to the command, and at once initiated a severe system of training, in barracks and in the field, in his regiment. The result of this was apparent when under Sir John Stuart’s command the regiment proceeded to Naples. The 20th played a decisive part in the brilliant actions of Maida, and distinguished itself not less in the subsequent storm of the castle of Scylla. In 1808–9 Ross and the 20th formed part of Anstruther’s brigade of Sir John Moore’s army in Spain, and though the statement that the 20th, owing to its good discipline, suffered less loss than any other regiment in the retreat on Corunna is incorrect, the regiment was among the best disciplined in the army. Later in 1809 it was sent to Walcheren, where fever soon laid low two-thirds of the men. Ross and his regiment were then sent to Ireland to recover, and here the colonel repeated the course of drill and manoeuvre which had so markedly improved the 20th in Malta. He received a gold medal for Corunna and a sword of honour for Maida (which action had already won him a
gold medal. At the end of 1812 the 20th was again engaged in the Peninsula, and Major-General Ross early in the following year received a brigade command in Cole’s division. Scarcely engaged at Vittoria, Ross’s brigade played a distinguished part in the operations around Pamplona, and the 20th covered itself with glory at Roncesvalles and Sarrauren. At Orthez Ross was severely wounded at the head of the brigade, which was assaulting the village of St Bôs. He was among those who received the thanks of parliament for this battle, and he received the gold medal for Vittoria and the Peninsula gold medal. At the end of the war Ross was sent in command of a brigade to harry the coast of North America, and with 4,500 men and three light guns landed in Maryland. At Bladensburg the Americans stood to fight in a strong position, but Ross’s men routed them (Aug. 24, 1814). The same evening Washington was entered, and, the public buildings having been destroyed, the expedition re-embarked. This short and brilliant campaign excited the admiration of soldiers, critics and public alike, but the commander did not live to receive his reward. A few days later an expedition against Baltimore was undertaken; skirmishing soon began, and one of the first to fall was Ross. A public monument was erected to his memory in St Paul’s Cathedral, and others at his residence at Rosstrevor and at Halifax, N.S. His family was granted the name Ross of Bladensburg by royal letters-patent.

See Gentleman’s Magazine, 1814, ii. 483; Cole, Peninsular Generals; Smythe, History of the 20th Regiment.

ROSS, a market town in the Ross parliamentary division of Herefordshire, England; 133 m. W. by N. from London and 12 S.E. from Hereford by the Great Western railway. Pop. of urban district (1901) 3305. It occupies a fine position on and about a rocky eminence on the left bank of the river Wye. There are manufactures of machinery and agricultural implements, and trade in the products of the district, such as cider and cattle. The custom fair and annual horse fairs are held annually. The church of St Mary the Virgin stands high, and is surmounted by a lofty spire; it shows good Decorated and Perpendicular work. A beautiful terrace called the Prospect adjoins the churchyard and overlooks the river. The market house, dated 1670, is a picturesque building supported on columns, the upper portion serving as a town hall. There are in the town many memorials of John Kyre, the Man of Ross, who died here in 1724, and is eulogized by Pope in his third Moral Epistle (1732). The Prospect was acquired and laid out by Kyre, who also planted the fine elm avenues near the church; his house stands opposite the market house, where he disbursed his charities; he erected the church spire, and is buried in the chancel, where his grave remained without a monument until Pope called attention to the omission. Nearly opposite the town is Wilton Castle, which defended the ford in the disturbed reign of Stephen, and suffered in the Civil Wars, being held for the Parliament and burned by the Royalists. The present building dates from the 16th century. Four miles below Ross the important ford of Goodrich probably carried traffic in British and Roman times, and a magnificent castle, on a precipice rising sheer above the right bank of the river, commands it. The keep is doubtfully assigned to a date previous to the Conquest; the important position on the Welsh March led to several subsequent additions, especially in the 14th century, and the castle was only dismantled by order of the Parliamentarians after it had strongly resisted their arms on behalf of Charles I. in 1646, being the last to fall of the royal strongholds in this county.

Ross (Ros, Rossie) was granted to the see of Hereford by Edmund Ironside, but became crown property by an exchange effected in 1359. It derived importance from its situation on the road to South Wales. In 1395, only, it was represented in parliament by two members; but it was never incorporated, and was governed by appointees of the manor court, until the Ross Improvement Act of 1865 established elected commissioners of the borough. Fairs on the days of the Ascension, Corpus Christi, St Margaret and St Andrew were conferred by Henry III., and were in existence in 1888. A market every Thursday was granted by Stephen and confirmed by Henry III.; Friday is now market day.

ROSS AND CROMARTY, a northern county of Scotland. The mainland portion is bounded N. by Sutherland and Dornoch Firth, E. by the North Sea and Moray Firth, S. by Beauly Firth and Inverness-shire, and W. by the strait of the Minch. The island portion, consisting of as much of the island of Lewis as lies north of a line drawn from Loch Resort to Loch Scarfirth, is bounded on the W., N. and E. by the Atlantic, and S. by Harris, the southern part of Lewis. Many islands, all but eleven uninhabited, are scattered principally off the west coast of Lewis and the mainland. The area of the mainland is 1,572,294 acres and of the islands 404,413 acres, giving a total for the county of 1,976,707 acres or 308860 sq. m. The inhabited islands belonging to the mainland are all situated off the west coast. They are Gillean (lighthouse) in the parish of Lochalsh, Croulin in Applecross, Horisdale, Dry and Ewe in Gairloch parish, and Martin and Tanera More, of the group of the Summer Isles in the parish of Lochbroom. On the North Sea front the chief indentations are Beauly Firth and Inner Moray Firth, marking off the Black Isle from Inverness-shire; Cromarty Firth, bounding the districts of Easter Ross and the Black Isle; Moray Firth, separating Easter Ross from Nairnshire; and Dornoch Firth, dividing north-east Ross from Sutherlandshire. On the Atlantic face—which is a coastline of more than 300 m.—the principal sea lochs and bays, from S. to N., are Loch Duich, Loch Alsh, Loch Carron, Loch Kishorn, Loch Torridon, Loch Shieldaig, Upper Loch Torridon, Gairloch, Loch Ewe, Gruinard Bay, Little Loch Broom and Enard Bay. The chief capes are Tarbat Ness on the east coast, and Cogaych, Greenstone, Reidh, Red and Hamha Points on the west. Almost all the southern boundary with Inverness-shire is guarded by a rampart of peaks, among them being An Ria-bhachan (3600), Sgurr na Lapaich (3577), Carn Eige (3877), Mam Soul (3862), Ben Attow (3353), Scour Ouran (3563), and a chain of ridges from the Saddle (3171). To the north of Glen Torridon near the masses of the Liathach, with peaks of 3456 and 3358 ft., and Ben Eay with four peaks above 3000 ft. Each on the north-eastern shore of Loch Maree rises Ben Slioch (3217), while the Fannich group contains at least six peaks of more than 3000 ft. The immense isolated bulk of Ben Wyvis (4249), and its subordinate peaks An Socach (3293) and An Carbhr (3106), is the most noteworthy feature in the north-east, and the Challic Hills in the north-west with peaks of 3483 and 3474 ft. are equally conspicuous, though less solitary. Only a small fraction of western and southern Ross is under 1000 ft. in height. Easter Ross and the peninsula of the Black Isle are comparatively level. The longest stream is the Orrin, which rises in An Sithean and pursues a course mainly E. by N. to its confluence with the Conon after a run of about 26 m., during a small part of which it forms the boundary with Inverness-shire. At Ullapool the stream runs through a narrow gorge where the drop is considerable enough to make the falls of Orrin. From its source in the mountains in Strathvaich the Blackwater flows S.E. for 19 m. till it joins the Conon, forming soon after it leaves Loch Garve the small but picturesque falls of Rogie. Within a short distance of its exit from Loch Luichart the Conon pours over a series of graceful cascades and rapids and then pursues a winding course of 12 m., mainly E. to the head of Cromarty Firth. The falls of Glomach, in the south-west, are the deepest in the United Kingdom. The stream giving rise to them drains a series of small lochs on the northern flanks of Ben Attow and, in an almost unbroken sheet about 40 ft. broad, effects a sheer leap of 370 ft., and soon afterwards ends its course in the Echag. The falls are usually visited from Invershiel, 7 m. to the south-west. Twelve miles south by east of Ullapool, on the estate of Braemar, are the falls of Measach, formed by the Drorra, a head-stream of the Broom. The cascades, three in number, are close to the gorge of Corriehalloch. The Oykell, throughout its course, forms the boundary with Sutherlandshire, to which
it properly belongs. The largest and most beautiful of the many freshwater lakes is Loch Maree (q.v.), but a few of the others are interesting. In the far north-west, 243 ft. above the sea, lies Loch Skinnskink, a lake of such irregularity of outline that it has a shore-line of 17 m. It contains several islands covered with rich woods affording a shelter to deer, and drains into Enard Bay by the Polly. Lochan Fada (the "long loch"), 1605 ft. above the sea, is 32 m. in length, has a greatest breadth of 13, covers an area of 13 sq. m. and is 248 ft. deep, with a mean depth of 102 ft. Once drained by the Muic, it has been tapped a little farther west by the Fhasaigh, which has lowered the level of the lake sufficiently to beahed the Muic. Other lakes are, north of Loch Maree, Loch Fionn (for the "white" or "clear" lake), 8 m. long by 1 m. wide, famous for its heronries; towards the centre of the loch, Loch Luichart (5 m. long by from ¾ m. to nearly 1 m. wide), fringed with birches and having the shape of a crescent; the mountain-girt Loch Fannich (7 m. long by 1 m. wide); and the wild marshy patches near (¾ m. and the Loardoch (5 m. long), on the Inverness-shire boundary. Of the straths or valleys the more important run from the centre eastwards, such as Strathconon (12 m.), Strathbran (10 m.), Strathgarve (8 m.), Strathpeffer (6 m.) and Strathcarron (14 m.). Excepting Glen Orrin (13 m.), in the east central district, the longer glens lie in the south and towards the west. In the extreme south Glen Shiil (9 m.) runs between fine mountains to its mouth on Loch Duich. General Wade's road passes down the glen. Farther north are Glen Elchaig (9 m.), Glen Carron (12 m.), in the latter of which the track of the Dingwall & Skye railway is laid, and Glen Torridor (6 m.).

Geology.—The central portion of this county is occupied by the younger highland schists or Dalradian series. These consist of quartzites, mica-schists and amphibolites in which the schistosity is with a gentle inclination towards the S.E. On the eastern side of the county the Dalradian schists are unconformably covered by the Old Red Sandstone; the boundary runs southward from Edderton on the northern boundary of Torridon to Kinlochleven on the western boundary of Arisaig. These rocks comprise red flags and sandstones, grey bituminous flags and shales. An anticline fold with a S.W.-N.E. axis brings up the basal beds of the series about the mouth of Cromarty Firth and exposes the old gneisses of the mountains at the head of Loch Torridon. These rocks, which attain a considerable thickness and are divisible into three sub-groups, build up the mountain districts about Applecross, Coigach and Sutherland. Within the Torridon zone, S.W., there are the northern parts of the old gneisses in various places penetrated by basic dikes, generally with a N.W.-S.E. direction; some of these are of great breadth. The Torridonian rocks are unconformably succeeded by a series of Cambrian strata which are of considerable thickness in this county, and fill the whole of the great Strome Basin lying west of the line of main thrusting. This belt of Cambrian rocks itself suffered an enormous amount of subordinate thrusting. It is composed of the following subdivisions in ascending order: false-bedded limestone, "black" slate, quartzite, fucoidal beds and olivellia band, serpentile greite, Durness dolomite. Overlying these are the White and Limestone: but these are not always visible at any one spot. So great has been the disturbance in the region of thrusting that in some parts of the parish of Strathpeffer, the neighbourhood of Loch Kishorn and elsewhere, the rocks have become so warped and contorted that the ancient gneiss has been piled upon the Torridonian. On the shore of Moray Firth at Rathie a small patch of Kimeridge shale occurs; and beneath the cliffs of Sandwick there is a little Lower Oolite with a thin cover of Sea-Cliff flagstone. At Inverness, at a height of 3000 ft., and such boulders of clay is found in the valleys and spread over large areas in the eastern districts. Raised beaches occur at 100, 50 and 25 ft. above the present sea-level; they are well seen at Torridon and at Gairloch. Lewis, on Long Island, is made almost entirely of ancient "Lewisian gneiss," but a little Torridonian occurs about Stornoway.

Climate and Agriculture.—On the west coast the rainfall is excessive, averaging for the year 50-42 in. at Loch Broom and 62 in. at Strome Ferry (autumn and winter being the wettest seasons), but on the east coast the annual is only mean 47. In the temperature for the year is 45-6°F., for January 38°F. and for July 57°F. The most fertile tracts lie on the eastern coast, especially in the Inverness-shire, Edderton and Kinlochleven districts. The land here is almost a strip of land 50 or 60 ft. broad, covered from a light sandy gravel to a rich deep loam. Among grain crops oats is that most generally cultivated, but barley and wheat are also raised. Turnips and potatoes are the chief green crops. On the higher ground the cultivation is a little more varied, for there are heavy flocks of sheep, blackfaced being the principal breed. Most of the horses, principally half-breds between the old garrons (hardy, serviceable, small animals) and Clydesdales, are maintained for the purposes of Agriculture. Among these the chief agricultural crop is oats, on which the natives of Highland or crosses, are large, many of them supplying the London market. Pigs are reared, though in smaller numbers than formerly, mostly by the crofters. Owing partly to the overcrowding of the island of Lewis and partly to the unfixed nature of the bulk of the population, the sheep are very small, and their wool offers little advantage; while the number of sheep in the highland districts is enormous, Sutherlandshire alone amongst Scottish counties showing an even larger proportion of holdings under 5 acres; while the average size of all the holdings throughout the shire does not exceed 20 acres. About 800 acres are devoted to deer forests, a greater area than in any other county in Scotland, among the largest being Achnasheen (50,000 acres), Fannich (20,000), Kinlochleuchart (20,600), Braemore (40,000), Inchailloch (20,000), and East Sutherland (10,000). It is a fact that the area under wood must have been remarkable, if we accept the common derivation of the word "Ross" from the Irish ros, "a wood," and there is still a considerable extent of native woodland, principally of oak and ash and also elm and oak. Roe deer abound, and foxes and alpine hares are common, while badgers and wildcats are occasionally trapped. Winged game is plentiful, and amongst birds of prey the golden eagle and osprey are frequent. The river Shiel is well frequented by sea-lochs; many rivers and lakes are rich in salmon and trout, and the pearl mussel is found in the bed of the Conan.

Other Industries.—Apart from agriculture, the fisheries are of considerable importance. The lochs, particularly those in Inverness-shire and Stornoway, and parts of other districts—Stornoway and Cromarty—and portions of two others—Loch Broom (the remainder belonging to Sutherlandshire) and Loch Carron (which includes part of Invernessshire)—herring, cod and mackerel are caught. There are a number of large whaling stations and gutters in the lochs and at the mouth of rivers. The fish is mostly exported. At Muir of Ord, in the parish of Urray, are kept abreast, cattle and sheep markets.

The Highland railway entering the county to the north of Beuly runs northwards to Dingwall, and then strikes off to the north-east by Invergordon and Tain, where it bends to the west by north, leaving the shire at Culrain, having largely followed the coast throughout. At Muir of Ord it sends off the Black Isle branch and continues along the shore of the Strome Firth. Strome Ferry and Kyle of Lochalsh on the south-western shore. Coaches connect various districts with stations on the Dingwall & Skye railway.

Population and Administration.—The population of the county in 1891 was 78,727, and in 1901 that of the mainland was 47,501, and of the islands 28,940, an aggregate of 76,450 or 25 to the sq. m. Thus Ross and Cromarty, though the third largest in size, is the least populated county in Scotland, making the smallest proportional area, the counties of Sutherland and Inverness, have the highest number of persons to the square mile. Ross and Cromarty is bordered by the whole of the county of Sutherland, and by the southern counties of Inverness and Argyll, and also by the county of Nairn. In 1901 there were 12,171 persons who spoke Gaelic, to whom 9092 belonged to the island of Lewis, of whom 3923, being blackfaced Gaelic and English (of whom 15,000 were insular). The chief towns and villages are Stornoway (pop. 2854), Dingwall (2485), Fortrose (1322), Tain (2607), Cromarty (1424), Invergordon (1085). Ullapool is a small fishing port near the mouth of Loch Broom. For administrative purposes the county is divided into six districts, namely, Black Isle (pop. 6271), Easter Ross (12,192), Lewis (28,760), Mid Ross (13,053), South-Western Ross (4103) and Western Ross (3594). The county returns one member to parliament, and Cromarty, Dingwall and Tain belong to the Wick group of parliamentary burghs, and Fortrose to the Inverness group. Excepting Cromarty, these are royal burghs, and Dingwall is the county town. Ross and Cromarty forms a sheriffdom with Sutherlandshire, and there are resident sheriffs-substitute at Dingwall and Stornoway, the former also sitting at Tain and Cromarty. The shire is under school board control, and there are academies at Tain, Dingwall and Fortrose, while several schools earn grants for higher education. The county council gives the "residue" grant
ROSSANO—ROSBACH

743

ROSSANO, a city of Calabria, Italy, in the province of Cosenza, 24 m. N.E. from that town direct, with a station 4 m. distant on the line from Metaponto to Reggio. Pop. (1901) 13,354. It is picturesquely situated on a precipitous spur of the mountain mass of Sila overlooking the Gulf of Taranto, the highest part of the town being 975 ft. above sea-level. Rossano is the seat of an archbishop, and in the cathedral is preserved the Codex Rossanensis, an uncial MS. of the Gospels of Matthew and Mark in silver characters on purple vellum, with twelve miniatures, of great interest in the history of Byzantine art, belonging to the 6th century A.D. It was bought by Grottrzymarz (q.v.) for the exhibition of Byzantine art held there in 1905. Marble and alabaster quarries are worked in the neighbourhood.

Mentioned in the Itineraries, Rossano (Rossium) appears under the Latin empire as one of the important fortresses of Calabria. Totila took it in 548. The people showed great attachment to the Byzantine empire. In the 14th century Rossano was made a principality for the great family of De Baux. Passing to the Sforza, and then to Sigismund of Poland, it was united in 1558 to the crown of Naples by Philip II of Spain in virtue of a doubtful will by Bona of Poland in favour of Giovanni Lorenzo Pappacoda. Under Isabella of Aragon and Bona of Poland the town had been a centre of literary culture; but under the Spaniards it declined. The crown sold the lordship in 1612 to the Aldobrandini, and from them it passed to the Borghesi and the Caraffa. Rossano is best known as the birthplace of St Nils the younger, whose life is the most valuable source of information extant in regard to the state of matters in southern Italy in the 10th century. Pope John VII. (795-7) was also a native of the town.

ROSSBACH, a village of Prussian Saxony in the district of Merseburg; 8 m. S.W. of that place and N.W. of Weissenfels, forming the corner of the district. Frederick the Great crossed the allied French and the army of the Empire on the 4th of November 1757. For the events preceding the battle see Seven Years' War. The Prussian camp on the morning of the 5th lay between Rosbach (left) and Bedra (right), facing the Allies, who, commanded by the French general, Charles de Rohan, prince de Soubise (1711-1787), and Joseph Frederick William, duke of Saxo-Hildburghausen (1702-1787), General Fieldzeugmeister of the Empire, had manoeuvred in the preceding days without giving Frederick an opportunity to bring them to action, and now lay to the westward, with their right near Brandeoda and their left at Mücken (see sketch). The advanced posts of the Prussians were in the villages immediately west of their camp, those of the Allies on the Schortau hill and the Galgenberg. The Allies possessed a numerical superiority of two to one in the battle itself, irrespective of detachments, and their advanced post overwatched all parts of Frederick's camp. They had lost the best of it in the maneuver of the previous day, and the duke of Hildburghausen determined to take the offensive. He had some difficulty, however, in inducing Soubise to risk a battle, and the Allies did not begin to move off their camping-ground until after eleven on the 5th, Soubise's intention being probably to engage as late in the day as possible, with the

V. der Goltz (Rossbach bis Jena, 1906 edition) gives 41,000 Allies and 21,600 Prussians as the combatant strengths. Berndt's statistical work, Zahl im Kriege, gives the respective forces engaged as Allies 43,000, Prussians 21,000. Other accounts give the Allies' total strength as 64,000 and the Prussians' as 24,000.
idea of gaining what advantages he could in partial action. The plan was to march the Allied army by Zeuchfeld, round Frederick's left (which was now occupied), to leave it in battle array, facing north, between Reichartshusen (right) and Pettstadt (left). The duke's proposed battle and the more limited aim of Soubise were equally likely to be attained by taking this position, which threatened to cut off Frederick from the towns on the Saale. This position, equally, could only be gained by marching round the Prussian flank, i.e. by a flank march before the enemy. The obvious risk of interference on the exposed flank was provided against by a considerable flank guard, and in fact it was not in the execution of their original design but in hastily modifying it to suit unfounded assumptions that the Allies met with disaster.

Frederick spent the morning watching them from a house-top in Rosbach. The initial stages of their movement convinced him that the Allies were retreating southwards towards their magazines, and about noon he went to dinner, leaving Captain von Gaudi on the watch. This officer, on a 24-hour alert, was supposed to be with Frederick at this time. Soubise's report first served only to confirm Frederick in his error. But when the duke saw with horror that the hostile cavalry and infantry were already near Pettstadt, he realized the enemy's intentions. The battle for which he had maneuvered in vain was offered to him, and he took it without hesitation. Leaving a handful of light troops to oppose the French advanced post, he hastened to the Schellenberg camp and moved—half an hour after the king gave the order—to attack the enemy. The latter were marching in the normal order in two main columns, the first line on the left, the second line on the right. The right was a column of infantry, consisting of the two right-wing foot, and between the first and second lines was the reserve artillery on the road. The right-wing cavalry was of course at the head, the left-wing cavalry at the tail of the two main columns. At first, the column distances were preserved, but when they were eastward at Zeuchfeld there was much confusion, part of the reserve infantry getting in between the two main columns and hampering the movements of the reserve artillery, and the rest, on the outer flank of the wheel, being unable to keep up with the over-rapid movement of the wheeling pivot. A weak flank guard was thrown out towards Rosbach. When it was seen that the Prussians were moving, as far as could be judged, eastward, it was presumed that they were about to re-form on a left flank and rear. All the Allied generals thereupon hurried the march, sending on the leading (right-wing) cavalry towards Reichartshusen, and calling up part of the left-wing cavalry from the tail of the column, and even the flank-guard cavalry, to the passing right. That reserved infantry was to cover them before they could form up, Soubise and the duke failed to realize. They had taken more than three hours to break camp, and it took a long time to suppose that Frederick's army could move off in one-sixth that time. It was, moreover, that the Prussians were not deploying for battle on the plain in front of Rosbach and Nahlendorf.

Frederick had no intention either of forming up parallel to the enemy or of retreating. As his army could move as a unit twice as fast as the Allies, he determined to take advantage of the situation. He took advantage of the situation. He took care to avoid being taken in by Frederick and his right. As the attack was made by the infantry, the Jänsch Hügel and the Pölen Hügel, and to fall upon them suddenly from the east. If at the moment of contact the Allies had already formed their line of battle facing north, the attack would strike their right flank. If, however, the Allied line was still on the march in column or north-eastwards, the heads of their columns would be crushed before the rest could deploy in the new direction—deployment in those days being a lengthy affair. To this end General von Seydlitz, with three squadrons of heavy cavalry, was sent to cover the Jänsch Hügel, to the Pölen Hügel; Colonel von Moller, with eighteen heavy guns, came into action in the Jänsch Hügel at 3:15 against the advancing columns of the Allied cavalry; and the infantry followed. To meet the Prussian cavalry, the enemy hurriedly galloped to and fro, bringing up their guns, the Allied squadrons, which were now north of the Reichartshusen and well ahead of their own infantry, suffered somewhat heavily; but it was usual to employ heavy guns to protect a retreat, and they continued themselves with bringing up guns. A horseman who was at the Seydlitz's thirty-eight squadrons suddenly rode down upon the head and right flank of their columns from the Pölen Hügel avec une incroyable vitesse. Gallantly the leading German regiments deployed to meet the shock, the rest was scarcely in doubt for a moment. Seydlitz threw in his last squadron, and then himself fought like a trooper, receiving a severe wound. The mêlée drifted swiftly southwards, past the Allied infantry, and Seydlitz finally rallied his horsemen in a long, straight column, which was more than two miles long. This first episode was over in half an hour, and by that time the Prussian infantry was in échelon from the left, was descending the Jänsch Hügel to meet the already confused and disheartened infantry of the Allies. The latter, as their cavalry had done, managed to deploy some regiments on the head of the column, and the French in particular formed one or two columns of attack—then peculiar to the French army—and rushed forward with the bayonet. But Moller's guns, which had advanced with the infantry, tore gaps in the composed mass, and, when it arrived within effective musket range, the attack died out before the rapid and methodical volleys of the Prussian line. Meanwhile the Allies were trying in vain to form a line of battle. The two main columns had got too close together in the advance from Pettstadt, part of the reserve which had become entangled between the main columns was extricating itself by degrees and endeavouring to catch up with the rest of the reserve column away to the right, and the reserve artillery was useless in the middle of the infantry. The Prussian infantry was still in échelon from the left, and the least-battalions that had repulsed the French columns were quickly within musket-shot of the helpless mass. A few volleys directed against the head and left flank of the column sufficed to create disorder, and then from the Tagewerben hollow Seydlitz's rallied squadrons charged, wholly unexpectedly, upon its right flank. The Allied infantry thereupon broke and fled. Soubise and the duke, who was wounded, succeeded in keeping one or two regiments together, but the rest scattered over the countryside. The battle had lasted less than an hour and a half, and the last episode of the action lasted no more than fifteen minutes. Seven Prussian battalions only were engaged, and these expended five to fifteen rounds per man. Seydlitz and Prince Henry of Prussia, the cavalry and the infantry leaders engaged, were both wounded, but the total loss of the king's army was under 500 officers and men as compared with 77001 on the part of the Allies.

ROSE, EARL OF, a title borne by the Irish family of Parsons. James Parsons, a native of Leicestershire, who flourished in the 16th century, was the father of Sir William Parsons (c. 1570–1650), one of the lords justices of Ireland. Having crossed to Ireland in early life, William Parsons became surveyor-general in 1602 and obtained land in various parts of the country. In 1620 he was made a baronet; in 1643 he was deprived of his office as lord justice, and he died early in 1650. His great-grandson, Sir Richard Parsons, bart. (c. 1657–1703), was created Baron Oxmantown and Viscount Rosse in 1668, and Richard's son and successor, Richard (d. 1741), was made earl of Rosse in 1778. The titles became extinct when Richard, the 2nd earl, died in August 1764.

Sir William Parsons had two brothers, Sir Lawrence and Sir Fenton Parsons. Sir Lawrence, second baron of the Irish exchequer, left a son, William (d. 1653), who defended Birr Castle, King's County, for over a year against the Irish during the

1 Figures again vary in different authorities. The above figure is that given by Berndt, Zadi im Kriege.
the rebellion of 1641, and whose son, Sir Lawrence Parsons (d. 1608), was made a baronet in 1677. This Sir Lawrence was a strong Protestant, and was found guilty of high treason, being attainted and sentenced to death during the brief period of James II's ascendancy in Ireland. He was not executed, however, and afterwards he took some part in the struggle against the supporters of James II. His descendant, Lawrence Harman Parsons (1740–1807), was created Baron Oxmantown in 1792, Viscount Oxmantown in 1795, and earl of Rosse in 1806. He died on the 20th of April 1827, and was succeeded by his nephew Lawrence.

Lawrence Parsons, 2nd earl of Rosse (1758–1841), the eldest son of Sir William Parsons, bart. (d. 1791), of Birr Castle, was born on the 21st of May 1758. Educated at Trinity College, Dublin, he entered the Irish parliament as member for the university in 1782, and soon came to the front in debate. A friend and follower of Henry Flood, he has been described as "one of a very, very few honest men in the Irish House of Commons." He favoured some measure of Roman Catholic and also parliamentary reform, a speech which he delivered on this question in 1793 being described by W. E. H. Lecky as "exceedingly valuable to students of Irish history," but he disliked and opposed the union of the parliaments of Great Britain and Ireland. After this event, however, he represented King's County in the united parliament until 1807, and he was a representative peer for Ireland from 1809 to 1841.

He died at Brighton on the 24th of February 1841. Rosse wrote Observations on the Bequest of Henry Flood to Trinity College, Dublin, with a Defence of the Ancient History of Ireland (Dublin, 1793). His eldest son was the astronomer William Parsons, 3rd earl of Rosse (see below).

**Rosse, William Parsons, 3rd Earl of (1800–1867).** Irish astronomer and telescope constructor, was born at York, on the 17th of June 1800, a son of the 2nd earl (above). Until his father's death, he was employed in the gas works at Trinity College, Dublin, in 1818, he proceeded to Magdalen College, Oxford, in 1821, and in the same year he was returned as M.P. for King's County, a seat which he resigned in 1834. He was Irish representative peer from 1845, president of the British Association in 1843, president of the Royal Society from 1840 to 1854, and chancellor of the university of Dublin from 1862. From 1827 he devoted himself to the improvement of reflecting telescopes; in 1839 he mounted a telescope of 3 ft. aperture at his seat, Birr Castle, Parsonstown; and in February 1845 his celebrated 6-foot reflector was finished. Owing to the fame and the disturbed state of the country, which demanded his attention as a large landowner and lieutenant of King's County (from 1831), the instrument remained unused for nearly three years, but since 1848 it has been in constant use, chiefly for observations of nebulae, for which it was particularly suited on account of its immense optical power, nominally 6000. Lord Rosse died at Monkstown in the 30th of October 1867. He had four sons. The eldest, Lawrence Parsons, 4th earl of Rosse, and Baron Oxmantown, born on the 17th of November 1840, succeeded to the title on his father's death, and made many investigations on the heavenly bodies, particularly on the radiation of the moon and related physical questions; the youngest, the Hon. Charles Algernon Parsons, born on the 13th of June 1845, is famous for his commercial development of the steam turbine.

The first constructor of reflecting telescopes on a large scale, William Herschel, never published anything about his methods of casting and polishing specula; and he does not appear to have been very successful beyond specula of 18 in. diameter, his 4-foot speculum ("the 4-foot telescope") having been little used by him (see Proc. R. Soc., 16, 30). Lord Rosse, however, published in 1831 in the Athenaeum, Nos. 831–36, 1843, Lord Rosse had therefore no help towards his brilliant results. His speculum metal is composed of four atoms of copper (126:4 parts) and one of tin (58:9 parts), a brilliant metal which resists tarnish better than any other compound tried. Chieflly owing to the brittleness of this material, Lord Rosse's first larger specula were composed of a number of thin plates of speculum metal (sixteen for a 3-foot mirror) soldered on the back of a much lighter framework made of a peculiar kind of brass (2:75 of copper to 1 of zinc), which was the same expansion as his speculum metal. In Brewster's Edinburgh Journal of Science for 1828 he described his machine for polishing the speculum, which in all essential points remained unaltered afterwards. It imitates the motions made in polishing a speculum by hand by giving both a radial and a lateral motion; the speculum revolves slowly; by shifting two eccentric pins the course of the polisher can be varied at will from a straight line to an ellipse of very small eccentricity, and a true parabolic figure can thus be obtained. The speculum and the speculum matrix, applied with water (to preserve a uniform temperature), and the polisher fits loosely in a ring, so that the rotation of the speculum makes it revolve also, but more slowly. Both the grinding and polishing tools were an invention, to fit a chain of uniform diameter in the grinding process and of the rouge employed in polishing, as also to provide for the lateral expansion of the pitch with which the polisher is coated. In September 1839 a 3-foot speculum was completed, and in 1840 another 3-foot speculum was added. Lord Rosse's large telescope had the further advantage of allowing the gas developed during the cooling to escape, thus preventing the speculum from being full of pores and cavities. This invention secured the success of the speculum; Lord Rosse was able to make a speculum of 6 ft. diameter in 1842. In the beginning of 1845 this great reflector was mounted and ready for work. The instrument has a focal length of 54 ft. and the tube is 16 ft. in diameter; owing to these large dimensions it cannot be pointed to every part of the heavens, but can only be moved a short distance from the meridian and very little to the north of the zenith; these restrictions have, however, hardly been felt, as there is always a cloud at least at any moment a sufficient number of objects within its reach.

From 1848 to 1878 it was but with few interruptions employed for observations of nebulae (see Nebulae); and many previously unsolved features in nebulae, especially the peculiarity of the similarity of "annular" and "planetary" nebulae, and the remarkable "spiral" configuration prevailing in many of the brighter nebulae. A special study was made of the nebula of Orion, and the resulting large drawing gives an extremely good representation of this complicated object. (See Telescope.)

Lord Rosse gave a detailed account of the experiments which step by step had led to the construction of the 3-foot speculum in Proc. R. Soc. (1839, 16, 36), and in subsequent publications for 1840 and 1845 he communicated short descriptions and drawings of some of the more interesting nebulae, and figures for 1861 he published a paper On the Construction of Specula of 6-ft. f. telescope, in which he described the nebulae "made with them," with numerous engravings. The accounts of the observations given in these papers, however, were fragmentary; but in 1879-80 a complete account of them was published by the Astronomer at Birr, and has been published in the Monthly Notices of the Royal Astronomical Society. Lord Rosse's work on the nebulae was not forgotten, and in 1868 the Philosophical Magazine published an article by Lord Rosse on the nebulae.

**Roselli, Cosimo (1439–1507).** Florentine painter, was born in 1439. At the age of fourteen he became a pupil of Neri di Bicci, and in 1460 he worked as assistant to his cousin Bernardo di Stefano Roselli. The first work of Cosimo mentioned by Vasari exists in S. Ambrogio, in Florence, over the third altar on the left. It is an "Assumption of the Virgin," a youthful and feeble work. In the same church, on the wall of one of the chapels, is a fresco by Cosimo which Vasari praises highly, especially for a portrait of the young scholar Pico of Miranda. The scene, a procession bearing a miracle-working chalice, is painted with much vigour and less mannerism than most of this artist's work. A picture painted by Roselli for the church of the Annunziata, with figures of SS. Barbara, Matthew, and the Baptist, is preserved in S. Maria della Pieve. Roselli also spent some time in Lucca, where he painted several altar-pieces for various churches. A picture attributed to him, taken from the church of S. Girolamo at Fiesole, is now in the National Gallery of London. It is a large retable, with, in the
centre, St Jerome in the wilderness kneeling before a crucifix, and at the sides standing figures of St Damusus and St Eusebius, St Paolino and St Eustachia; below is a predella with small subjects. Though dry and hard in treatment, the figures are designed with much dignity. The Berlin Gallery possesses three pictures by Rosselli: “The Virgin in Glory,” “The Entombment of Christ,” and “The Massacre of the Innocents.” In 1460 Rosselli, together with the chief painters of Florence, was invited by Sixtus IV. to Rome to assist in the painting of the frescoes in the Sistine Chapel. Three of these were executed by him—“The Destruction of Pharaoh’s Army in the Red Sea,” “Christ Preaching by the Lake of Tiberias,” and “The Last Supper.” The last of these is well preserved, but is a mediocre work. Vasari’s story about the pope admiring Rosselli’s paintings more than those of his able brother painters has probably little foundation. Rosselli’s Sistine frescoes were partly painted by his assistant Piero di Cosimo, who was so called after Cosimo Rosselli. His chief pupil was Fra Bartolommeo. According to Vasari, Rosselli died in 1484, but this is a mistake, as his will exists dated 25th of November 1506 (see Gaye, Car. ind. ii. 437 n.).

For an account of Rosselli’s Sistine frescoes, see Platner and Bunsen, Beschreibung der Städte Rom, i. p. i.; and Rumohr, Italien. Forschungen, ii. 265.

ROSSELLINE, ANTONIO (1427-1479), Florentine sculptor, was the brother of Matteo di Domenico Gamberelli, and had four brothers, who all practiced some branch of the fine arts. Almost nothing is known about the life of Antonio, but many of his works exist, and are full of religious sentiment, and executed with the utmost delicacy of touch and technical skill. The style of Antonio and his brother Bernardo is a development of that of Donatello and Ghiberti; it possesses all the refinement and sweetness of the earlier masters, but is not equal to them in vigour or originality. Antonio’s chief work, still in perfect preservation, is the lovely tomb of a young cardinal prince of Portugal, who died in 1459. It occupies one side of a small chapel, also built by Rossellino, on the north of the nave of San Miniato al Monte. The recumbent effigy of the cardinal rests on a handsome sarcophagus, and over it, under the arch which frames the whole, is a beautiful relief of the Madonna between two flying angels. The tomb was begun in 1461 and finished in 1466; Antonio received four hundred and twenty-five gold florins for it. A reproduction of this tomb with slight alterations, and of course a different effigy, was made by Antonio for the wife of Antonio Piccolomini, duke of Amalfi, in the church of S. Maria del Monte at Naples, where it still exists. For the same church he also executed some delicate reliefs, which perhaps err in being too pictorial in style, especially in the treatment of the backgrounds. A fine medallion relief by him in marble, originally modelled in terra-cotta, is preserved in the Bargello at Florence (see fig.).

BERNARDO ROSSELLINO (1409-1464), Florentine sculptor, was no less able than his younger brother Antonio. His finest piece of sculpture is the tomb, in the Florentine Santa Croce, of Leonardo Bruni of Arezzo, the historian of Florence, executed in 1443 some years after Bruni’s death; the recumbent effigy is of great merit. The inner cathedral pulpit at Prato, circular in form on a tall slender stem, was partly the work of Mino da Fiesole and partly by Bernardo Rossellino. The latter executed the minute reliefs of St Stephen and the Assumption of the Virgin. For his part in the work he received sixty-six gold florins. The South Kensington Museum possesses a relief by Bernardo, signed and dated (1456). It is a fine portrait of the physician Giovanni da S. Miniato. Bernardo’s works as an engineer were numerous and important, and he was also a skilful military engineer. He restored chiefs of frescoes at S. Maria della Scala and designed several fine buildings at Civita Vecchia, Orvieto and elsewhere. He also built fortresses and city walls at Spoleti, Orvieto and Civita Castellana. He was largely employed by Nicholas V. and Pius II. for restorations in nearly all the great basilicas of Rome, but little trace of his work remains, owing to the sweeping alterations made during the 17th and 18th centuries. Between the years 1461 and 1464 (when he died while engaged on the Lazzari monument at Pistoia) he occupied the important post of capo-maestro to the Florentine duomo. A number of buildings at Pienza, executed for Pius II., are attributed to him; the Vatican registers mention the architect of these as M° Bernardo di Fiorenza, but this indication is too slight to make it certain that the elder Rossellino is referred to (see Vasari, ed. Milanesi, iii. 93 seq.).

See Wilhelm Bode, Die Italiensische Plastik (Berlin, 1902).

ROSSETTI, CHRISTINA GEORGINA (1830-1894), English poet, was the youngest of the four children of Gabriele Rossetti (see the article on her brother DANTE GABRIEL ROSSETTI). She was born at 38 Charlotte Street, Portland Place, London, on the 5th of December 1830. She enjoyed the advantages and disadvantages of the strange society of Italian exiles and English eccentrics which her father gathered about him, and she shared the studies of her gifted elder brother and sister. As early as 1847 her grandfather, Gaetano Polidori, printed privately a volume of her Verses, in which the richness of her vision was already faintly prefigured. In 1859 she contributed to The Germ seven pieces, including some of the finest of her lyrics. In her girlhood she had a grave, religious beauty of feature, and sat as a model not only to her brother Gabriel, but to Holman Hunt, to Madox Brown and to Millais. In 1853-54 Christina Rossetti for nearly a year helped her mother to keep a day-school at Frome-Selwood, in Somerset. Early in 1854 the Rossettis returned to London, and the father died. In poverty, in ill-health, in extreme quietness, she was now performing her life-work. She was twice sought in marriage, but each time, from religious scruples (she was a strong high-churchman), she refused her suitor; on the former of these occasions she sorrowed greatly, and her suffering is reflected in much of her early song. In 1861 she saw foreign countries for the first time, paying a six weeks’ visit to Normandy and Paris. In 1863 she published what was practically her earliest book, Goblin Market, and took her place at once among the poets of her age. In this volume, indeed, is still to be found a majority of her finest writings. The Prince’s Progress followed in 1866. In 1867 she, with her family, moved to 56 Euston Square, which became their home for many years. Christina’s prose work Commonplace appeared in 1870. In April 1871 her whole life was changed by a terrible affliction, known as “Graves’s disease”; for two years her life was in constant danger. She had already composed her book of children’s poems, entitled Sing-Song, which appeared

Marble Relief by Antonio Rossellino.
in 1872. After a long convalescence, she published in 1874 two works of minor importance, Annus Domini and Speaking Likenesses. The former is the earliest of a series of theological works in prose, of which the second was Seek and Find in 1879. In 1881 she published a third collection of poems, A Pageant, in which there was evidence of slackening lyrical power. She now gave herself almost entirely to religious disquisition. The most interesting and personal of her prose publications (but it contained verse also) was Time Flies (1885)—a sort of symbolic diary or collection of brief homilies. In 1890 the S.P.C.K. published a volume of her religious verse. She collected her poetical writings in 1891. In 1892 she was led to publish a very bulky commentary on the Apocalypse, entitled The Face of the Deep. After this she wrote little. Her last years were spent in retirement at 30 Torrington Square, Bloomsbury, which was her home from 1876 to her death. In 1892 her health broke down finally, and she had to endure terrible suffering. From this she was released on the 29th of December 1894. Her New Poems were published posthumously in 1896. In spite of her manifest limitations of sympathy and experience, Christina Rossetti takes rank among the foremost poets of her sex for the purity and solidity of her finest lyrics, the glow and music in the verse, the lavishness of imagery, the reverence, her extraordinary mixture of austerity with sweetness and of sanctity of tone with sensuousness of colour, Christina Rossetti, in her best pieces, may challenge comparison with the most admirable of our poets. The union of fixed religious faith with a hold upon useful physical beauty and the rich parts of nature has been pointed to as the most original feature of her poetry. Hers was a doctored spirit, timid, nun-like, bowed down by suffering and humility; her character was so retiring as to be almost invisible. All that we really need to know about her, save that she was a great saint, was that she was a great poet.

The Family Letters of Christina Rossetti were edited by W. M. Rossetti in 1908.

ROSETTI, DANTE GABRIEL (1828-1882), English poet and painter, whose full baptismal name was Gabjel Charles Dante, was born on the 3rd of May 1828, at 38 Charlotte Street, Portland Place, London. He was the fourth son and the second of the four children of Gabriele Rossetti (1783-1854), an Italian poet and liberal, who, about 1824, after many vicissitudes connected with the part he played in the Naples reform movement against Ferdinand L., came to England, where he married in 1826 Frances Mary Polidori (d. 1886), sister of Byron's physician, Dr John Polidori, and daughter of a Tuscan, Gaetano Polidori, who had in early youth been Alferi's secretary and who had married an English lady. In 1831 he became professor of Italian in King's College, London, and afterwards achieved a recognized position as a subtle and original, if eccentric, commentator on Dante. In 1852 he published a volume of Italian religious poems. His family, besides Dante Gabriel, consisted of Maria Francesca (1827-1876), who eventually entered an Anglican sisterhood—she is known to Dante scholars by her valuable Shadow of Dante; William Michael (b. 1829), a well-known man of letters who from 1845 to 1894 was in the Inland Revenue Office—he married a daughter of Ford Madox Brown; and Christina (b. 1833), whose literary spirit was strongly entrenched in her, and the talent which was always distinguished in William Michael rose to the height of rare genius in Dante Gabriel and Christina.

Dante Rossetti's education was begun at a private school in Foley Street, Portland Place, where he remained, however, only nine months, from the autumn of 1835 to the summer of 1836. He next went (in the autumn of 1836) to King's College School, where he remained till the summer of 1843, having reached the fourth class. From early childhood he had displayed a marked propensity for drawing and painting. It had there-
jejune, its handling was timid, while its coloration and tonality were dry, not to say thin. Such was Rossetti's advent in art under the Pre-Raphaelite banner. The picture's reception was not encouraging, nor did the next work from his hands induce him to emerge from that proud exclusiveness in which all such minds as his are content to abide. The diverse modes of the other Brothers chose otherwise, but of Rossetti's immediate circle it has been truly said: "It appears that of seven young men and Brethren five have attained eminent positions, four of them being pre-eminent, although for years after the society was formed no single member, whatever his position might be, escaped insult, obloquy and wicked and malicious misrepresentation. The more conspicuous the Brother [e.g. Millais], the more outrageously was he attacked."

No estimate of Rossetti's genius, his triumph and his life as a whole can be justly based without ample allowance being made for the circumstances which attended his advent as a painter. "Ecce Ancilla Domini!" the smaller picture which is now in the National Gallery of British Art at Millbank, was the one perfect outcome of the original motive of the Pre-Raphaelite Brotherhood by its representative and typical member. It is replete with the mystical mood which then ruled the painter's mind; that mood chose what may be called virginal white and its harmonies as its aptest expression and is in its very substance Rossetti's tonality. It was exhibited at the Portland Gallery in 1850. After these pictures were finished, the outside world saw no more of Rossetti as a painter until it had prepared itself to see modern art from a higher plane than before.

In December 1850 there appeared the first number of The Germ, a magazine (which lasted for only four numbers) in which Rossetti had a leading place as the poet in verse and prose. The influence of Robert Browning upon Rossetti was more potent in The Germ than in that splendid romance in water-colours called "The Laboratory," where a court lady of the ancien régime visits an old poison-monger to obtain from him a fatal potion for her rival in love. This wonderful gem of colour, glowing in lurid and wicked passion and voluptuous suggestion, marked the opening of the artist's second period and signalized his departure from that phase of Pre-Raphaelitism of which "Ecce Ancilla Domini!" was the crowning achievement, and, so far as he was concerned, the artistic ne plus ultra. Millais and the other Brothers remained faithful during several years yet to come. Later in 1850, Rossetti produced the original, which is preserved, of the famous "Hesternia Rosata" in water-colours, and it is in water-colours, and, like "Hesternia Rosa," a sardonic tragedy. "How they met Themselves" came next, and, in illustrating a legend similar to that of the Doppelgänger, affirmed the force, the originality and the tragic passion of Rossetti's genius. Two lovers are walking in a twilight wood, where they are confronted suddenly by their apparitions, parting during the night. The year 1852 produced "Giotto painting Dante's Portrait," and saw a new development of the painter's mind and mood, drenched with a humour not often to be seen in him. In its somewhat dry coloration it differed from the ardent jewel-like glow and deeper gloom of "Borgia" and its successor and the summptuous visions of womanhood in later pictures. "Found," Rossetti's sole contribution of the sort which Mr Holman Hunt affected, was begun somewhere about this period; but this piece of pictorial moralizing (the analogue of the poet's own "Jenny"), vigorous and intensely pathetic as it is, was never received by its author, being, indeed, far removed from Rossetti's inner self, which was rather over-scrupulous of didactic art, and thoroughly indisposed towards attempts to ameliorate anybody's condition by means of pictures. Nor did the stringency of naturalistic painting suit his mood or his experience. Nevertheless, what is his in the existing picture remains a masterpiece of poetry with exquisitely finished parts.

Passing a few fine but comparatively unimportant drawings, such as "Lancelot and Guinevere at the Tomb of Arthur," "Lancelot looking at the Dead Lady of Shalott," "Marina of the South," "Sir Galahad," "The Blue Closet," and various works owing subjects to the Arthurian cycle of romances, we may note that the artist illustrated by five cuts Poems by Alfred Tennyson, on which Millais and Mr Holman Hunt were also engaged, and which was published by Moxon in 1857. As in "Ecce Ancilla Domini!" we had virginal white and morning light employed to strengthen the mystical significance of the design, so in "Borgia" Venetian voluptuousness and sensuous splendours obtained, and in "The Blue Closet" is a very potent and suggestive exercise intended to symbolize the association of colour with music. The last is one of the subllest of the artist's "inventions," and it shows how he had developed upon "Borgia" an artistic sympathy which is but too likely to be caviare to the general.""The Wedding of St George" is not so fine; nor was "Lancelot's Dream of the Sangreal," Rossetti's part in the luckless decorations of the Oxford Union 1 (1857-58); nor are "Guinevere and Sir Lancelot," "Galahad in the Chapel" and other Arthurian examples quite worthy of his art. "Boccaccia," the super-sensuous portrait of a woman, a work of wonderful fire, and the pictures on the pulpit at Llandaff Cathedral, marked the expiration of the second period in Rossetti's art and the beginning of a new, the third, last and most powerful of all the painter's works. The picture "Dr Johnson at the Mitre," when the "pretty fools" consulted the lexicographer anent Methodism, is a good example of his humour.

In 1861 Rossetti produced several fine designs for stained glass, and in the revival of stained-glass painting as an art he had a larger share than has frequently been ascribed to him. The practice of designing upon a large scale, and employment of masses of splendid though deep-toned colours, had probably something to do with the prodigious development of his powers and the enlargement of his views as regards painting which took effect at this period (1862-63). At this time a striking and highly imaginative triptych, representing three events in the careers of Paolo and Francesca, was produced; it is a great improvement upon an earlier design. There is unprecedented energy in the group of the lovers embracing in the garden-house just as they have paused in reading the fatal romance. The composition of this group, with the circular window behind their figures, is as fine as it was comparatively novel in Rossetti's practice. Its lurid coloration was so thoroughly in harmony with the picture design of the subject that in this respect the work excelled all the paintings in recent works. Rossetti's art in the same elements, energy, a sympathetic and poetic scheme of colour, and composition of a fine order, combined with far greater force and originality in "The Bride," or "The Beloved," that magnificent illustration of The Song of Solomon. The last named is a life-size group of powerfully coloured and diversely beautiful damsels accompanying their mistresses with music and with song on her way to the bridgework. This picture, as regards its brilliance, finish, the charms of four lovely faces and the splendour of its lighting, occupies a great place in the highest grade of modern art of all the world. It is likewise, so far as the qualities named are concerned, the crowning piece of Rossetti's art, and stands for him much as the "Sacred and Profane Love" of Titian represents that master. Very fine, indeed, but hardly so passionate and virile, is the "Beata Beatrix," now in the National Gallery of British Art with "Ecce Ancilla Domini!" which he produced thirteen years earlier. These works belong to a category of fine and quite original examples, all replete with...
similar technical qualities, poetry and pathos. The group comprises paintings by which Rossetti is best known, such as “Proserpina in Hades,” which is, on the whole, perhaps the most original, if not indeed the most poetical and powerful, of all his output; “Sibylla Palmifera,” “Venus Verticordia,” “Lilith” (the better of the two versions is now referred to), “Washing Hands,” “Monna Vanna,” “II Ramocello,” “Aurea Catena,” “La Pia,” “Rosa Triplex,” “Veronica Veronese,” “La Ghirlandata,” “Pandora,” “The Blessed Damozel,” and, last and largest, but not, perhaps, the greatest of his paintings (a distinction for which “The Bride” and “Proserpina” must contend), the famous “Dante’s Dream,” now in the Walker Art Gallery at Liverpool. Besides these, Rossetti produced a large number of fine things. Nearly all of these were exhibited by the Royal Academy and at the Burlington Fine Art Club in 1883, after their author’s death.

Meanwhile, the literary side of Rossetti had developed pari passu with his achievements as a painter. The goal before the young Rossetti’s eyes was to reach through art the forgotten world of old romance—that world of wonder and mystery and spiritual beauty which the old masters knew and could have painted had not lack of science, that world of combined with slavery to monkish traditions of asceticism, crippled their strength. In that great rebellion against the renascence of classicism which (after working much good and much harm) resulted in 18th-century materialism—in that great movement of man’s soul which may be appropriately named “the Renascence of the Spirit of Wonder in Poetry and Art”—he had become the acknowledged protagonist before ever the Pre-Raphaelite brotherhood was founded, and so he remained down to his last breath. It was by inevitable instinct that Rossetti turned to that mysterious side of nature and man’s life which to other painters of his time had been a mere fancy-land, to be visited, if at all, on the wings of poetry and of them any permanent vitality of the Renascence of Wonder in modern times. If it is really the inevitable expression of the soul of man in a certain stage of civilization (when the sanctions which have made and moulded society are found to be not absolute and eternal, but relative, mundane, ephemeral and subject to the higher sanctions of unseen powers that work behind “the shows of things”), then perhaps one of the first questions to ask in regard to any imaginative painter of the 19th century is, In what relation did he stand to the newly awakened spirit of romance? Had he a genuine and independent sympathy with that temper of wonder and mystery which all over Europe had preceded and now followed the temper of imitation, prosaic acceptance, pseudo-classicism and domestic materialism? or was his apparent sympathy with the temper of wonder, reverence and awe the result of artistic environment dictated to him by other and more powerful and original souls around him?

We do not say that the mere fact of a painter’s or a poet’s showing but an imperfect sympathy with the Renascence of Wonder is sufficient to place him below a poet in whom that sympathy is more nearly complete, but we do say that, other things being equal or anything like equal, a painter or poet of this time is to be judged very much by his sympathy with that great movement, which we call the Renascence of Wonder because the word “romanticism” never did express it even before it had been vulgarized by French poets, dramatists, doctrinaires and literary harlequins. To struggle against the pri: traditions of the 18th century, the unities of Aristotle, the delineation of types instead of characters, as Chateaubriand, Madame de Staël, Balzac and Hugo struggled, was well. But in studying Rossetti’s works we reach the very key of those “high palaces of romance” which the English mind had never, even in the 18th century, wholly forgotten, but whose gates no Frenchman ever yet unlocked. Not all the romantic feeling to be found in all the French romanticists (with their theory that not earnestness but the grotesque is the life-blood of romance) could equal the romantic spirit expressed in a single picture or drawing of Rossetti’s; such, for instance, as Beata Beatrix or Pandora. For, while the French romanticists—inspired by the theories (drawn from English exemplars) of Novalis, Tieck and Herder—cleverly simulated the old romantic feeling, the “beautifully devotional feeling” which Holman Hunt speaks of, Rossetti was steeped in it: he was so full of the old frank childlike wonder and awe which preceded the great renascence of materialism that he might have lived and worked amidst the old masters. Hence, in point of design, so original is he that to match such ideas as are expressed in “Lilith,” “Hesterna Rosa,” “Michael Scott’s Wooling,” the “Sea Spell,” &c., we have to turn to the sister art of poetry, where only we can find an equally powerful artistic representation of the idea at the core of the old romanticism—the idea of the evil forces of nature assailing man through his sense of beauty. We must turn, we say, not to art—not even to the old masters themselves—but to the most perfect efflorescence of the poetry of wonder and mystery—to such ballads as the “Demon Lover,” to Coleridge’s “Christabel” and “Kubla Khan,” to Keats’s “La Belle Dame sans Merci,” for parallels to Rossetti’s most characteristic designs. Now, although the idea at the heart of the highest romantic poetry (allied perhaps to that apprehension of the warring of man’s soul with the appetites of the flesh which is the basis of the Christian idea) may not belong exclusively to what we call the romantic art (the Greeks, and also most Asiatic peoples, were more or less familiar with it, as we see in the Sabaean and Absul of Jami), yet it became peculiarly a romantic note, as is seen from the fact that in the old masters it resulted in that asceticism which is its logical expression and which was once an inseparable incident of all romantic art. But in order to express this stupendous idea as fully as the poets have expressed it, how is it possible to adopt the asceticism of the old masters? This is the question that Rossetti has asked himself, and answered by his own progress in Keats, and in Sade, and in Thomas Carlyle. In all of his pictures, the poet’s own being is displayed that power which Blake calls vision—the power, as he finely says, is “surrounded by the daughters of inspiration,” the power, that is, of seeing imaginary objects and dramatic actions—physically seeing them as well as mentally—and flashing them upon the imaginations (even upon the corporeal senses) of others.

Mr. W. M. Rossetti (in the Preface to the Collected Works, 1886) has given an interesting account of his brother’s literary nurturing. Shakespeare, Walter Scott, Byron, the Bible were the earliest influences: then Shelley, Mrs Browning, the older English and Scottish ballads, and Dante. Afterwards he preferred Keats to Shelley. By 1847 he was “deep in Robert Browning.” Malory’s “Morte d’Arthur,” about 1856, engrossed him; Victor Hugo and De Musset, among French poets, were his delight. In his last years he had an enthusiasm for Charles de Coster’s ballads, and loved to compose, but “The Germ” (1850) contained Rossetti’s first published prose or verse. In it appeared “The Blessed Damozel,” the prose poem “Heart and Soul,” six sonnets and four lyrics. “The Blessed Damozel” was written so early as 1847 or 1848. “Sister Helen” was produced in its original form in 1850 or 1851. His translations from the early Italian poets also began as far back as 1845 or 1846, and may have been mainly completed by 1849. He published a volume of The Early Italian Poets (Dante and his Circle) in 1861. In 1856 he contributed to the Oxford and Cambridge Magazine, in which among other things the “Burden of Nineveh” appeared. Materials for a volume of original poetry accumulated slowly, and these having been somewhat widely read in manuscript had a very great influence upon contemporary poetic literature long before their appearance in print. He had intended to publish a volume in 1862, but the death of his wife (see below) caused its postponement till 1870. In poetry no less than in art what makes Rossetti so important a figure is the position he took up with regard to the modern revival of the “romantic” spirit. The Renascence of Wonder culminates
ROSSETTI, D. G.

in Rossetti’s poetry as it culminates in his painting. The poet who should go beyond Rossetti would pass out of the realm of poetry into pure mysticism, as certain of his sonnets show. Fine as are the sonnets (of which the sonnet sequence, the “House of Life,” in the 1881 volume, may be specially mentioned), it is in his romantic ballads that Rossetti (notwithstanding a certain ruggedness of movement) shows his greatest strength. “Sister Helen,” “The Blessed Damozel,” “Staff and Scrip,” “Eden Bower,” “Troy Town,” “Rose Mary,” as representing the modern revival of the true romantic spirit, take a place quite apart from the other poetry of the time.

Rossetti’s poetry, and his prose too, is marked by an extraordinary fastidiousness of expression and beauty of diction; the form and colour of his style are alike marvellous in clearness and loveliness of language. But the dominant characteristic, after all, is the underlying idea, the romantic motive. By the revival of the romantic spirit in English poetry we mean something much more than the revival, at the close of the 18th century, of natural language, the change discussed by Wordsworth in his famous Preface, and by Coleridge in his comments thereon—of that change of diction and of poetic methods which is commonly supposed to have arisen with Cowper, or, if not with Cowper, with Burns. The truth is that Wordsworth and Coleridge were too near the great changes in question, and they themselves took too large a part in those changes, to hold the historical view of what the change really was. Important as was the change in poetic methods which they so admirably practised and discussed, important as was the revival of natural language, which then set in, it was not nearly so important as that other revival which had begun earlier and of which it was the outcome—the revival of the romantic spirit, the Renascence of Wonder, even beneath the weight of 18th-century diction, the first movement of which is certainly English, and neither German nor French in its origin, and can be traced through Chatterton, Maclaren and the Percy Ballads.

As a mere question of methods, a reaction against the poetic diction of Pope and his followers was inevitable. But, in discussing the romantic temper in relation to the overthrow of the bastard classicism and didactic materialism of the 18th century, we must go deeper than mere artistic methods in poetry. When closely examined, it is in method only that the poetry of Cowper is different from the ratiocinative and unromantic poetry of Dryden and Pope and their followers. Pope treated prose subjects in the ratiocinative—that is to say, the prose—temper, but in a highly artificial diction which people agreed to use when treating poetry subjects. Coleridge treated them in the same prose temper, but used natural language; a noble thing to do, no doubt. But this was only a part (and by no means the chief part) of the great work achieved by English poetry at the close of last century. That period, to be sure, rendered obsolete the poetic diction of Pope; but it introduced something more precious still—entire freedom from the hard rhetorical materialism imported from France; it gave a new seeing to English eyes, which were opened once more to the mystery and the wonder of the universe and the romance of man’s destiny; it revived, in short, the romantic spirit, but the romantic spirit enriched by all the clarity and sanity that the renaissance of classicism was able to lend. Of the great movement which substituted for the didactic materialism of the 18th century the new romanticism of the 19th, the leaders were Coleridge and Scott, admirably followed by Byron, Shelley and Keats. Not that Wordsworth was a stranger to the romantic temper. The magnificent image of Time and Death under the yew tree is worthy of any romantic poet that ever lived, yet it cannot be said that he escaped save at moments from the comfortable 19th-century didactics, or that he was a spiritual writer in the sense that Coleridge, Blake and Shelley were spiritual writers.

Of the true romantic feeling, the ever-present apprehension of the spiritual world and of that struggle of the soul with earthly conditions which we have before spoken of, Rossetti’s poetry is as full as his pictures—so full, indeed, that it was misunderstood by certain critics, who found in the most spiritualistic of poets and painters the founder of a “fleshy school.” Although it cannot be said that “The Blessed Damozel” or “Sister Helen” or “Rose Mary” reaches to the height of the masterpieces of Coleridge, the purely romantic temper was with Rossetti a more permanent and even a more natural temper than with any other 19th-century poet, even including the author of “Christabel” himself. As to the other 19th-century poets, though the Ettrick Shepherd in “The Queen’s Wake” shows plenty of the true feeling, Hogg’s verbosity is too great to allow of really successful work in the field of romantic ballad, where concentrated energy is one of the first requisites. And even Dobell’s “Keith of Ravelston” has hardly been fused in the fine atmosphere of fairyland. Byron’s “footlight bogies” and Shelley’s metaphysical abstractions had of course but very little to do with the inner core of romance, and we have only to consider Keats, to whose “La Belle Dame sans Merci” and “The Eve of St Mark” Rossetti always acknowledged himself to be deeply indebted. In the famous close of the seventh stanza of the “Ode to a Nightingale”—

“Charm’d magic casements opening on the foam
Of perilous seas in faery lands forlorn”—

there is of course the true thrill of the poetry of wonder, and it is expressed with a music, a startling magic, above the highest reaches of Rossetti’s poetry. But, without the evidence of Keats’s two late poems, “La Belle Dame sans Merci” and the “Eve of St Mark,” who could have said that Keats showed more than a passing apprehension of that which is the basis of the romantic temper—the supernatural? In contrasting Keats with Rossetti, it must always be remembered that Keats’s power over the poetry of wonder came to him at one flash, and that it was not (as we have said elsewhere) “ till late in his brief life that his bark was running full sail for the enchanted isle where the old ballad-writers once sang and where now sate the wizard Coleridge alone.” Though outside Coleridge’s work there had been nothing in the poetry of wonder comparable with Keats’s “La Belle Dame sans Merci,” the latter had previously in “Lamía” entirely failed in rendering the romantic idea of beauty as a maleficient power. The reader, owing to the atmosphere surrounding the dramatic action being entirely classic, does not believe for a moment in the serpent woman. The classic accessories suggested by Burton’s brief narrative hampered Keats where to Rossetti (as we see in “Pandora,” “Cassandra” and “Troy Town”) they would simply have given birth to a fantastic idea. To Rossetti, Coleridge’s La Belle Dame sans Merci can be compared as a worker in the Renaissance of Wonder. Although his apparent lack of rhythmical spontaneity places him below the great master as a singer (for in these miracles of Coleridge’s genius poetry ceases to appear as a fine art at all—it is the inspired song of the changing child “singing, dancing to itself”), in permanence of the romantic feeling, in vitality of belief in the power of the unseen, Rossetti stands alone. Even the finest portions of his historical ballad “The King’s Tragedy” are those which deal with the supernatural.

The events of Rossetti’s life may be briefly summarized. In the spring of 1860 he married Elizabeth Eleanor Siddall, a milliner’s assistant, who, being very beautiful, was constantly painted and drawn by him. From 1856 onwards he had been very intimate with William Morris and Edward Burne-Jones, who had the greatest affection and artistic admiration for him. Mrs Rossetti, whose health was delicate, had one still-born child in 1861, and she died from an overdose of laudanum in February 1862. Rossetti then moved from Blackfriars to 16 Cheyne Walk, Chelsea, where for a short time George Meredith, A. C. Swinburne and W. M. Rossetti lived with him. Mrs Rossetti’s own water-colour designs show a most extraordinary genius for invention and a rare instinct for colour. Rossetti felt her death so acutely that in the first paroxysm of his grief he insisted upon his poems (then in manuscript) being buried in her coffin. But in 1869 the manuscripts were disinterred, and published in 1870. From this time to his death he
continued to write poems and produce pictures—in the latter relying more and more upon his manipulative skill but exercising less and less his exhaustless faculty of invention.

In 1871 an unsigned article in the *Contemporary Review* (by Robert Buchanan) on the "Fleshy School of Poetry" made a fierce attack on Rossetti's poems from what was intended to be a moral point of view, to which he answered by one on the "Stealthy School of Criticism." The attack was deeply felt by him, and increased his tendency—previously tempered by natural high spirits—towards gloomy brooding. About 1886 the curse of the artistic and poetic temperament, insomnia, attacked him. One of the most distressing effects of this malady is a nervous shrinking from personal contact with any save a few intimate and constantly seen friends. This peculiar kind of nervousness may be aggravated by the use of narcotics, and in his case was aggravated to a very painful degree; at one time he saw scarcely any one save his own family and immediate family connections and the present writer. He was frequently away with William Morris at Kelmscott in Oxfordshire. During the time that his second volume of original poetry, *Ballads and Sonnets*, was passing through the press (in 1881) his health began to give way, and he left London for Cumberland. A stay of a few weeks in the Vale of St John, however, did nothing to improve his health, and he returned much shatterd. He then went to Birchington-on-Sea, but received no benefit from the change, though affectionately tended by friends like Hall Caine and others already mentioned; and, gradually sinking from a complication of disorders, he died on Sunday the 9th of April 1882.

In all matters of taste Rossetti's influence has been immense. The purely decorative arts (see ARTS AND CRAFTS) he may be said to have rejuvenated directly or indirectly. And he left the deepest impression upon the poetic methods of his time.

One of the most wonderful of Rossetti's endowments, however, was never a literary nor an artistic kind: it was that of a true and most winning personality which attracted towards itself, as if by an unconscious magnetism, the love of all his friends, the love, indeed, of all who knew him. (T. W.-D.)

Rossetti prefixed to the Collected Works, published in 1885; [ed. by] M. Rossetti's Mother's Diaries and Education (1904) is full of interesting sidelights. See also F. G. Stephens, D. G. Rossetti; " Portfolio" monograph (1894); H. C. Marillier, D. G. Rossetti (1899 and 1901); W. Sharp, Dante Gabriel Rossetti: A Pilgrimage to the Renaissance (1900); and Recollections, by Gabriel Rossetti (1882); W. Allingham, Letters of Dante Gabriel Rossetti to William Allingham, 1854-70 (1897). An article by Vernon Lushington in the *Oxford and Cambridge Magazine* (1895) is an early contemporary view worth noting.

ROSSI, LUIGI DE', a 17th-century Italian musical composer, said to have been born at Naples towards the close of the 17th century. Of his life practically nothing is known. An opera of his, *Il Palazzo Incantato*, was given at Rome in 1642; in 1646 he was invited by Cardinal Mazarin to Paris, where he gave his opera *Le Mortage d'Orphée et d'Eurydice* (1647), the first opera given in France. M. Louis Petit (1646) described him as musician to Cardinal Antonino Berini, and G. A. Perti in 1668 speaks of him along with Carissimi and Cesti as "the three greatest lights of our profession." Rossi is noteworthy principally for his chamber-cantatas, which are among the finest that the 17th century produced. A large quantity are in MS. in the British Museum and in Christ Church library, Oxford. *La Gelosia*, printed by F. A. Gevaert in *Les Glories d'Italie*, is an admirable specimen.

ROSSI, PELLEGRINO LUIGI EDARDO, COUNT (1787—1848), Italian economist and statesman, was born at Carrara on the 13th of July 1787. He was educated at Pavia and Bologna, and in 1812 became professor of law at the latter university. In 1815 he gave his support to Joachim Murat, and after his fall escaped to France, whence he proceeded to Geneva. There he began a course of jurisprudence applied to Roman law, the success of which gained him the unusual honour of naturalization as a citizen of Geneva. In 1820 he was elected as a deputy to the cantonal council, and was a member of the extraordinary diet of 1832. He was entrusted with the task of drawing up a revised constitution, which was known as the *Pacte Rossi*. This was rejected by a majority of the diet, a result which deeply affected Rossi, and induced him to look with favour on the suggestions of Guizot and the duc de Broglie that he should settle in France. He was appointed in 1833 to the chair of political economy in the Collège de France, vacated by the death of J. B. Say. He was naturalized as a French citizen in 1834, and in the same year became professor of constitutional law in the faculty of law at Paris. In 1836 he was elected a member of the Académie des sciences politiques, was raised to the peerage in 1839 and in 1843 became dean of the faculty of law. In 1845 he was sent to Rome by Guizot to discuss the question of the Jesuits, being finally appointed ambassador of France at Rome. The revolution of 1848 severed his connexion with France, and he remained in Rome, where he was minister of the interior under Pius IX. He was unpopular, however, owing, it is said, to his conservative views, and was assassinated on the 15th of November, as he was alighting at the steps of the House of Assembly.

As a statesman, Rossi was a man of signal ability and intrepid character, but it is as an economist that his name will be best remembered. His *Cours d'économie politique* (1838-44) gave in classic form an exposition of the doctrines of Say, Malthus and Ricardo, and was translated into many other languages. *Cours de droit constitutionnel* (1836-67), and *Mélanges d'économie politique, d'histoire et de philosophie* (2 vols., 1857). His widow left a sum of 100,000 francs to the Institut de France, to found in his memory scholarships in political economy or law. Carrara erected a statue to his memory in 1876, and in 1887 the Société d'économie politique celebrated his centenary with a notice of his life and works.

See also the *Comte Fleury d'Ideville, Le Comte Pellegrino Rossi, sa vie, ses œuvres, sa mort* (1887).

ROSSINI, GIOACCHINO ANTONIO (1792—1868), Italian musical composer, was born at Pesaro on the 29th of February 1792. His father was town trumpeter and inspector of slaughter-houses, his mother a baker's daughter. The elder Rossini's sympathies for the French became a source of trouble when, after the occupation of the papal state by the French in 1796, the Austrians restored the old régime. He was sent to Rome, and his wife took Gioacchino to Bologna, earning her living as a *prima donna buffa* at various theatres of the Romagna, where she was ultimately rejoined by her husband. Gioacchino remained at Bologna in the care of a pork butcher, while his father played the horn in the bands of the theatres at which his mother sang. The boy had three years' instruction in the harpsichord from Prinetti of Novara, but Prinetti played the scale with two fingers only, combined his profession of a musician with the business of selling liquor, and fell asleep while he stood, so that he was a fit subject for ridicule with his critical pupil. Gioacchino was taken from him and apprenticed to a smith. In *Angelo Tesei he found a congenial master, and learned to read at sight, to play accompaniments on the pianoforte, and to sing well enough to take solo parts in the church when he was ten years of age. At thirteen he appeared at the theatre in *La Cambiale di Matrimonio*, where his only appearance as a public singer (1805) was as a side singular. In 1809 he was also able to play the horn. In 1807 he was admitted to the counterpoint class of Padre P. S. Mattei, and soon after to that of Cavedagni for the 'cello at the Conservatorio of Bologna. He learned to play the 'cello with ease, but the pedantic severity of Mattei's views on counterpoint only served to accentuate the tendency of his genius towards a freer school of composition, and his insight into orchestral resources is to be ascribed rather to knowledge gained by scoring the quartets and symphonies of Haydn and Mozart, than to any prescribed rules for the composition of music. At Bologna he was known as "il Tedeschino" on account of his devotion to Mozart. Through the friendly interposition of the Marquis Cavalli, his first opera, *La Cambiale di Matrimonio*, was produced at Venice when he was a youth of eighteen. But two years before this he had already received the prize at the Conservatorio of Bologna.
ROSSLYN, EARLS OF

for his cantata Il pianto d’armonia per la morte d’Orfeo. Between 1810 and 1813, at Bologna, Rome, Venice and Milan, Rossini produced operas of which the successes were varying. All memory of them is eclipsed in that of Tancrède. The libretto was an arrangement of Voltaire’s tragedy by J. A. Rossi. Traces of Paër and Paisiello were undeniably present in fragments of the music. But all critical feeling on the part of the public was drowned in the effect of sweetness and clarity produced by such melodies as “Mi rivedrai, ti rivëdrò” and “Di tanti palpiti,” the former of which became so popular that the Italians would sing it in crowds at the law courts until called upon by the judge to desist. Rossini continued to write operas for Venice and Milan during the next few years, but their reception was tame and in some cases unsatisfactory after the success of Tancrède. In 1815 he retired to his home at Bologna, where Barbaja, the impresario of the Naples theatre, who had once been a waiter in a coffee-house and now combined the business of theatrical management with that of farming the public gaming-tables, concluded an agreement with him by which he was to take the musical direction of the Teatro San Carlo and the Teatro Del Fondo at Naples, composing a new opera there each year. His fee was 5000 ducats (about £35 or $175) per month; he was also to receive a share in the gaming-tables amounting to about 1000 ducats (£75 or $875) per annum. The presence of Zingarelli and Paisiello in Naples was an incentive to intrigue against the success of the youthful composer, but all hostility was made futile by the enthusiasm which greeted the court performance of his Elisabetta regina d’Inghilterra, in which Isabella Colbran, who subsequently became the composer’s wife, took a leading part. The libretto of this opera by Schmidt was in many of its incidents an anticipation of those presented to the world a few years later in Scott’s Kenilworth. The opera was the first in which Rossini wrote the ornamens of the airs instead of leaving them to the fancy of the singers, and also the first in which the recitative secco was replaced by a recitative accompanied by a quartet of strings. In Almaviva, produced in the beginning of the next year in Rome, the libretto, a version of Beaumarchais’ Barber de Seville by Sterbini, was the same as that already used by Paisiello in his Barbier, an opera which had enjoyed European popularity for more than a quarter of a century. The indignation of Paisiello’s admirers expressed itself strongly on the production of the new setting, but in the thirteen days devoted to the composition of his Almaviva, Rossini had created such a masterpiece of musical comedy that the fame of Paisiello’s opera was transferred to his, to which the title of Il Barbier de Siviglia passed as an inalienable heritage. Between 1815 and 1823 Rossini produced twenty operas. Of these Otello formed the climax to his reform of serious opera, and offers a suggestive contrast with the treatment of the same subject at a similar point of artistic development by the composer Verdi. In Rossini’s time the tragic close was so distasteful to the public of Rome that it was necessary to invent a happy conclusion to Otello; and there are still places in Italy in which the Shakespearian end of the story can never be performed without interruption from the audience, who warn Desdemona of Otello’s deadly approach. Conditions of stage mechanism in 1817 and 1818 did not allow of the subject of Cinderella for a libretto only on the condition that the supernatural element should be omitted. The opera Cenerentola was ranked to be warded. The absence of such a similar precaution in the construction of his Mosè in Egitto led to disaster in the scene depicting the passage of the Israelites through the Red Sea, when the defects in stage contrivance always raised a laugh, so that the composer was at length compelled to introduce the chorus “Dal tuo stellato Soglio’” to divert attention from the dividing waves. In 1821, three years after the production of this work, Rossini married Isabella Colbran. In 1822 he directed his Cenerentola in Vienna, where Zelmira was also performed. After this he returned to Bologna; but an invitation from Prince Metternich to come to Verona and “assist in the general re-establishment of harmony” was too tempting to be refused, and he arrived at the Congress in time for its opening on the 20th of October 1822. Here he made friends with Chateaubriand and Madame de Liven. In 1823, at the suggestion of the manager of the King’s Theatre, London, he came to England, being much fêted on his way through Paris. In England he was given a generous welcome, which included an introduction to King George IV, and the receipt of £7000 after a residence of five months. In 1824 he became musical director of the Théâtre Italien in Paris at a salary of £800 per annum, and when the agreement came to an end he was rewarded with the offices of chief composer to the king and inspector-general of singing in France, to which was attached the same income. The production of his Guillaume Tell in 1829 brought his career as a writer of opera to a close. The libretto was by Étienne Joury and Hippolyte Bis, but their version was revised by Armand Marrast. The music is remarkable for its freedom from the conventions discovered and utilized by Rossini in his earlier works, and marks a transitional stage in the history of opera. In 1830 he returned to Bologna. His mother had died in 1827, and he was anxious to be with his father. Arrangements were made for a new agreement, but the terms were upset by the abdication of Charles X. and the July Revolution of 1830. Rossini, who had been considering the subject of Faust for a new opera, returned, however, to Paris in the November of that year. Six movements of his Stabat Mater were written in 1832 and the rest in 1839, the year of his father’s death, and the success of the work bears comparison with his achievements in opera; but his comparative silence during the period from 1832 to 1868 makes his biography appear almost like the narrative of two lives—the life of swift triumph, and the long life of seclusion, of which the biographers give us pictures in stories of the composer’s cynical wit, his speculations in fish culture, his mask of humility and indifference. His first wife died in 1845, and political disturbances in the Romagna compelled him to leave Bologna in 1847, the year of his second marriage with Olympe Pelissier, who had sat to Vernet for his picture of “Judith and Holofernes.” After living for a time in Florence he settled in Paris in 1855, where his house was a centre of artistic society. He died at his country house at Passy on the 13th of November 1868. He was a foreign associate of the Institute, grand officer of the Legion of Honour, and the recipient of innumerable orders. In his compositions Rossini plagiarized even more freely from himself than from other musicians, and few of his operas are without such admixtures frankly introduced in the form of arias or overtures. A characteristic mannerism in his musical writing earned him the nickname of “Monsieur Crescendo.” His music is associated with the names of the greatest singers in lyrical drama, such as Tamburini, Mario, Rubini, Delle Sedie, Albani, Grisi, Patti and Nilsson.

ROSSLAND, an important city in the Kootenay district of British Columbia, incorporated in 1897. Pop. (1907) 4033. It is situated in a valley 7 m. W. of Trail on the Columbia river and 8 m. N. of the international boundary. It has direct railroad communication with Trail and the Arrow lakes as well as with Northport and Spokane in the state of Washington. Rossland owes its importance to the immense deposits of iron pyrites and copper pyrites which occur in the vicinity. The best-known mines are the Le Roy, Centre Star and War Eagle. The city derives its electric light and power service from Bonnington Falls on the Kootenay river.

ROSSLAU, a town of Germany, in the duchy of Anhalt, on the right bank of the Elbe, here crossed by two railway bridges, 3 m. by rail N. of Dessau and 35 m. S.E. of Magdeburg. Pop. (1903) 11,027. It has a ducal residence, an old castle, a handsome parish church, and manufactures of machinery, paper, sealing-wax, wire goods, sugar, bricks and chemicals. Rosslau became a town in 1603.

ROSSLYN, EARLS OF. The first earl of Rosslyn was Alexander Wedderburn (see below), who was succeeded by his nephew, James St Clair Erskine (1762–1837), a son of...
ROSSLYN, 1st EARL OF—ROSSTREvor

Wedderburn's sister Janet by her marriage with Sir Henry Erskine (d. 1765), a Scottish baronet and soldier. Entering the army in 1776, James Erskine served in Portugal, in Denmark, and in the Netherlands, and became a general in 1814. From 1782 until 1809, when he became a peer, he was a member of parliament; a Tory politician and an associate of the duke of Wellington, he was lord privy seal in 1829-30 and lord president of the council in 1834-35. He inherited the estates of the family of St Clair and took this name in 1789, and he died on the 18th of January 1837. His son, James Alexander (1802-1866), became 3rd earl, and in 1850 the latter's grandson, James Francis Harry (b. 1869), became 5th earl.

ROSSLYN, ALEXANDER WEDDERBURN, 1ST EARL OF (1733-1803), Lord Chancellor of Great Britain, was the eldest son of Peter Wedderburn (a lord of session as Lord Chesterhall), and was born in East Lothian on the 13th of February 1733. He acquired the rudiments of his education at Dalkeith, and in his fourteenth year matriculated at the university of Edinburgh. It was from the first his desire to practise at the English bar, though in deference to his father's wishes he qualified as an advocate at Edinburgh in 1754, but instructed himself at the Inner Temple on the 8th of May 1753, so that he might keep the Easter and Trinity terms in that year. His father was called to the bench in 1755, and for the next three years Wedderburn stuck to his practice in Edinburgh, during which period he employed his oratorical powers in the General Assembly of the Church of Scotland, and passed his evenings in the social and argumentative clubs which abound in Edinburgh. In 1755 the precursor of the later Edinburgh Review was started, now chiefly remembered because in its pages Adam Smith criticized the dictionary of Dr Johnson, and because the contents of its two numbers were edited by Wedderburn. The dean of faculty at this time, Lockhart, afterwards Lord Covington, a lawyer notorious for his harsh demeanour, in the autumn of 1757 assailed Wedderburn with more than ordinary insolence. His victim retorted with extraordinary powers of inventive, and, on being rebuked by the bench declined to retract or apologize, but placed his gown upon the table, and with a low bow left the court for ever. He was called to the English bar at the Inner Temple in 1757. To shake off his native accent and to acquire the graces of oratorical action, he engaged the services of Thomas Sheridan and Charles Macklin. To secure business and to conduct his cases with adequate knowledge, he studied the forms of English law, he solicited William Strahan, the printer, "to get him employed in city causes," and he entered into social intercourse (as is noted in Alexander Carlyle's biography) with busy London solicitors. His local connexions and the incidents of his previous career introduced him to the notice of his countrymen Lords Bute and Mansfield. When Lord Bute was prime minister this legal satellite used, says Dr Johnson, to go on errands for him, and it is to Wedderburn's credit that he first suggested to the premier the propriety of granting Johnson a pension. Through the favour of Lord Bute, he was returned to parliament for the Ayr burghs in 1761. In 1763 he became king's counsel and the solicitor's of John Baylis and a brother went the northern circuits, but he was more successful in obtaining business in the Court of Chancery. He obtained a considerable addition to his resources (Carlyle puts the amount at £10,000) on his marriage in 1767 to Betty Anne, sole child and heiress of John Dawson of Marly in Yorkshire. When George Grenville, whose principles leaned to Toryism, quarrelled with the court, Wedderburn affected to regard him as his leader in politics. At the dissolution in the spring of 1768 he was returned by Sir Lawrence Dundas for Richmond as a Tory, but in the questions that arose over John Wilkes (q.v.) the popular side of "Wilkes and liberty," and resigned his seat in May 1769. In the opinion of the people he was now regarded as the embodiment of all legal virtue; his health was restored at the dinners of the Whigs amid rounds of applause, and, in recompense for the loss of his seat in parliament, he was returned by Lord Clive for his pocket-borough of Bishop's Castle, in Shropshire, in January 1770. During the next session he acted vigorously in opposition, but his conduct was always viewed with distrust by his new associates, and his attacks on the ministry of Lord North grew less and less proportionate to its apparent vacuity of tenure. In January 1771 he was offered and accepted the post of solicitor-general. The high road to the woolsack was now open, but his defection from his former path has stamped his character with general infamy. Junius wrote of him, "As for Mr Wedderburn, there is something about him which even treachery cannot trust," and Colonel Barré attacked him in the House of Commons. The new law officer defended his conduct with the assertion that his alliance in politics had been with Mr George Grenville, and that the connexion had been severed on his death. All through the American War he consistently declaimed against the colonies, and he was bitter in his attack on Benjamin Franklin (q.v.) before the Privy Council. In June 1778 Wedderburn was promoted to the post of attorney-general, and in the same year he refused the dignity of chief baron of the exchequer because the offer was not accompanied by the promise of a peerage. At the dissolution in 1774 he had been returned for Okehampton in the new county, and supported the former constituency; on his promotion as leading law officer of the crown he returned to Bishop's Castle. The coveted peerage was not long delayed. In June 1780 he was created chief justice of the Court of Common Pleas, with the title of Baron Loughborough.

During the existence of the coalition ministry of North and Fox, the great seal was in commission (April to December 1783), and Lord Loughborough held the leading place among the commissioners. For some time after that ministry's fall he was considered the leader of the Whig party in the House of Lords, and, had the illness of the king brought about the return of the Whigs to power, the great seal would have been placed in his hands. The king's restoration to health secured Pitt's continuance in office, and disappointed the expectations of the Whigs. In 1792, during the period of the French Revolution, Lord Loughborough succeeded from Fox, and on the 28th of January 1793 rode to the great seal in the Tory cabinet of Pitt. The resignation of Pitt on the question of Catholic emancipation (1801) put an end to Wedderburn's tenure of the Lord Chancellorship, for, much to his surprise, no place was found for him in Addington's cabinet. His first wife died in 1781 without leaving issue, and he married in the following year Charlotte, youngest daughter of William, Viscount Courtenay; but her only son died in childhood. Lord Loughborough accordingly obtained in 1795 a re-grant of his barony with remainder to his nephew, Sir James St Clair Erskine. His fall in 1801 was softened by the grant of an earldom (he was created earl of Rosslyn 21st April 1801, with remainder to his nephew), and by a pension of £4000 per annum. After this date he rarely appeared in public, but he was a constant figure at all the royal festivities. He attended one of those gatherings at Frogmore, on the 31st of December 1804. On the following day he was seized with an attack of gout in the stomach, and on the 1st of January 1805 he died at his seat, Baylis, near Salt Hill, Windsor. His remains were buried in St Paul's Cathedral on the 11th of January.

At the bar Wedderburn was the most elegant speaker of his time, and, although his knowledge of the principles and precedents of law was deficient, his skill in marshalling facts and his clearness of expression were admired even by his opponents. He was remarkable for his perspicacity, particularly in the appeal cases to the House of Lords. For cool and sustained declamation he stood unrivalled in parliament, and his readiness in debate was universally acknowledged. In a speech on the death of his wife, which he delivered on the 21st of February 1804, he said: "In her he found in life, in her he sought in death... Her modesty and purity absolved all repute of principle, but the love of money for money's sake was not among his faults."

See Brougham's Statesmen of the Reign of George III; Foss's Judges; Campbell's Lives of Lord Chancellor. (W. P. C.)

ROSTREvor, a watering-place of county Down, Ireland, on Carlingford Lough. See WARE POINT.
ROSSWEIN—ROSTOPTSCHIN

ROSSWEIN, a town in Germany, in the kingdom of Saxony, situated on the Freiberger Mulde, 46 m. S.E. from Leipzig by the railway via Döbeln; Pop. (1895) 9297. It is famous for its technical schools, among which are one for builders, another for furniture-makers, and a third for ironmongers. The industries are considerable, and include woolen and cloth manufactures, dyeing, spinning, and the making of agricultural machinery, cigars, chemicals, bricks and iron goods. Rosswein is an old town, cloth-making being a flourishing industry here in the 14th century.

See C. V. Böhmert, Die Stadt Rosswein, 1883-94 (Dresden, 1895).

ROSTAND, EDMOND (1869— ), French dramatist, was born on the 1st of April 1869, the son of Joseph Eugène Herbert Rostand (b. 1843), a prominent journalist and economist of Metz. His first play, a burlesque, Les romanesques, was produced on the 21st of May 1894 at the Théâtre Français. He took the motive of his second piece, La Princesse lointaine (Théâtre de la Renaissance, 5th April 1895), from the story of the troublesome Rudel and the Lady of Tripoli. The part of Mélissande was created by Sarah Bernhardt, who also was the original Photine of La Samaritaine (Théâtre de la Renaissance, 14th April 1897), a Biblical drama in three scenes taken from the gospel story of the woman of Samaria. The production of his "heroic comedy" of Cyrano de Bergerac (28th December 1897, Théâtre de la Porte Saint-Martin), with Coquelin in the title rôle, was a triumph. No such enthusiasm for a drama in verse had been known since the days of Hugo's Hernani. The play was quickly translated into English, German, Russian and other European languages. For his hero he had drawn on French 17th-century history; in L'Aiglon he chose a subject from Napoleonic legend, suggested probably by Henri Welschinger's Rois de Rome (1871-32 (1897)), which contained much new information about the unhappy life of the duke of Reichstadt, son of Napoleon I. and Marie Louise, under the surveillance of Metternich at the palace of Schönbrunn. L'Aiglon, in verse was produced (11th March 1902) by Sarah Bernhardt at her own theatre, she herself undertaking the part of the duke of Reichstadt. In 1902 Rostand was elected to the French Academy. His Chantecler, produced in February 1910, was awaited with an interest (enhanced by considerable delay in the production) hardly equalled by the enthusiasm of its reception. Lucien Guity was in the title rôle and Mme. Simone played the part of the pheasant, the play being a fantasy of bird and animal life, and the characters denizens of the farmyard and the woods. Rostand's wife, née Rosemonde Étienne Gérard, published in 1890 Les Pépèux, a volume of verse crowned by the Academy.

See a notice by Henry James in vol. 84, pp. 477 sqq. of the Cornhill Magazine.

ROSTOCK, a town of Germany, in the grand duchy of Mecklenburg-Schwerin, one of the most important commercial cities on the Baltic. It is situated on the left bank of the estuary of the Warnow, 8 m. from the port of Warnemünde on the Baltic, 177 m. N.W. of Berlin by rail, 80 m. N.E. of Lübeck, and 106 m. S. of Copenhagen. Pop. (1905) 60,790. It consists of three parts—the old town to the east, the middle and new towns to the west—of which the first retains some of the antique features of a Hanse town, while the last two are for the most part regularly and handsomely built. There are also several suburbs. The town has four gates, one of them dating from the 14th century, and some fine squares, among them the Blücher Platz, with a statue of Blücher, who was born here, and the Neue Markt. Rostock was a fortress of some strength, but the old fortifications have been razed, and their site is occupied by promenades. Rostock has five old churches: St Mary's, dating from 1398 to 1472, one of the most imposing Gothic buildings in Mecklenburg; with two Romanesque towers and containing a magnificent bronze font and a curious clock; St Nicholas, begun about 1250 and restored in 1450, and again in 1890-94; St Peter's, with a lofty tower over 400 ft. high, built in 1400, which serves as a landmark to ships at sea; St James's, completed in 1588, and the church of the Holy Rood, begun in 1270. St Mary's church contains a monument marking the tomb of Hugo Grotius, who died in Rostock in 1645, though his remains were afterwards removed to Delft. Among other interesting buildings are the curious 14th-century Gothic town hall, the façade of which is concealed by a Renaissance addition; the palace of the grand duke of Mecklenburg-Schwerin, built in 1702; the law courts, built in 1788-79; the university buildings, erected in 1867-70; and an assembly hall of the estates of Mecklenburg (Ständehaus), a handsome Gothic building erected in 1889-93.

The university of Rostock was founded in 1418 by Dukes Johann III. and Abrecht V. of Mecklenburg. From 1437 till 1443 it was continued at the Elbe, at the port of the town of Rostock; and in 1760 it was again removed, on this occasion to Bützow. The professors appointed by the city, however, still taught at Rostock, so that there were practically two universities in the duchy until 1789, when they were reunited at the original seat. Rostock is the seat of the supreme court for both the duchies of Mecklenburg, and is well equipped with schools, hospitals, and other institutions.

Although the population, commerce and wealth of Rostock have declined since Hanse days, it has a considerable trade, being the chief commercial town of Mecklenburg and owning a considerable fleet. Vessels drawing 16 ft. of water are able to get up to the wharves. By far the most important export is grain, which goes almost entirely to the Baltic; timber is also exported. The chief imports are coal from Great Britain, herrings from Sweden, petroleum from America, timber, vine and colonial goods. Rostock has an important fair at Whitsun, lasting for four days, in which hemp and wool are also sold, and also a market, which is of importance for the industries of the town are varied. One of the chief is shipbuilding. Machinery, chemicals, sugar, malt, paper, musical instruments, cotton, straw hats, tobacco, carpets, soap, playing cards, chocolate and tobacco are among the manufactures. The town also contains distilleries, saw-mills, oil-mills, tanneries, breweries and electrical works.

Local historians assert that a village existed on the site of Rostock as early as a.D. 329, but no certain proofs have been traced of any earlier community than that founded here in the 12th century, which is said to have received municipal rights in 1218. The earliest signs of commercial prosperity date from about 1260. For a time Rostock was under the dominion of the kings of Denmark. Soon after returning under the protection of Mecklenburg in the 14th century it joined the Hanseatic League, and was one of the screen-painters of the powerful Wendish Hansa, in which it exercised an influence second only to that of Lübeck. The most prosperous epoch of its commercial history began in the latter half of the 15th century, precisely at the period when its political power began to wane. Rostock, however, never entirely lost the independence which it enjoyed as a Hanse town; and in 1788, as the result of long contentions with the rulers of Mecklenburg, it secured for itself a peculiar and liberal municipal constitution, administered by three burgomasters and three chambers. In 1880 this constitution was somewhat modified, and the city became less like a state within a state. It has belonged to Mecklenburg-Schwerin since 1605; in 1712 it was taken by the Swedes, in 1715 by the Danes and in 1716 by the Russians. The badge of Rostock is the figure 7; and a local rhyme explains that there are 7 doors to St Mary's church, 7 streets from the market-place, 7 gates on the landward side and 7 wharves at the seaward side of the town. 7 turrets on the town-hall, which has 7 bells, and 7 Linden trees in the park.

ROSTOPTSCHIN, COUNT FEODOR VASSILIEVICH (1763-1826), Russian general, was born on the 23rd of March 1763, in the government of Orel. He had great influence with the Tsar Paul, who made him 1796 adjutant general, grand-marshal of the court, then minister of the interior. In 1799 he received the title of count. He was disgraced in 1801 for his opposition to the French alliance, but was restored to...
favour in 1810, and was shortly afterwards appointed military governor of Moscow. He was therefore charged with its defence against Napoleon, and took every means to rouse the nation of the town and district against the invader. He has been generally charged with instigating the burning of Moscow the day after the French had made their entry; it is certain that the prisons were opened by his order, and that he took no means to stop the outbreak. He defended himself against the charge of incendiarism in a pamphlet printed in Paris in 1823, La Vérité sur l'incendie de Moscou, but he subsequently made grave admissions. Shortly after the congress of Vienna, to which he had accompanied the Tsar Alexander, he was disgraced. He only returned to Russia in 1825, and died at Moscow on the 12th of February of the next year.

Its Mémoires écrits en dix minutes were posthumously published at St Petersburg in 1853, his Oeuvres inédites in Paris in 1894. A partial account of his life was written by his grandson A. de Séguir (Paris, 1872). See also Varnhagen von Ense, Denkwürdigkeiten, vol. i.; G. Treffort, Wer hat Moskau im Jahre 1812 in Brand gesteckt (Berlin, 1900).

ROSTOV-ON-THE-DON, a seaport in the territory of the Don Cossacks, well situated on the right high bank of the Don, 13 m. from its mouth in the Sea of Azov. In 1731 a small fort was erected on an island in the Don, near its mouth. Thirty years later the fortifications were transferred to the site now occupied by Rostov, 5 m. above the head of the famous delta of the Don. Rostov, which has here a breadth of 250 to 300 yds., with a hardly perceptible current, offers an excellent roadstead. The navigation, however, is considerably impeded by the shallowness of the river. Dredging operations have but partially remedied this. Moreover, the river is forbidding for more than one hundred days in the year. The population has grown rapidly: while in 1811 it was 70,000, in 1870 it numbered 116,880, and in 1905 126,375, exclusive of the suburbs; if these, which comprise Nakichevane (32,382 in 1905) be included, the population is well over 160,000, a figure which is still further swollen in the summer by the influx of about 60,000 men, who find work in connexion with the shipment of grain for export. The permanent population includes 15,000 Jews, 5000 Armenians, with Tatars, Poles, Germans and others. In Nakichevane there are 20,000 Armenians. Owing to its situation on the navigable river Don and at the junction of three railways, radiating to north-western Russia, Caucasus and the Volga respectively, Rostov has become the chief seaport of south-eastern Russia, being second in importance on the Black Sea to Odessa only. It is the chief centre for the supply of agricultural machinery to the steppe governments of south-eastern Russia. On an average, £3,000,000 to £4,000,000 worth of wheat, about £1,000,000 worth of rye, and over £1,500,000 worth of barley are exported annually, besides oats, flax, linseed, rape seed, oilcake, bran, flour, vegetable oils, raw wool and caviare. The imports average between four and five millions sterling annually, and consist largely of agricultural machinery. There are a shipbuilding yard, flour-mills, tobacco factories, iron works, machinery works, distilleries, soap works, timber mills, bell foundries, paper mills and rope works. Rostov is the chief centre of steam flour-mills for south-eastern Russia and Caucasus. Two fairs, one of which has considerable importance for the whole of south-eastern Russia, are held here yearly. Rostov has excellent fisheries. The town has a cathedral, a fine town hall (1897-99), navigation schools, technical schools, and a good municipal library.

ROSTOV VELIKIY, a town of Russia, in the government of Yaroslavl, 35 m. by rail S.W. of the town of Yaroslavl, near Lake Rostov or Nero. Pop. (1897) 14,342. It has numerous cotton and linen mills. The great fair for which it was formerly famous has lost its importance, but the town remains the centre of a variety of domestic trades—tailoring, the manufacture of leather, and the making of boots and small enamelled ikons (sacred images); it is also famous for its kitchen gardening and the export of pickled and dried vegetables and medical herbs. Fishing is carried on. The restoration of the buildings (royal palace, archiepiscopal palace, and five churches) of the Kremlin or citadel was begun in 1902. The other public buildings include six 17th-century churches, a museum and a cathedral, consecrated in 1231 and having its interior walls covered with paintings.

Rostov was founded by Slavs in or before 862, and played so prominent a rôle in the history of that part of Russia that it used to be known as Rostov the Great. From the beginning of the 11th century to the 13th it was the chief town of a territory which included large parts of the present governments of Yaroslavl, Vladimir and Novgorod. After the Mongol invasion of 1230-42 it rapidly declined, and in 1474 it was purchased by Ivan III. and annexed to Moscow. It was repeatedly plundered by Tatars, Livonians and Poles in the 15th, 16th and 17th centuries.

ROSTRA ("beaks"), in Roman antiquities, the orators' platform, which originally stood between the comitium and the forum proper, opposite the curia. It is not known when it was erected, but in 338 B.C. it was decorated by Gaius Maenius with the prows of ships captured from the people of Antium (Livy viii. 14). From that time it was called rostra, having previously been known as templum (literally "consecrated place"), since it had been consecrated by the augurs (Cicero, In Vatium, x. 24). Some, however, deny the identity of the templum and rostra. On the platform or hard by were exhibited the state statues of the emperors (Caesars), and state documents and memorials (the laws of the Twelve Tables, the treaty with the Latins, the columna rostralis of Dullius). Caesar had it pulled down, intending that it should be rebuilt on the west side of the forum, but it was left for Augustus (or Mark Antony) to carry out his plan. The term rostra, often used by classical authors, in connexion with funeral orations, makes it doubtful whether the old platform was entirely demolished, unless the name was simply transferred to the new rostra of Augustus. This consisted of a rectangular platform, 78 ft. long, 33 ft. broad and 11 ft. above the level of the forum pavement. It was reached by steps from the back; in front there was a marble balustrade with an opening in the centre where the speaker stood, possibly also intended for a staircase leading down into the forum. In the existing remains the holes in which the beaks of the ships were fastened, arranged in pairs, are visible. Behind these remains, close to the Clivus Capito linus, a row of light lowarched cells has been found, which, owing to a certain resemblance to the earlier rostra as shown on the well-known coin of Lollia Pal fianus, has been identified by Boni with the rostra removed by Julius Caesar, the other remains being attributed to the time of Domitian (for objections to this theory, see Hillen and Richter). In the time of Hadrian the side balustrades were decorated with marble slabs, on which were represented in relief the burning of the lists of the citizens who were in arrears to the fisc and the distribution of necessaries to the poorer citizens. Thédat explains the first as Domitian reassuring a deputation of citizens by burning the denunciatory reports of the delatores, and the second (the scene of which he places at the Rostra Julia) as the promulgation of the law forbidding the mutilation of children. The erection of the arch of Severus necessitated considerable alterations, the most important of which was a triangular courtyard cut out of the north half of the rostra, to allow direct access to it from the side that faced the arch, its breadth being thereby reduced by a third. A later extension of the façade northwards is explained by a long inscription, recording that about the year 470, Ulpius Junius Valentinus, a city prefect, restored the structure (hence called Rostra Vandalica) after a naval victory over the Vandals. A relief on the arch of Constantine represents the emperor speaking from the rostra.

The Rostra Julia was a platform with a semicircular niche

3 The Lat. singular rostrum, a beak, the beak of a ship, is used in English of a platform, stand or pulpit from which a speaker addresses his audience. It is also used in its original meaning of a beak-like prolongation or process in zoology or botany.
in the centre, in front of the Aedes divi Iulii, built by Augustus on the spot where the body of Caesar was cremated. The niche was probably used to support the bier while a funeral laudatio was being delivered. The front on either side was decorated with the beaks of ships captured at the battle of Actium.

ROTA, COURT OF, one of the departments of the medieval papal organization, existing alongside the Dataria, the Poenitentiaria, the two Signatures (S. Gratiae and S. Justitiae), and other bureaux. The Rota was the supreme court of Christendom. It consisted of twelve members, three from Rome, two from Spain, one each from Bologna, Ferrara, Venice, Milan, Germany, France, and (alternately) Tuscany or Perugia. It declined in importance when the Signatura Justiniana set above it as the court of appeal for Italy, and more so as the geographical jurisdiction of the pope was gradually lessened. After the Council of Trent the old arrangements were replaced by the Congregations, permanent committees of cardinals which deal with definite branches of business. The Rota, however, was restored to its functions as supreme court of appeal by Pope Pius X. in 1908 (see CURIA ROMANA)

ROTH, JUSTUS LUDWIG ADOLF (1818-1892), German geologist and mineralogist, was born at Hamburg on the 15th of September 1818. In 1847 he was appointed professor of mineralogy at the university of Berlin. He may be regarded as one of the founders of petrographical science. In his published papers he dealt with metamorphism and crystalline schists, discussed the origin of serpentines, and wrote on Vesuvian rocks and on Ponza Island. His separate works included Der Vesuv und die Umgebung von Neapel (1857); Beiträge zur Petrographie der platonischen Gesteine (1859-84); Allgemeine und chemische Geologie (3 vols., 1879-93); and Über die Erdbeben (1855-1887). He died at Berlin on the 14th of April 1897.

ROTHE, RICHARD (1799-1867), Luthertian theologian, was born at Posen on the 28th of January 1799. He studied theology in the universities of Heidelberg and Berlin (1817-20) under Karl Daub (1756-1835), Schleiermacher and Neander, the philosophers and historians Georg Hegel, Friedrich Creuzer (1711-1818) and F. C. Schlosser (1776-1861) exercising a considerable influence in shaping his thought. From 1820 to 1822 he was in the clerical seminary at Wittenberg. In the autumn of 1823 he was appointed chaplain to the Prussian embassy in Rome, of which Baron Bunsen was the head. This post he exchanged in 1825 for a professorship in the Wittenberg theological seminary, of which in 1832 he became also second director and ephorus, and hence in 1837 he removed to Heidelberg as professor and director of a new clerical seminary; in 1849 he accepted an invitation to Bonn as professor and university preacher, but in 1854 he returned to Heidelberg as professor of theology, and afterwards became member of the Oberkirchprälat, a position he held until his death on the 20th of August 1867. As a man he had a keen interest in a supernatural mysticism; his chosen authors were those of the romantic school, and Novalis remained throughout his life a special favourite. In Berlin and Wittenberg he came under the influence of Pietism as represented by such men as Rudolf Stier (1800-1862) and Friedrich Tholuck, though Tholuck pronounced him a "very modern Christian." He afterwards confessed that, though he had been a sincere, he was never a happy, Pietist. In Rome, under the broadening influence of classical and ecclesiastical art, he learned to look at Christianity in its human and universalistic aspects, and began to develop his great idea, the inseparable relation of religion and morals. He began then, and particularly after the revolution of July 1830, likewise to give a more definite form to his peculiar view of the relations of church and state. He thus became out of harmony with the pietistic thought and life of Wittenberg. His removal to Heidelberg and the publication of his first important work, Die Anfänge der christlichen Kirche und ihrer Verfassung (1837), coincide with the attainment of the principal theological positions with which his name is associated. During the middle period of his career (1837-61) he led the life of a scholastic recluse. During the last six years of his life he came forward as the advocate of a free theology and of the Protestantenverein.

Roth was one of the most profound and influential of modern German theologians. Like Schleiermacher he combined with the keenest logical faculty an intensely religious spirit, while his philosophical tendencies were in sympathy rather with Hegel than with Kant, and though he never held the doctrines of the latter to him than the abstractions of Spinoza, to whom Schleiermacher owed so much. He classed himself among the theosophists, and claimed to be a convinced, and happy supernaturalist in a scientific sense. In his view the universe is a vast machine, of the elements, and the cosmic spirit is not peculiar, but is a complex of the fantastic, a constructed, by a profound, comprehensive, fearless and logical mind. A peculiarity of his thought was the realistic nature of his thought, which was, as it were, the whole, but he died when he had completed the first two volumes. The remainder was reprinted from the first edition by Professor Heinrich Holtzmann, with the addition of some notes and emendations left by the author.

The Theologische Ethik begins with a general sketch of the author's system of speculative theology in its two divisions, theology proper and cosmology, cosmology falling into the two subdivisions of Physik (the world of nature) and Ethik (the world of spirit). It is the last of the treatises which forms the work. After an analysis of the religious consciousness, which yields the doctrine of an absolute personal and spiritual God, Roth proceeds to deduce from his idea of God the process and history of creative development, with its eternal and unchangeable character, and its ultimate purpose, worlds of spirits, partially self-creative and sharing the absolute personality of the Creator. Roth regards the natural man as the consummation of the development of physical and intellectual man, as the necessary preparation of the divine and of the human spirit of the world. The further development is the moral and religious vocation of man; this higher stage is self-determination, the performance of every human function as a voluntary and intelligent agent, or as a person, having as its end the full realization of the spiritualization of the world. Piety, that it may become truth and reality, demands morality as its fulfillment, as the only concrete element in which the idea of fellowship with God is realized; morality, that it may find its perfect unfolding, requires the moral law in the law of human nature; if the moral law is to be a vindicated, it must be a universal law, true in all its breadth and depth. &quot;The process of human development Rothu...&quot;
the religious and the moral life will vanish, and the Christian state, as the highest sphere of human life representing all human functions, will displace the church. In proportion as the Saviour Christianizes the state by means of the church must the progressive completion of the structure of the church prove the cause of its abolition. The decline of the church is therefore not to be deplored, but recognized as the consequence of the independence and completeness of the Christian life. It is the third section of his work—the Pflichtenlehre—of which generally most high valued, and which is full strength as an ethical thinker is displayed, without any mixture of theosophic speculation.

Since Roho's death several volumes of his sermons and of his lectures (the history of homiletics) and a collection of brief essays and religious meditations under the title of Stille Stunden (Wittenberg, 1872) have been published.

Rothelin—Rothenburg, Earls of

Rothelin, Jacqueline de Rohan, marquise de (c. 1535–1587), daughter of Charles de Rohan and Jeanne de Saint-Séverin. She married François de Sillery, marquis de Rohelin, died in 1548, and in watching her son's interests in Neuchâtel she was brought into contact with the reformers in Switzerland. She then embraced Protestantism and turned her château at Blandy, in Brie, into a refuge for Huguenots. In 1567 she underwent a term of imprisonment at the Louvre for harbouuring Protestants.

Rothenburg-ob-der-Tauber, a town in Germany, in the kingdom of Bavaria, 49 m. by rail S.W. of Nuremberg. Pop. (1905) 8436. It is beautifully situated on an eminence 200 ft. above the Tauber. It is flanked by medieval walls, towers and gates, and its antique appearance has been carefully preserved. Perhaps the most interesting building is the town hall, one part of which dates from 1240 and the other from 1572. The latter is a beautiful Renaissance structure, with a magnificent façade and a delicate spire, and contains a grand hall, the Kaiseraal, in which every Whit Monday a play, Der Meisterspuck, which commemorated the capture of the town by the Turks in 1552, was performed. Other buildings are the Gothic church of St James, with curiously carved altars and beautiful stained-glass windows, and containing in the Toppler chapel the tomb of the burgomaster, Heinrich Toppler; the 15th-century church of St Wolfgang; the Franciscan church; and five other churches. The town has many picturesque houses, and possesses a library with some interesting archives. It has manufactures of toys and agricultural machinery, electrical works and breweries.

Rothenburg-ob-der-Tauber, mentioned in the chronicles in 804 as Rotinhere, was probably a residence of the dukes of Franconia. It first appears as a town in 942 and until 1108 was the seat of the counts of Rothenburg-Komburg; when this line became extinct it passed to the family of Hohenstaufen, one member of which took the title of duke of Rothenburg. In 1172 it became a free imperial city and it attained the zenith of its prosperity under the famous burgomaster Heinrich Toppler (1350–1408). It took part in the movements in South Germany during the 15th and 16th centuries. In 1631 Rothenburg was stormed by Tilly, and the cup of wine presented by the burgomaster, which, according to tradition, saved the town from destruction, is annually commemorated in the play mentioned above.

See Bensen. Beschreibung und Geschichte der Stadt Rothenburg (Erlangen, 1856); Merz, Rothenburg in alter und neuer Zeit (2nd ed., Ansbach, 1881); Schultheiss, Rothenburg, ein Städtleib (Zürich, 1892) and Das Festspiel zu Rothenburg-ob-der-Tauber (Munich, 1892); and W. Klein, Führer durch die Stadt Rothenburg (Rothenburg, 1888).

Rotherham, Thomas (1423–1500), archbishop of York, also called Thomas Scott, was born at Rotherham on the 24th of August 1423; he was educated in his native town and seems to have been connected with both the universities of Oxford and Cambridge. Having entered the church he became rector of Ripple, Worcestershire, and later of St Vedast, Foster Lane, London, and it was probably when he was chaplain to John de Vere, earl of Oxford, that he made the acquaintance of Elizabeth Woodville, afterwards the queen of Edward IV. In 1467 Rotherham became keeper of the privy seal to this king; in 1468 he was appointed bishop of Worcester, in 1472 bishop of Lincoln and in 1475 chancellor of England. Several times he went to France on public business; in 1475 at the treaty of Picquigny he received a pension from Louis XI. of France, and in 1480 he was chosen archbishop of York. When Edward IV, died in April 1483 the archbishop remained true to his widow Elizabeth, and consequently lost the chancellorship and was put into prison by Richard III. He was soon set at liberty, and he died in 1500 at Cawood, near York. At Oxford Rotherham built part of Lincoln College and increased its endowment; at Cambridge, where he was chancellor and master of Pembroke Hall, he helped to build the University Library. He founded a college at Rotherham, which was suppressed under Edward VI., and he was responsible for the building of part of the church of All Saints there.

Rotherham, a market-town and municipal borough in the Rotherham parliamentary division of the West Riding of Yorkshire, England, 3 m. N.E. of Sheffield, on the Midland, North-Eastern and Great Central railways. Pop. (1891) 42,061; (1901) 54,349. It lies in the valley of the Don, where that river is joined by the Rother, and has communication by water with the Humber. The Don is crossed by a bridge on which is a small ancient building, formerly a chapel. The parish church of All Saints, occupying the site of a building dating from Anglo-Saxon times, was erected in the reign of Edward IV., and is among the best specimens of Perpendicular in the north of England. The town possesses iron, steel and brass works, railway wagon works, potteries, glass-works, breweries, saw-mills and rope-yards. At the township of Masbrogh, opposite Rotherham across the Don, works were established in 1746 by Samuel Walker, a successful ironmaster. The municipal borough, incorporated in 1871, is under a mayor, 6 aldermen and 18 councillors. Area, 6012 acres.

The town was of some importance in Anglo-Saxon times, and at Templeborough, on the S.E. side of Rotherham, there was a Roman fort, but its traces are effaced. In the time of Edward the Confessor, Rotherham possessed a market and a church. During the Civil War it sided with the Parliament. It was taken by the Royalists in 1643, but after the victory of Marston Moor was yielded to a detachment of the Parliamentary forces.

Rothes, Earls of. The first earl of Rothes was George Leslie, son of Norman Leslie of Rothes in Moray, and of Balnabreach in Fife. In 1443 he was created Baron Leslie of Leven, and about 1458 earl of Rothes in the peerage of Scotland. His grandson was George, the 4th (d. 1558), whose father, William, the 3rd earl, was killed at Flodden, was accused, and acquitted in 1546, of complicity in the murder of Cardinal Beaton, in which his brother and his two sons were undoubtedly implicated; he was one of the Scottish commissioners who witnessed the marriage of Mary queen of Scots with Francis, the dauphin of France. His son Andrew, 5th earl of Rothes (d. 1611), took an active part with the lords of the congregation, first against the queen-mother, Mary of Guise, when regent of Scotland, and afterwards against Mary queen of Scots in opposing her marriage with Darnley, and in devising the murder of Rizzio. He was, however, one of the peers who acquitted Bothwell of Darnley's murder; and going over to the side of the queen, he fought for her at Langside. He continued to occupy a position of some prominence in Scottish affairs until his death in 1611. His great-grandson, John, 7th earl of Rothes (1630–1687), held a command in the Royalist army at the battle of Worcester in 1651, and accompanied Charles II. to England at the Restoration, when he became
lord president of the council in Scotland. He was lord treasurer of Scotland from 1663 till 1667, when he was made lord chancellor of Scotland for life. His time, having been sequestered by the parliament in 1651, he received a re-statement of the earldom of Rothes, together with the title of Lord Leslie and Ballinbreich, with remainders to his heirs male and female, providing that in every case where a female should succeed to the peerage the name of Leslie should be assumed by her husband. In 1680 the earl was advanced to the dignity of duke of Rothes and marquess of Ballinbreich, but these titles became extinct at his death without a son in the following year. The earldom of Rothes and the other older titles now passed, under the special remainder mentioned above, to his daughter Margaret, whose husband, Charles Hamilton, 5th earl of Haddington, accordingly took the name of Leslie, at the same time making an arrangement by which his own peerage should pass to a younger son in order to keep the two earldoms separate. Margaret's son John, who on her death became 9th earl of Rothes, was vice-admiral of Scotland from 1715 to 1722, and fought with distinction against the Jacobite rebels in 1715; and her grandson, the 10th earl, who sold the estates of Ballinbreich to the Dundas family, was commander-in-chief in Ireland in 1754, and became a general in 1765. The office of sheriff of Fife, which had been an hereditary right of the earls of Rothes since 1540, was sold by the 10th earl under the Heritable Act of 1747. On several subsequent occasions the earls again espoused the female line, and in 1803 Mary Elizabeth, countess of Rothes in her own right, was succeeded by her grandson, Norman Evelyn Leslie (b. 1877), as 19th earl of Rothes.

ROTHESAY, a royal, municipal and police burgh, and the chief town of the county and island of Bute, Scotland. Pop. (1901) 9378. It is situated on a beautiful bay, 40 m. S.W. of Glasgow, with which there is regular communication by railway steamers from Wemyss Bay, Gourock, Greenock (Prince's Pier) and Craigendoran, as well as by many other steamers from Glasgow and the Clyde ports. It is a popular watering-place, and as the bay is sheltered by low wooded hills and affords excellent anchorage, it is well patronized by yachts. Loch Striven, on the opposite shore of Argyllshire, is known as the "Rothsay weather-glass," its appearance furnishing a certain clue to meteorological conditions. The town is under the jurisdiction of a provost and council. Rothsay has ceased to be a manufacturing centre, fishing being now its chief industry. Owing to its mild and equable climate it is a Sea of Firths. There is a tramway to Port Bannatyne, pleasantly situated on the east horn of Kames Bay, and Craigmore, about 1 m. west of Rothsay, is a fashionable suburb. Ard Beg Point, Loch Fad, Loch Aseg and Barone Hill (330 ft.) are all within a mile and a half of the town, and there are numerous excursions by road to other points of interest. The Kyles of Bute are a short sail of Rothsay. In the centre of the town are the ruins of a castle erected in 1098 either by Magnus Barefoot, king of Norway, or by the Scots as a defence against the Norwegians, with whom during the 13th century, and earlier, there was constant strife. The village which grew up round the castle was made a royal burgh by Robert III., who, in 1308, created his eldest son David duke of Rothsay, a title which became the highest Scottish title of the heir-apparent to the crown of the United Kingdom. During the Commonwealth the castle was garrisoned by Cromwell's troops. It was burned by the followers of Argyll in 1685, and remained neglected till the rubbish was cleared away by the second marquess of Bute in 1816. It was repaired by the third marquess.

ROTHSCHILD. The name of a Jewish family which has acquired an unexampled position from the magnitude of its financial transactions. The original name was Bauer, the founder of the house being Mayer Anselm (1734-1812), the son of Anselm Moses Bauer, a small Jewish merchant of Frankfort-on-the-Main. His father wished him to become a rabbi, but he set up as a money-lender at the sign of the "Red Shield" (Rothschild) in the Frankfort Judengasse. He had already attained a certain success when his aggressive tactics obtained for him the friendship of William, ninth lord Bute, and afterwards elector of Hesse-Cassel, who in 1801 made him his agent. In the following year Rothschild negotiated his first great government loan, ten million thalers for the Danish government. When the landgrave was compelled to flee from his capital on the entry of the French, he placed his silver and other bulky treasures in the hands of Rothschild, who, not without considerable risk, took charge of them and buried them, it is said, in a corner of his garden, whence he dug them up as opportunity arose for disposing of them. This he did to such advantage as to be able afterwards to return their value to the elector at 5% interest. He died at Frankfort on the 19th of September 1812, leaving ten children, five sons and five daughters. Branches of the business were established at Vienna, London, Paris and Naples, each in charge of one of the sons, the chief of the firm always residing at Frankfort. By a system of co-operation and joint counsels, aided by the skilful employment of subordinate agents, they obtained unexampled opportunities of acquiring an accurate knowledge of the condition of the financial market, and practically embraced the whole of Europe within their financial network. The unity of the interests of the several members of the firm has been preserved throughout the whole history of the business. The practice of the descendants of the five brothers. Each of the brothers received in 1815 from Austria the privilege of hereditary landowners, and in 1822 they were created barons by the same country. The charge of the Frankfort house devolved on the eldest, ANSELM MAYER (1773-1855), born on the 12th of June 1773, who was a member of the royal Prussian privy council of commerce, and, in 1820, Bavarian consuls and court banker. The Vienna branch was undertaken by SOLOMON (1774-1826), born on the 9th of December 1774, who entered into intimate relations with Prince Metternich, which contributed in no small degree to bring about the connexion of the firm with the allied powers. The third brother, NATHAN MAYER (1777-1836), born on the 16th of September 1777, has, however, generally been regarded as the financial genius of the family, and the chief originator of the transactions which have created for the house its unexampled position in the financial world. He went to Manchester about 1800 to act as a purchaser for his father of manufactured goods; but at the end of five years he removed to London. The boldness and skill of his financial transactions, which caused him at first to be regarded as unsafe by the leading banking firms and financial merchants, later awakened their admiration and envy. By the employment of carrier-pigeons and of fast-sailing boats of his own for the transmission of news he was able to utilize to the best advantage his special sources of information, while no one was a greater adept in the art of promoting the rise and fall of the stocks. The colossal influence of the house dates from an operation of his in 1810. In that year Wellington made some drafts which the English government could not meet; these were purchased by Rothschild at a liberal discount, and renewed to the government, which finally redeemed at par. From this time the allied powers negotiated loans to carry on the war against Napoleon chiefly through the house of Rothschild. Rothschild never lost faith in the ultimate overthrow of Napoleon, his all being virtually staked on the issue of the contest. He is said to have been present at the battle of Waterloo. Being able to transmit to London private information of the allied success several hours before it reached the public, he effected an immense profit by the purchase of stock, which had been depressed on the news of Blucher's defeat two days previously. Rothschild was the first to popularize foreign loans in Britain by fixing the rate in sterling money and making the dividends payable in London and not in foreign capitals. In 1815 he became the financial agent of nearly every civilized government, although persistently declining contracts for Spain or the American States. He did not confine himself to...
ROTHWELL—ROTIFERA

operations on a large scale, but on the contrary made it a principle to despise or neglect no feasible opportunity of transacting business, while at the same time his operations gradually extended to every quarter of the globe. He died on the 28th of July 1836, and was succeeded in the management of the London house by his son LIONEL (1808-1879), born on the 22nd of November 1808, whose name is associated with the removal of the civil disabilities of the Jews. He was elected a member for the City of London in 1847, and again in 1849 and 1852, but it was not till 1858 that the joint operation of an act of parliament and a resolution of the House of Commons, allowing the omission from the oath of the words to which as a Jew he conscientiously objected, rendered it possible for him to take his seat. He continued to represent the City of London till 1874. His eldest son, NATHAN (b. 1840), was created a peer as Baron Rothschild in 1885. JACOB (1792-1868), the youngest of the original brothers, was entrusted with the management of the business in Italy after the restoration of the Bourbons, for whom he negotiated large loans. At the Revolution of 1848 he was a heavy loser, and had also to be protected for a time by a special guard. It was by his capital that the earliest railways were constructed in France; the profits he obtained from the speculation were very large. He died on the 15th of November 1868. The Naples branch was superintended by another of the brothers, KARL (1780-1855). It was always the least important of the five, and after the annexation of Naples to Italy in 1860 it was discontinued.

ROTHWELL, an urban district in the Normanton parliamentary division of the West Riding of Yorkshire, England, 4 m. S.E. of Leeds. Pop. (1901) 11,702. The church of the Holy Trinity, though largely restored, retains some good Decorated details. Rothwell soon after the Conquest was granted as a dependency of the castle of Pontefract to the Lacy, who erected here a baronial residence of which there are slight remains. Coal and stone are obtained in the neighbourhood, and the town possesses match-works and rope and twine factories in which the majority of the large industrial population is employed.

ROTIFERA (or Rotatoria), a small, in many respects well-defined and somewhat isolated, class of the animal kingdom. Now familiarly known as "wheel animals," from the wheel-like motion produced by the rings of cilia which generally occur in the head region, the so-called rotatory organs, they were first discovered by A. Leeuwenhoek, to whom we also owe the discovery of Bacteria and ciliate Infusoria. Leeuwenhoek described Rotifer vulgaris in 1702, and he subsequently described Melicerta ringens and other species. A great variety of forms were described by other observers, but they were not separated as a class from the unicellular organisms (Protozoa) with which they usually occur, until the appearance of C. G. Ehrenberg's monograph, which contained a mass of detail regarding their structure. At the present day few groups of the animal kingdom are so well known to the microscopist, few groups present more interesting affinities to the morphologist, and few multicellular animals such a low physiological condition.

A rotifer may be regarded as typically a hemisphere or half an oblate spheroid or paraboloid with a mouth somewhere on the flat end ("disk" or "corona"), which bears a usually double ciliated ring, the outer zone the "cingulum," and inner the trochus; this ring serves both for progression (g) and for bringing up food. The body-wall, cuticulated outside, is formed by a single layer of ill-defined cells, and surrounds the simple body cavity (archiocoel), traversed by simple or branched muscular fibres ("mesenchyme") (fig. 1, m.m.). The mouth opens through a narrow pharynx (g) into a chamber which is (as in Crustacea) at once crop and gizzard, the mastax (ms), whose imbedded in the postero-ventral wall. A slender ciliated gullet (e) leads into a large stomach (st) whose wall consists of large richly ciliated cells with usually a pair of simple secretory sacs opening into it: it may open through an intestine or rectum into the cloaca. A pair of coiled nephridial tubes (n) formed of a file of perforated "drain-pipe" cells, with ciliated tag-like flame cells (f), open into a contractile bladder (bl), which passes by a slender duct into the cloaca. This also opens the genital duct from the single or paired gonad (ov). The simple nerve-ganglion or brain (g) lies on the anterodorsal side of the pharynx, and by its position determines the orientation of the animal, the cloacal opening lying on the same side, and the course of the gut being "neural." The sense organs are a pair of pigmented eyes (oc), and two pairs of antennae, one anterior proximal and near the wreath, the other dorsal and usually more or less lateral. The sexes are always separate, the males being of very rare occurrence in most cases. In the female the gonad is complex, consisting of a germarium for the formation of the eggs, and a vitellary, much more conspicuous and alone figured (ov), consisting of a definite number of large nucleated cells for the nourishment of the eggs. The apical end of the rotifer usually narrows suddenly beyond the curve of the gut and the cloacal aperture to form the foot of pseudopodium which ends in an organ of attachment, a pair of movable toes, each with the opening of a cement-gland (g) at its tip. Thus for orientation we place the rotifer like the cuttle-fish, head downwards: the ciliated disk is basal or oral, proximal to the rest of the animal, and the cloacal aperture is anterodorsal. It is in this position that free-swimming forms glide over the substratum of organic debris in which they find their food.

The cuticle may be locally or generally hardened, in the latter case being termed a lorica. Often the head is retractile, and a constriction of flexible cuticular distal to it is termed a neck; in Philodinaceae there are a series of thin flexible rings which permit both distal and proximal ends to be telescoped into the middle; and in Taphrocoma, regular constrictions of the whole bodywall give an appearance of metemeric segmentation to the body. In Philodinacea accessory toes are found, unfurnished with cement-glands and distinguished as spars.

Corona or Disk—This typically consists of two concentric zones, the trochus and cingulum, often separated by a groove or gutter which may be finely ciliated; but in several genera of no close affinity, where it is very oblique to the longitudinal axis of the body, it is represented by a general ciliation of the surface (Taphrocoma, Rattulina, Copesia, Adina). We may suppose that primi- tively the mouth was seated in the centre of a funnel-shaped disk, surrounded by a double wreath. The nearest approach to this is found in Microdon (fig. 2, 1) and its allies, the trochus being oval with two median gaps, the cingulum, more delicate, and complete. In Flosculariaceae the trochus is a horseshoe-shaped ridge
deep down in the funnel-shaped disk. The cingulum appears to be represented by the margin, usually produced into long petal-like deep lobes, from Fig. 2. Simple disk of Microodont; 2, bdeloid disk of Rotifer and of most Melicerata showing dorsal gap; 3, disk of Hydatina, with lobed ridges in the groove, bearing vibratile styles (membranelle); 4, disk of Melicerata ringens and M. conferta; the star represents the ciliated cup connected by ciliated depressions with the groove; 5, disk of Conochilus, like the Bdeloid, but with mouth antero-dorsal, the gap postero-ventral; 6, disk of Stephanoceros—cingulum broken up into setiferous lobes, groove a naked funnel, trochos a horse-shaped ridge, mouth central. lobes, fringed with long stiff setae, which in Stephanoceros are vibratile at intervals, seeming at will. In the the trochos they seem to convert the lobed funnel into an efficient casting net or mask net; in one species (F. pelagica) there is an outer gill of fine cilia for swimming. In Ab- sisus and Atrochus (fig. 3, b, d) the cingulum is a mere contractile hood. In most rotifers, as contrary, the trochos is stronger than the cingulum, often lobed, and with some of its cilia aggregated into vibratile styles homologous with the plates of Ctenophora (q.v.) and the membranelles of ciliate Infusoria (q.v.). The trochos forms the powerful currents for locomotion, and for the supply of food material, while the cingulum produces a local current round the upper rim of the crown to bring the food particles direct to the mouth, which is displaced through a postero-ventral gap in the trochos to lie behind the disk, just as occurs in the more specialized Ciliata. The current formed by the trochos is a gigantic vortex-ring, the deep stroke of the cilia being directly outwards, but the wave beats running around the organ in uniform succession in one direction. Thus the rotifer is, as it were, constantly drawn forward into the centre of this vortex ring. There is a dorsal interruption to the disk, involving both trochos and cingulum and groove. In this case the two halves of the disk may be developed in lobes, flower-shaped in Melicerata ringens, but often rounded and projecting like kettledrums. These give a strong impression of two crown wheels revolving in the same sense. This appearance puzzled the older observers, who were led thereby to give the name "wheel-bearers" to the group, until the true character of ciliary motion was recognized; for a wheel cannot be i organic continuity with the support on which it rotates. In a Melicertan, the mouth is placed towards the antero-dorsal side and the gap is postero-ventral.

In Melicerata ringens and M. conferta (fig. 2, 4; fig. 3, e, f) there is a glandular ciliated pit between the mouth and the chin into which the overflow water passes by a pair of gutters, and in which fine particles are aggregated into pellets, which are passed away as large deposits, as formed, on the edge of the tube and so builds it up a tube by pellets of its own faces (fig. 3, e). In most Pliona the dorsal gap is not strongly marked, and the trochos is broken up into a number of lobes, often furnished with vibratile styles, in front and on the sides, but ventrally passing into the uniformly ciliated oral funnel. Other ciliated organs to be noticed are the organs of the projecta of Bdeloidea, and the toes of Pedalion. Besides these Synchetaeida and Notom- catida consist a pair of auricles, great eversible ciliated pouches a little above the disk, utilized for swimming. The mouth begins as a funnel, continued, into a narrow sharynx, which in Flosculariaceae is prolonged into a slender tube hanging freely down the tube of the crop: this is followed by the crop-gizzard, also ciliated except where it is hardened into a set of articulated sclerites (trophi) to form the food supply of the animal. Thus the crop-gizzard has the same combination of structures as the stomach in the branchiopod Crustacea, with which we may call it homoplast. The trophi consist of a pipe or anvil or pin (fig. 4). Y-shaped, with the foot (culrum) distal dorsal gap (rami apical, often independently jointed; 2) with the outer ends of the rami articulate two lateral pieces (mallei), and again composed of a distal longitudinal piece (manubrium) and an apical transverse piece (the anvil), the whole resembling, as the name implies, a single-clawed hammer. For the varieties and modifications of the trophi we simply refer to Hudson's figure above. The relative size of the crop to the trophi varies greatly, but in general it is small where the trophi are well developed and complex, as well as in Bdeloidea; but in Flosculariaceae it is large, and so it is in Asplanchnacea. Eversible trophi of the forcipe or virgate type, which can be used for nibbling, are common in Pliona, notably Rattulidae, and are used for attachment to the host in the parasitic Sisomidae, &c. In Asplanchnacea also,
where the whole crop is strengthened by a framework of bars, the
incudate mastax lies in a little postero-ventral pouch which can be
erected through the crop and mouth. The stomach is generally
large; its wall consists of a layer of very large ciliated cells, which
often contain fat globules and yellowish-green or brown particles,
and outside these a connective tissue membrane; muscular fibrillae
have also been described. Very constantly a pair of simple sack-
like glands open into the stomach, and probably represent the
hepatic-pancreatic glands of other Invertebrates.

Following up the stomach there is a longer or shorter intestine,
which ends in the cloaca. The intestine is lined by ciliated cells.
In forms living in a tube the intestine turns round and runs forward,
the cloaca being placed so as to debouch over the margin of the
tube. The cloaca is often very large; the nephridia and oviducts
may open into it, and the eggs lodge there on their way outwards;
they are thrown out, as are the faecal masses, by an eversion of
the cloaca. Asplanchna, Notomma cespolis, and certain species
of Ascomorpha are devoid of intestine or anus, excremenous
matters being ejected through the mouth. The body cavity
(archicocle) contains a fluid in which very minute corpuscles have
been detected. There is no trace of a true vascular system. The
nephridia (fig. 1, B, b) present a very interesting stage of develop-
ment. They consist of a pair of tubules with an intracellular lumen
running up the sides of the body, at times merely sinuous, at others
considerably convoluted. From these are given off at irregular
intervals short lateral branches, each of which terminates in a
flame-cells (J) precisely similar in structure to the flame-cells found
in Planarians, Trematodes and Cestodes; here as there the question
whether they are open to the body cavity or not must probably be
answered by observation. The latter ends in a lumen of the cloaca,
orifices which communicate with the cloaca, or directly into the cloaca. They have the same functions
as the contractile vacuole of freshwater Protocoste (q.g.).

Nervous System.—There is a large ganglion lying in close contact
with the pharynx, proximal to the crop and on its antero-dorsal
side; in Bdelloidaeae at least it is united by short connectives
with a smaller postero-ventral ganglion to form a nerve collar.
From this simple nerve fibres are given off to the body-wall, especially
to the ciliated cells of the corona, to the foot, and also to the muscles
and sense organs.

The sense organs are eyes, antennae, sensory styles and a statocyst
in a few species. The eyes are refractive globules set in a cup of
red pigment traversed by a nerve fibre, and lie on the proximal
side of the body, directly on the postero-dorsal surface of the brain,
or at a little distance from it, on the neck, often within the circle
on the corona, and usually well within the transparent body. There
may be one, a pair, or rarely more, the outer ones being more or
less rudimentary. The antennae are short tubular extensions of
the body-wall, sometimes retractile with a depressed tip from which
protrudes a tuft of fine stiff bristles. They are possibly organs of
external taste (smell) as well as of touch. Typically there are two
pairs—a proximal, more or less approximated on the postero-dorsal
surface, and a distal pair, more widely separate. But the proximal
pair are often fused into a single median antenna (supplied, however,
you two nerves), and in one case at least the distal pair may be
similarly fused. Additional paired antennae may occur within
the coronal surface, which is the seat of the sensory styles, of less
complex structure, which occur in many genera. The statocyst
(retro-cerebral organ of P. Marius de Beauchamp) is a sac filled
with highly refractive granules soluble in dilute acids, and opening
by a slender duct (or a pair) to the surface: its function is doubtless
that of an organ of equilibrium, and it resembles in its opening to
the surface the primitive internal ear of even Vertebrates, for the
duct to the surface persists through life in the sharks.

Locomotor Organs.—Most free rotifers swim by the corona, aided
by the ciliated auricles when present. In Bdelloidaeae this may
alternate with a leech-like gait; the corona being withdrawn,
the cupped end of the proboscis serves as a sucker for attachment
alternately with the adherent foot, so that the animal loops its
way along. In two families mtilite articulated rods occur: in
Triarthridae they probably simply expand the dimensions of the
body in adaptation to life at the surface; or as a protection against
being swallowed by the smaller foes. In Polywirhra and Pteropsis
they are numerous, pinnated (feathered), and are doubtless used
for active swimming by jerks; they can be moved up or down by
special muscles attached to their bases, which project into the body.

![Fig. 5.—Pedalia mira. A, lateral surface view of an adult female: a, median ventral appendage; b, median dorsal appendage; c, distal ventro-lateral appendage; d, dorso-lateral appendage; e, dorsal antenna; f, "chin"; x' cephalotroch. B, lateral view of stem of vipecta. ac, eyene; m, nephridia; n, ciliated toes; other letters as above. C, ventral view: x' trochus; x' cingulum; other letters as above. D, ventral view, showing the musculature (cf. text). E, dorsal view of a male: a, lateral appendage; b, dorsal appendage. F, lateral view of a male. G, enlarged view of the antenna. H, lateral view of the median ventral appendage. (All after Hudson.)](https://example.com/fig5)

In Pedalia (fig. 5), a remarkable form discovered by Dr C. J.
Hudson in 1871 and found in numbers several times since, these
appendages have acquired a new and quite special development. They are six in number, median, ventral and dorsal, and two unequal lateral pairs. The largest is placed ventrally at some distance distal to the mouth. Its free extremity is a plume-like expansion (fig. 5, Aa and 11). It is, in common with other similar appendages, a hollow process into which run two pairs of broad, coarsely transversely striated muscles. Each pair has a single insertion on the inner wall—the one pair near the free extremity of the limb, the other near its attachment; the bands run, one on each side, and run right round the body forming an incomplete muscular girdle, the ends approximating in the median line. Above this point springs the large median dorsal limb, which terminates in groups of long setae. It presents a single pair of muscles attached along its inner wall which run up and form the girdle in the body posterior third. On either side is attached a dorso-lateral and ventro-lateral appendage, each with a fan-like plume termination consisting of compound hairs or setae, found elsewhere only among arthropods (q.v.). Each of these is running upwards toward the neck and arising immediately under the trochal disk, the inferior ventro-lateral pair also presenting muscles which form a girdle in the hind region of the body. It bears a group of long setose hairs the bases of which are connected with the nerve fibre. There are also two pairs of distal antennae. 

**Peda1lon** presents a pair of ciliated toes in the posterior region of the body (fig. 5, B, C, and D, e), which it can apparently use as a means of attachment; Dr. Hudson states that he has seen it anchored by these and swimming round and round in a circle.

**Reproduction Organs.**—Rotifers are unisexual, with the sexes dimorphic. The ovary is, as in many Phylum helminthes, duplex; one part, the germarium, begins an oogenetic process by cell multiplication of the germ-cells or eggs proper, the other, the vitellaria, being responsible for the production of the vitelline, a conspicuous and usually consisting of a definite number of large ciliated eggs. In Asplanchnaceae, Philodinae and Echinochelae. In these phyla the vitellaria of the transverse horse-shoe-shaped vitelline. In Bdelloidae and Isotrichae the vitellaria of the whole organism is placed in the germinal proximal, the vitellaria next the cloaca. As a rule, the egg-stage is a single cell, and is continued into a uterine tube opening into the cloaca; in Isotrichae this is absent, and the young are free in the body cavity and escape by piercing the wall. We have here only the details of development and of the structure of the cloaca and its identification of "trophus" and "cloaca," with the presence of the wreaths of the trophophore larva. We homologize the rotifer with the Turbellarian larva (fig. 8, A), and with the proral or upper part of the trophophore (fig. 8, E, F). Its adhesive foot is paralleled by a cup-shaped ciliated depression, possibly nervous, found in all the larval forms, except in some Echinoderms, and in Crinoids and Crinoidea actually serves as an organ of attachment. This view obviates the need for assuming the complicated flexures of the wreath which has to be done on other assumptions (see Röttgera, Albersch, Macmillan, fig. 8, D), which has not to be considered. The female of the same type as Melicerina, &c.) is an extremely modified type, and its resemblance to the trophophore larva of *Lepo- 

From Cambridge Natural History, vol. II, "Worms, &c.; by permission of Macmillan & Co. Ltd.

**Fig. 8.**—Diagram of morphological relations of Rotifer. A, *pildium* larva of *Notomine*: B, *Asplanchnus* schematized; C, a plomial rotifer; D, trochosphaeria female (schematized from Semper); E, veliger larva of mollusk; F, trophophore larva of *Philodina*; G, ovary; A, anus; **ap**, apical organ, corresponding to foot of rotifer; **at**, median antennae, united by a nerve to *br*, brain (letter omitted in B); **bl**, bladder, receiving ramified kidney in B, C, D; **f**, foot; **g**, cement-gland; **ovary**, **kidney**; **m**, mouth; **n**, supra-oesophageal ganglion; **nr**, nerve ring in section.
gastrovascular cavity of the Rotifers is a primitive archetypal; the persistent or accentuated cleft between epiblast and hypoblast, traversed by mesenchymal muscular bands. Thus we regard Rotifers as an independent stem branching off at the outset of the rise from the Platode type to higher Invertebrata. The Polyzoa (q.v.), which in many ways recall Rotifers, appear to be equally independent.

The following classification of Rotifers is our modification of that of Hudson and Gosse, further altered through considerations put forth in American Naturalist, vol. xxxv., by permission of Ginn & Co.

Fig. 9—a, Microcodon clavis, showing corona, lateral antennae and joined foot; b, Rhinops virens, corona from below, showing proboscis; c, Philodina megalotrocha; d, head of Rotifer macrocorus, postero-ventral view, showing lobes of corona, and antero-dorsal median antenna, telescopic with setae; e, Rotifer (Actinurus) neptunius, showing head with retracted corona, and protruded dorsal proboscis bearing median antenna, and telescopic foot with toes and spines; f, Asplanchnopsis myrmecoleus, showing horseshoe-shaped geranium (left), blind saccate stomach (right), apical bladder, foot, &c.; g, Asplanchna ebiobronn—a tied the tube at left is a kidney; h, i, incutent jaws of Asplanchna brightwelli and sperm, chiefly formed of rami, with the rudimentary mallei parallel and external to them; j, Ascomorpha hyalina.

Forward by C. Weisenburg-Lund, which, however, we do not consider wholly convincing. He notably regards an oblique disk with uniform ciliation as primitive, a view which we cannot adopt.

Classification:

(A.) Disk usually with well-marked strong troches, ciliated groove and more delicate cingula interrupted by an antero-dorsal median gap, usually more or less bilobed.

(i.) Trophi inductae:

1. Asplanchnaceae; troches circular; foot absent or minute; trophi incutent; stomach blind; males frequent, not very dissimilar to females. Asplanchna (fig. 6, g-i); Asplanchnopsis Deguerne (fig. 9, f); Ascomorpha Perry (fig. 9, j).

(ii.) Trophi malleoramal:

2. Melicertaceae; females tubicolous, usually attached, or forming spherical floating social aggregates; males free swimming. Melicerta Schrank (fig. 3, f); Oecistes Ehrenberg; Lactinularia Schweigger; Conochlites Ehrenberg, with gap postero-ventral and mouth antero-dorsal (fig. 2, 3).

3. Trochosphaeraceae; female footless; subcircular, the corona bulging into a hemisphere which may equal the hemispherical body; anus apical; male as in Melicerta. Trochosphaerum Semper (fig. 8, D).

4. Ploimodidaeae; subconical; corona bilobed; retractile foot absent or ciliated; notole appendages present in two families.

(a) Pterodinidae; foot a ciliated cup; cuticle formed flaps. Pterodina Ehr. (fig. 7, d).

(b) Triarthridae; body with a pair of long cervical spines pointing distally and serving for leaping movements or to extend the body and make it too big for small enemies to swallow; Pedetes Gosse (no median spine); Triarthra Ehr., one postero-ventral spine; Tetramastix Zacharias, two unequal median spines.

(c) Pedalioidae, foot represented by two styles, sometimes ciliated; body provided with six hollow-jointed muscular fins for swimming and leaping. Pedalio Hudson (fig. 5).

(iii.) Trophi ranate:

5. Bdelloidaeae; foot with two toes and accessory spurs on a simple perforated disk; body telescopic at either end with an antero-dorsal proboscis ending in a ciliate cup and bearing the proximal antenna; corona usually bilobed. Males if present probably like the females. German and oval paired; ovoid absent; young viviparous. Rotifer Schrank (fig. 9, d, e); Philodina Ehr. (fig. 9, c); Callidina Ehr. (eyeless); Adina Hudson (eyeless with the corona uniformly ciliated, and proboscis adnate, hooked.

(iv.) Trophi uncinate:

Flosculariidae: disk a contractile cup, often lobed, the cingulum of long vibratile cilia, of very long motionless bristles or absent, rarely with an outer zone of fine cilia. Trochus a pair of ridges or horsehoe open in front. Oral funnel produced into a fine tube hanging freely into a pharyngal cup, containing the uncinate trophi. Body-wall usually traversed by a network of canals serving by their contraction to expand the disk. Males and larvae with a ciliated pedate cup and a simple ciliated disk.

(a) Flosculariidae; tubicolous, with a lobed disk, bearing stiff or vibratile setae. Floscularia Oken (fig. 3, b); Stephanoecera Ehr. (fig. 3, a).

(b) Acyclidae. Disk entire or tentacular, not ciliated. Acyculus Leitz (fig. 3, 2). Foot presented by a button-like disk, carried far from the posterior surface; Apisus Metchnikoff (fig. 3, d); Atrochus Wierzezksi (fig. 3, c).

(B) Ploimidaeae; disk variable, often circular, sometimes with a lobed troches bearing membranellas (vibratile styles); trophi complete, malleate, submalleate, virgate, or foricrate; anus subapical; foot usually short, and usually bearing two toes which may be much elongated.

Illicicata, cuticle soft; ciliated exsertile auricles above the disk sometimes present. Albertia Dujardin; Diplotaxus Vejdovsky; Microdorina Ehr. (fig. 6, 2); Enchidina Ehr. (fig. 9, 2); Sychonopora Ehr. (fig. 7, c); Hyalina Ehr. has no eye; Notomnata Ehr. (restricted by Gosse); Copias Gosse; Notopoda Hudson (fig. 6, 3); Prodes Gosse; Gastrochidz; Diplena Ehr. (fig. 6, 4); Lophoecosa Ehr. (fig. 6, 3); Lophonoma Ehr. (fig. 6, 2); Taphrocampus Gosse.

(C.) Seismonaenae. Body elongated with a narrow neck above the disk; foot terminal perforated disk. Trophi virgate exsertile; germen paired; genito-urinary cloaca opening above the neck in the male, subapically in the female. Gut blind (Paraseison), or opening into cloaca (Seison). Males resembling females, conical, sometimes with a ciliated gut opening on the ventral surface of the crustacean Nebalia; Seison Claus; Paraseison Plate.

Habitat and Habits.—The Rotifera are all aquatic, the majority dwelling in fresh water with Protozoa and Protophyta, as well as Entomostracous Crustacea. This association with Protophyta accounts for their study by many distinguished botanists, such as W. C. Williamson and F. Cohn. Some are moss-dwellers, inhabiting the surface film of water that bathes these plants: such especially are the Bdelloids, with their exceptional capacity for resisting desiccation. Others—the majority—live among weeds, the tubicolous ones mostly upon them. A few are saprophages, haunting the looser debris that forms the uppermost layer of the bottom ooze of quiet waters: we may cite the aberrant Floscularia Atrochus. Widely different are the habits of the plankton forms, which float or swim near the surface, and are often provided with long
cuticular extensions for this purpose (fig. 7, a, b). Asplanchna,
plankton, dwellers in small pools, are, however, oviparous, and
*Trachelotheca* is spherical and must owe its floating powers to
the low density of the liquid in its enormously dilated body-cavity.
Laciniularia racemosa and Conochilus form free-floating
aggregates, the eggs, as laid, hatching and the young
settling among the approximated gelatinous tubes of the parents.
Some species only frequent the clearest waters; but the lovely
transparent *Hyalina senta* (fig. 2, 3) likes water contaminated
by the visits of cattle or the drainings of manure. *Drilophus*
and *Albella* are parasitic on the surface or within the
gut of Naid Oligochaetes worms: *Seisonacea* are ectoparasitic
on the Crustacea *Nebalia*, *Proxas wormecki* forms galls within
the Converva *Vaschera*, and *P. parasita* invades the central
jelly of the Phytolagellate *Volvox; P. petromyzon* is a frequent
commensal in the gill cavity of some Cladoceran Crustacean
*Eucythereus lamacerus*.

The geographical distribution is cosmopolitan, as is the case
with Protozoa and Protophyta of this form. A curious
fact is that when a new and striking form is found first in one
place it is shortly after collected from widely separated areas.
In the case of one genus, *Gastrochaena*, this led to the creation
of no less than six generic names.

**History and Bibliography.**—As rotifers are common in ponds,
the first workers with the microscope observed them repeatedly, the first
work being that of John Harris in 1696, who found a Bdelloid in a
galley and described it in *Phil. Trans.* He also described some tubiculous species and during the 18th century a
fair number of species were observed, figured and described with
names. During this time the illusion of a wheel or wheels produced
by the action of the disk puzzled all observers. C. T. Ehrenberg included the Rotifers in his *Infusoria*, and described
and figured with fair precision many of the genera and species.
Dujardin gave a less detailed but more accurate account under the
name of *Ctenophora* in 1825. The next full work was a valuable
compilation by W. C. Williamson (best known as a botanist) in
Pritchard's *Infusoria*, 1861. Much work was done with the
gradual introduction of improved methods during the last forty
years. Indeed, the first really successful classification was
practically made, however, at the close of the fifties. P. H. Gosse
collected and described many species, and elucidated the structure of the
mastrax in 1856. Zoologists of the standing of Huxley, Claus and
Leydig added to our knowledge of the anatomy and to the theory
of their relations. But the monumental monograph of C. T. Hudson and Gosse containing a new classification, an illustrated
description of all the then known species and much information on
the structure of the animals is perhaps still the most complete treatment on
the subject.

C. Zelinka has given us the most detailed anatomical accounts we
possess for several Bdelloidaceae, and was the first to utilize modern
methods of microscopic technique on a complete scale.

F. C. Dressel, *Die Infusorienschicht als vollkommenere Organis-
men* (1848); F. Dujardin, *Histoire naturelle des zoophytes* (1841);
P. H. Gosse, *Monetary Organism in Class Rotiferia*, *PhiL. Trans.*
(1856); W. C. Williamson, *Ctenophora* in *Pritchard's Infusoria* (1861).

**ROTORUA,** a town of Rotorua county, North Island, New
Zealand. It lies in the midst of a remarkable volcanic district
generally known as the Hot Rotorua district, or fancifully as the
Wonderland, which covers an area of 660 sq. m. and extends
160 m. from N.E. to S.W. from White Island, an active volcanic
cone in the Bay of Plenty to the mountains of Tongariro,
Ngaruhoe and Ruapehu in the interior of the island, S.W. of
lake Taupo. Rotorua attracts many visitors on account of the
beauty and scientific interest of the locality and the bathing
in its various medicinal springs. It is a scattered town-
ship lying on the south-western shore of lake Rotorua, amid
hills reaching 2600 ft. in the immediate neighbourhood, and
much of the volcanic soil supports a rich growth of forest or
"bush."

The springs are principally alkaline, alkaline and siliceous, acidic,
or acidic and hepatic (sulphurous). The township includes
the Maori village of Ohinemutu, an interesting collection of
dwelling places, whose inmates constantly use the numerous rudely
cutaneous basins which are fed by springs varying in temperature
from 60° F. to the boiling-point, and are in some cases used for
cooking. In the vicinity, on the lake-shore, is the government sanatorium.
Two miles south of Rotorua is another native village, Whakarewarewa, where there are grey and blue springs.
Four miles from Rotorua, near the centre of the lake, the island of
Mokoia rises to 1518 ft. It is partly under grass and partly
wooded, and is inhabited by Maoris, by whom it is regarded as holy
and a place of propitiation. A figure was formed extending nearly
9 m. along the axis of the disturbance, and the mission station of
Wairoa (8 m. from Rotorua) on the western shore of the lake was
overwhelmed. A line of craters is seen to the south-west. The
waters of Rotorua are a

**RÔTROU, JEAN DE (1609-1650), French tragic poet, was born on the 15th or 20th of August 1609, at Dreux in Normandy.
Rotorua studied at Dreux and at Paris, and, though three years younger than Corneille, began play-writing before him. In
1631 he became pensioner to the Roi at the Hôtel de Bourgogne.
With few exceptions, the only events recorded of his life are the successive appearances of his plays and his
enrolment in 1635 in the band of five poets who had the duty of turning Richelieu's dramatic ideas into shape. Rotorou's
first piece, *L'Hypochondriaque* (pr. 1631), dedicated to the Comte de Soissons, seigneur of Dreux, appeared when he
was only eighteen. In the same year he published a collection of *œuvres poétiques*, including elegies, epistles and religious verse.
His second piece, *La Baguée de l'oubli* (pr. 1635), an adaptation in part from the *Sortijas del Obvio* of Lope de Vega, was much
more characteristic. It is the first of several plays in which Rotorou endeavoured to naturalize in France the romantic
comedy which had flourished in Spain and England instead of the
classical tragedy of Seneca and the pastoral comedy of
Terence. Corneille had jottedings in the same direction. Rotorou's
brilliant but hasty and unequal work showed throughout marks of
a stronger adhesion to the Spanish model. In 1634, when he printed *Cléopâtre* et *Doristâle* (acted 1630), he said he was already
the author of thirty pieces; but this applies no doubt to adapta-
tions. Diane (acted 1630; pr. 1633), *Les Occasions perdus* (acted 1631; pr. 1635), which won for him the favour of Richelieu,
and *L'Heureuse Constance* (acted 1631; pr. 1635), which was praised by Anne of Austria, succeeded each other rapidly,
and were all in the Spanish manner. In 1631 Rotorou imitated Plautus in *Les Menchimes* (pr. 1636), and in 1634 Seneca in
his *Hercule mourant* (pr. 1636). Comedies and tragi-comedies
followed. Documents exist showing the sale of four pieces to
Antoine de Sommarielle for 750 livres tournois in 1636, and in
the same year to the same bookseller. He spent much time at
Le Mans with his patron, M. de Belin, with whom he was one of the
opponents of Corneille in the quarrel of the Cid. It has been
generally assumed, partly because of a forged letter long accepted
as Corneille's, that Rotorou was his generous defender in this
matter. He appears to have been no more than neutral, but is
credited with an attempt at reconciliation between the parties
in a pamphlet printed in 1637, *L'Encogné et véritable amy de
messeurs de Scudéry et Corneille*. M. de Belin died in 1637,
In 1639 Rotrou bought the post of lieutenant particulier au bailliage at Dreux. In the next year he married Marguerite Camus, and settled down as a model magistrate and juge de famille. Among his pieces written before his marriage was a translation of the Amphiyron of Plautus, under the title of Les Deux Soisies (1636), Antigone (1638), and Laure Persuccée (acted 1637; pr. 1639), in the opposite style to these classical pieces. In 1646 Rotrou produced the first of his masterpieces, Le Vertueux Saint Genest (acted 1646; pr. 1648), a story of Christian martyrdom containing some amusing by-play, one noble speech and a good deal of dignified action. Rotrou uses with considerable success the device of a play within a play. The actor Genest becomes a real convert while playing the part of a Christian martyr. Incidentally (Act i. Sc. v.) Rotrou pays a noble tribute to the genius of Corneille. Don Bertrand de Cabrère (1647) is a tragi-comedy of merit; Venceslas (1647; pr. 1648) is considered in France his masterpiece, and has had several modern revivals; Cosrœs (1649) has an Oriental setting, and is claimed as the only absolutely original piece of Rotrou. These masterpieces follow foreign models, and Rotrou's genius is shown in the skill with which he simplifies the plot and strengthens the situations. Saint Genest followed Lope de Vega's Lo funesto verdadero; Venceslas followed Racine's Memoires d'un digne. In this play Ladasis and his brother both love the princess Cassandra; Ladasis makes his way into her house and in the darkness kills a man whom he thinks is to be the duke of Courland, but who is really his brother Alexandre, the favoured lover. In the early morning he meets the king and is confronted by the duke of Courland. The outline of this incident is in the Spanish play, but there the spectators are aware of the ghastly mistake at the time of the murder. Rotrou shows his dramatic skill by concealing the real facts from the audience until they are revealed to the horror-struck Ladasis himself.

In 1650 the plague broke out at Dreux. Rotrou remained at his post, although urgently desired to save himself by going to Paris; caught the disease, and died in a few hours. He was buried at Dreux on the 28th of June 1650. Rotrou's great fertility (he left thirty-five collected plays besides others lost, strayed or uncollected), and perhaps the uncertainty of dramatic plan shown by his hesitation almost to the last between the classical and the romantic style have injured his work. He has no thoroughly good play, hardly one thoroughly good act. But his situations are often pathetic and noble, and as a tragic poet properly so called he is at his best in the plays of Corneille and of Racine. His single lines and single phrases have a brilliancy and force not to be found in French drama between Corneille and Hugo.

A complete edition of Rotrou was edited in five volumes by Viollet le Duc in 1822. In 1882 M. de Ronchaud published a handsome edition of six plays—Saint Genest, Venceslas, Don Bertrand de Cabrère, Antigone, Hercule Mourant and Cosrœs. Venceslas and Saint Genest are also to be found in the Chefs-d'oeuvre Tragiques of the Collection Didot.

Rotrou's brother, Pierre Rotrou de Saudreville, left a memoir of him which is unfortunately lost, but this is cited by the Abbé Brillon (1771-1736) as his authority in a Notice biographique sur Jean Rotrou, first printed in 1885 at Chartres under the editorship of L. E. Castel to show that Rotrou was not the Venceslas of 1647, but a pseudo Rotrou to answer the need of the day of a work "pour servir à l'histoire des hommes illustres" (1731), vol. xxvi. pp. 89-97; and the duc de la Vallière, Bibliothèque François depuis son origine (Dresden, 1708), vol. ii. pp. 155-273. Modern works are by J. Lamy, Essai sur les œuvres dramatiques de Jean Rotrou (Paris and Lille, 1868); Léonce Person, Histoire du Venceslas de Rotrou, suivie de notes critiques et biographiques (1882), in which many legends about Rotrou are discarded; Histoire du véritable Saint Genest (Dusseldorf, 1760); Les Papiers de la Bibliothèque de la Ville de Chartres (1853); Henri Chardon, La Vie de Rotrou mieux connue (1884); and Georg Steffen, Jean de Rotrou als Nachahmer Lope de Vega's (Berlin, 1881).
town with the suburb of Eihein, 7 m. by rail S.W. of Tübingen. Pop. (1905) 75,554. It is the seat of a Roman Catholic bishop, and possesses the fine Gothic cathedral of St Martin; several other churches; an old castle now used as a prison; and a building, formerly a Jesuit monastery and now the residence of the bishop. The chief industries are the manufacture of machinery, screws, watches and beer, tanning and the cultivation of fruit and hops. Rotterdam passed into the possession of Austria in 1281 and into that of Württemberg in 1805. Near the town are the remains of the Roman station of Sumalocenna or Salmuncinae.

**ROTTERDAM**, a city of Holland in the province of South Holland, on both banks of the New Maas, at the confluence of the canalized Rotte, and a junction station 143 m. by rail S.S.E. of the Hague. Steam tramways connect it with Schiedam, and with Numansdorp on the south of the island of Beiderland, and there is a regular service of steamers by river and canal to Antwerp by way of the South Holland and Zeeland Islands and in every direction. The population of the city was about 20,000 in 1632; 53,112 in 1796; 105,838 in 1860; and 379,017 in 1905. Its shipping facilities have raised Rotterdam to the position of the first commercial city of Holland. By means of the New Waterway (1869–90) to the Hook of Holland it is accessible for the largest ships. The principal quay is the Boompjes ("little trees"), forming the riverfront on the north side. Although originally situated exclusively on the north or right bank of the Maas, in 1890 Rotterdam was extended to the southern shore by the acquisition of the commune of Feinenoord; while in 1886 Delfshaven on the west, and in 1895 Charlois on the south-west and Kralingen on the east, were also incorporated. The river is spanned by a road bridge (1878) and a railway bridge (1877) passing from the Boompjes to the North Island, whence they are continued to the farther shore by swing-bridges through which the largest ships can pass to the upper river. These bridges proved useful in breaking up the ice which forms above them in winter. On the south side of the river are numerous large docks and wharves, while the city proper on the north side consists of a labyrinth of basins and canals with tree-bordered quays.

In the centre of the town is the Beursplein, or Exchange Square, with the large general post office (1873), the "Amicitia" club, and the exchange itself (1723). Before the exchange is the great market-place, built on vaulting over a canal, and containing a bronze statue of Erasmus, who was born in Rotterdam in 1469. The statue is the work of Hendrik de Keyser, and was erected in 1622 (the inscription being added in 1677) to replace an older one. Beyond the market-place is the High Street, which runs along the top of the Maas Dyke. On the west of the city a pretty road planted with trees and grass plots leads from the Zoological Gardens (1857), on the north to the small park overlooking the river. In the park is a statue of the popular poet Hendrik Tollens (d. 1836), a native of the city. Among the churches of Rotterdam are an English church, originally built by the 1st duke of Marlborough, whose arms may be seen with the royal arms over the entrance. The Grote Kerk, or Laurens Kerk (end of the 15th century), contains a fine brass screen (1715), a celebrated organ with nearly 3000 pipes, and the monuments of Admirals Witte de Witte (d. 1658), Cortenaer (d. 1669), and van Brakel (d. 1690), and other Dutch naval heroes. The lofty tower commands an extensive view. In the New Market adjoining is a fountain adorned with sculptures erected in 1874 to commemorate the jubilee of the restoration of Dutch independence (1813). The museums of the city comprise an ethnographical museum, the maritime museum established by the Yacht Club in 1874, and the Boyman's Museum (1867), containing pictures, drawings and engravings, as well as the town library. Of the original collection of pictures bequeathed by F. J. O. Boyman in 1847, more than half was destroyed by fire in 1864, but the collection has been enlarged since and is representative of both ancient and modern artists. Close to the museum is a statue of the statesman Gysbert Karel van Hogendorp (1762–1834), a native of the city. Among the remaining buildings must be mentioned the town hall (17th century; restored 1823), the court-house, the concert-hall of the "Harmonic" club, the record office (1900), the lessoodwiet, or subscription library and reading-rooms, and the ten-storied Witte Huis (1807), which is used for offices and is one of the highest private buildings on the Continent.

The industries comprise the manufacture of tobacco, cigars, margarine, rope, leather, &c., and there are breweries, distilleries and sugar refineries. The gas, electricity (1864) and waterworks (1870) are under municipal control. Shipbuilding yards extend above and below the city, one of the earliest being that of the Netherlands Steamboat Company (1825). It is, however, as a commercial rather than as a manufacturing city that Rotterdam is distinguished, its progress in this respect having been very striking. Between 1855 and 1902 the area of canals and docks in use on both sides of the river increased from 90 to over 300 acres, about £1,285,000 having been spent on the building of docks in the last quarter of the 17th century. Besides its maritime trade Rotterdam has an extensive river traffic, not only with Holland, but also with Belgium and Germany. Its overseas trade is principally with the Dutch colonies, New York, La Plata and the east and west coasts of Africa. The great harbour works on the south side of the river required to accommodate this growing trade were planned by the engineer Stieltjes (d. 1878), who has a monument on the North Island. Besides being easily accessible from the river and connected with the railways, the docks are provided with every facility for cooling and loading or discharging cargoes. The larger passenger steamers of the Rotterdamische Lloyd to Netherlands India and of the Holland-American Steamship Company (the two principal passenger and cargo steamship companies at Rotterdam) have their berths on the south side of the river. In the centre of the river there is accommodation for over thirty vessels at the mooring buoys. The increase in the importance of Rotterdam as a port, apart from the development of the trade of the Netherlands generally, is shown by the fact that whereas in 1846 only 31% of the total trade of the country passed through the port, in 1883 the proportion was 50%; in the same year 43.75% of the total number of vessels engaged in Dutch trade used the port of Rotterdam, whereas in 1850 the proportion was only 35.77%. The average number of all vessels using the port annually during the decade 1897–1906 was 72,288 of 11,163,624 tons, but a steady increase was recorded during this period, from 62,212 ships of 8,434,632 tons in 1897 to 87,658 ships of 14,572,216 tons in 1906.

Rotterdam probably owes its existence to two castles, which existed in feudal times. In 1390 John I., count of Holland, granted to the people of Rotterdam the same rights as were enjoyed by the burghers of Beverwijk, which were identical with those of Haarlem (K. H. Hegel, *Städte und Gilden*, 1891, Bd. ii.). This privilege marks the origin of the town. In 1489 it was surprised by Francis van Briderode, and in 1572 it was plundered by the Spaniards, who were in possession for four months. It continued to increase in size, various extensions of its boundaries being made, and its trading importance is to a large extent the result of its commercial intercourse with England.

**ROTTWEIL**, a town of Germany, in the kingdom of Württemberg, lying on a hill on the left bank of the Neckar, 46 m. S.W. of Tübingen by rail. Pop. (1903) 9068. It is partly surrounded by walls, and contains two fine churches, the Gothic Heilige-Krönungskirche, built in the 14th century and restored in 1849, and the Capellen-Kirche with a Gothic spire 230 ft. high. It has a medieval town hall, several schools and a museum of antiquities. Especially noteworthy is the collection of sculptures and pictures of old German art in the chapel of St Lawrence, where there is also a Roman mosaic, found in the vicinity, portraying Orpheus in the centre and, at the sides, Roman chariot-races and gladiators. The industries of the place
embrace the manufacture of powder, locomotives, machinery, cotton, leather and beer. There is also a considerable trade in live stock, agricultural produce and wine.

Roubaix is also wood manufacture, but cotton, silk and other materials are also produced. The chief of these are fancy and figured stuffs for garments, velvet and upholstery fabrics. Wool-combing and wool-dressing works, spinning-mills, weaving establishments, dye-houses and printing-works occupy some 50,000 work-people, and four hundred firms act as commission agents for the sale of raw material and the other requisites for the industry. Power is supplied chiefly by steam, less than 5000 out of 28,000 looms being hand-looms. There are breweries, rubber-works, metal foundries and machinery-works in the town. Tomato and grape growing under glass for the winter market is extensively prosecuted. To maintain the high standard of artistic taste which has made the industry of Roubaix a success, schools have been multiplied. By the co-operation of the town and the state the national school of industrial arts was founded in 1883. This is a small university of art, commerce and industry, the twenty-two courses of which include all the branches of knowledge useful in any of those pursuits. Among the public institutions are the tribunal of commerce and the chamber of commerce, the exchange, a board of trade-arbitration and the establishment (bureau de conditionnement) for determining the nature and weight of silk, wool and cotton.

The prosperity of Roubaix had its origin in the first factory franchise granted in 1469 by Charles the Bold, duke of Burgundy, to Peter, lord of Roubaix, a descendant of the royal house of Brittany. In the 18th century Roubaix suffered from the jealousy of Lille of which it was a dependency, and it was not till the 19th century that its industries acquired real importance. The population, which in 1804 was only 87,000, had risen in 1861 to 40,000, in 1866 to 65,000, and in 1875 to 83,000.

**ROUBILAC (more correctly ROUBILLAC), LOUIS FRANÇOIS (1605-1762), French sculptor, was born at Lyons and became a pupil of Balthasar of Dresden and of N. Coustou. It is generally stated that he settled in London about 1720, but as he took the second grand prize for sculpture in 1739, while still a pupil of Coustou, it is unlikely that he visited England earlier than 1744. The account given by Dussieux, is incorrect. He was at once patronised by Walpole and soon became the most popular sculptor in England, superseding the success of the Fleming Rysbrack and even of Scheemakers. He died on the 11th of January 1762, and was buried in the church of St Martin-in-the-Fields. Roubillac was largely employed for portrait statues and busts, and especially for sepulchral monuments. His chief works in Westminster Abbey are the monuments of Handel, Admiral Warren, Marshal Wade, Mrs Nightingale and the duke of Argyll, the last of these being the first work which established Roubillac's fame as a sculptor. The statues of George I., Sir Isaac Newton, and the duke of Somerset at Cambridge, and of George II. erected in Golden Square, London, were also his work. Trinity College, Cambridge, possesses a series of busts of distinguished members of the college by him. Roubillac possessed skill in portraiture and was technically a master, but lived at a time when his art had sunk to a low ebb. His figures are frequently uneasy, devoid of dignity and sculptural breadth, and his drapery treated in a manner suited to painting than sculpture. There are, however, noteworthy exceptions, his bust of Pope, for example, reaching a high standard. More often, however, his striking effect detracts from the repose of attitude.

His most celebrated work, the Nightingale monument, in Westminster Abbey, a marvel of technical skill, is saved from being ludicrous by its gallery and the effective use of blank space. On this the dying wife is represented as sitting in the arms of her husband, who in vain strives to ward off a dart which Death is aiming at her. The lower part of the monument, on which the two portrait figures stand, is shaped like a tomb, out of the opening door of which Death, as a half-seen skeleton, is bursting forth. The celebrated bust of Shakespeare, known as the Davenant bust, in the possession of the Club of Fine Arts in London, the statue of Shakespeare, a commission from David Garrick, and bequeathed by the actor to the English nation, is in the British Museum, and shows the talent of the sculptor in a flattering light. This bust is recorded in France, the land of his birth and education.

**ROUCHER, JEAN ANTOINE (1745-1794), French poet, the son of a tailor of Montpellier, was born on the 22nd of February 1745. By an epiphany on Louis XVI. and Marie Antoinette he gained the favour of Turgot, and obtained
a salt-tax collectiosity. His poem was entitled Les Mois; it appeared in 1779, was praised in MS., damned in print and restored to a just appreciation by the students of literature of the 19th century. It has the drawbacks of merely didactic-descriptive poetry on the great scale, but occasionally displays much grace and spirit. The malicious wit of Rivarol’s will on the last pages of the poem, “C’est le plus beau naufrage du siècle,” is not intelligible unless it is said that one of the most elaborate passages describes a shipwreck. Roucher was a disciple of Voltaire, and therefore a friend of the Revolution, but he remained moderate in his opinions. He frequently presided over an anti-Jacobin club, and denounced the tyranny of the popular demagogues in supplements published with the Journal de Paris in 1792. He was arrested on the 4th of October 1793, and, accused of being the leader of a conspiracy among the prisoners at Saint Lazare, was sent to the guillotine on the same tumbrel with his friend André Chénier on the 25th of July 1794. Roucher translated in 1790 Adam Smith’s Wealth of Nations. His letters from prison were edited by his son-in-law under the title of Consolations de ma captivité (1797), and his death was made the subject of a tragedy in 1834 by his brother Claude Roucher-Deratte, a voluminous writer.

Roux, Guillaume François (1703-1770), French chemist, was born in 1703 at Mathieu, near Caen. He started as an apothecary, but in 1742 he was appointed experimental demonstrator of chemistry at the Jardin du Roi in Paris, where he was especially influential and popular as a teacher, numbering Lavoisier and J. L. Proust among his pupils. Many stories are told of the vivacity and enthusiasm with which he lectured, of the absent-mindedness which sometimes led him, forgetting that his pupils could not hear what he was saying, to continue his explanations while he was out of the classroom looking for some piece of apparatus, and of the vigorous tirades, generally culminating in the epithet “plagiare,” in which he used to indulge against men with whom he disagreed (Houter, Histoire de la chimie, ii. 378). His most important achievement was to define “salts” — a term formerly used in the most loose and indeterminate way—as the compounds formed by the union of acids and bases, and further to distinguish between neutral, basic and acid salts. Other subjects on which he published papers were the inflammation of turpentine and other essential oils by nitric acid, and the methods of embalmment practised by the Egyptians. He died at Passy on the 3rd of August 1770. He is known as Rouelle the elder, to distinguish him from his younger brother and assistant, Hilaire Marin (1718-1779), who, on his resignation in 1768, succeeded him as demonstrator at the Jardin du Roi.

Rouen, a city of France, capital of the department of Seine-Inferieure and the ancient capital of the province of Normandy, on the Seine, 87 m. N.W. of Paris by rail. Pop. (1906) 111,402. The old city lies on the north bank of the river in an amphitheatre formed by the hills which border the Seine valley. It is surrounded by boulevards. Outside the ellipse formed by these lie the suburbs of Martainville, St Hilaire, Beauvoisine, Bouvreuil and Cauchois; 2½ m. to the east is the industrial town of Darnétal (pop. 6770), and in the level plain on the opposite bank of the Seine is the extensive manufacturing suburb of St Sever with the industrial towns of Sotteville (pop. 18,006) and Petit Quevilly (pop. 14,552) in its immediate vicinity. The city is centrally situated at the junction of three great thoroughfares; the Seine and the St Sever canal to the east, the N.W. to Paris, and the S. to Rouen. It is divided into two sections by the river, the Château and the Lower Town, and it is traversed by the Rue de Paris directly to the airport at Breteuil.

Rouen possesses four railway stations. The central point of the old town is the Place de l’Hôtel de Ville, occupied by the church of St Ouen, the hôtel de ville and an equestrian statue of Napoleon I., and traversed by the Rue de la République which leads from it past the cathedral to the Place de la République and the Quai de Paris. Parallel to this street to the west are the Rue Beauvoisine with its southern continuations, the Rue des Carmes and the Rue Grand-Pont, and the wide and handsome Rue Jeanne d’Arc terminating on the Quai de la Bourse. These thoroughfares, which are all within the boulevards, are crossed at right angles by the Rde la Grosse-Horloge and by the Rue des Thiéris, running from the Place Cauchois to the west of the Place de l’Hôtel de Ville, and passing on the left the Jardin Solferino and the museum.

The cathedral was built on the site of a previous cathedral which was destroyed by fire in 1200, and its construction lasted from the beginning of the 13th century, to which period belong the lateral doors of the west portal, to the beginning of the 16th century, when the Tour de Beurre was completed. The spire surmounting the central tower, which is the highest in France (485 ft.), is modern. The western façade, with its profusion of niches, pinnacles and statues, belongs, as a whole, to the Flamboyant style. But the northern tower, the Tour St Romain, is in the main of the 12th century, its upper stage (with its steep, pointed roof) having been added later. The southern tower, the Tour de Beurre, so named because funds for its building were given in return for the permission to eat butter in Lent, is of a type essentially Norman, and consists of a square tower pierced by high mullioned windows and surmounted by a low, octagonal structure, with a balustrade and pinnacles. The juxtaposition of these two towers, so different in character, is the most striking feature of the main façade, which is notable besides for its width. The portals of the transept are each flanked by two towers and decorated with sculpture and statuary. That to the north, the Portail des Libraires, looks upon the Cour des Libraires, once the resort of the booksellers of Rouen. That to the south is known as the Portail de la Calende. The plan of the church comprises a nave with aisles and lateral chapels, a transept and a choir with ambulatory. The most remarkable part of the interior is the Lady Chapel (1320-20) behind the choir with the tombs (1518-25) of Cardinal Georges d’Amboise and his nephew, the statuary of which, including the kneeling statues of the two cardinals, is of the finest Renaissance workmanship. The chapel also contains the tomb (1566-64) of Louis de Brézé, seneschal of Normandy. Behind the cathedral is the archiepiscopal palace, a building of the 14th and 15th centuries. St Ouen, formerly the church of an abbey dating to the Roman period and reorganized by Archbishop St Ouen in the 7th century, exceeds the cathedral in length as well as in purity of style. In spite of the juxtaposition of the second and third, the Radiant and Flamboyant types of Gothic architecture, the building, as a whole, presents a unity which even the modern façade has failed to mar. It was founded in 1318 in place of a Romanesque church which previously occupied the site and of which the only relic is the chapel in the south transept. The choir alone was constructed in the 14th century. The nave of the church belongs to the 13th century, by the end of which the central tower with its octagonal lantern and four flanking turrets had been erected. The building of the western façade, which is flanked by two towers, was not undertaken till 1846.
The walls of the church are pierced by windows filled with stained glass of the 14th, 15th and 16th centuries and cover more space than is usual even in French Gothic churches. The Portail des Marmousets, the entrance to the south transept, has a projecting porch, behind and above which rises a magnificent rose window. The north façade has no entrance. In the interior, now depopulated of many artistic treasures, there is an organ-case dating from 1630 and a raling of the 18th century surrounding the choir.

The church of St Maclou, behind the cathedral, begun in 1437 and finished early in the 16th century, is a rich example of the Flamboyant style, the characteristics of which are specially displayed in the decoration of the façade and the tracery of the portal with its five arched openings. It is celebrated for carving attributed to Jean Goujon which appears on the western doors and in other parts of the church, and has a handsome organ-loft reached by a graceful open staircase, and a stained glass of the 15th and 16th centuries. The spire, above the central tower is modern and was finished in 1869. Close by the church is the old parish church called the Attre de St Maclou; it is surrounded by wooden galleries of the Renaissance period, supported on stone pillars on which are sculptures representing a dance of death.

The church of St Vincent, near the Seine, is a building of the 16th century and contains the finest stained-glass windows in Rouen; those at the end of the north aisle, by Engrand and Jean le Prince, artists of Beauvais, are the most noted. The stained glass in the churches of St Patrice (16th century) and St Godard (late 15th century) is inferior only to that of St Vincent. Among the less important ecclesiastical buildings of Rouen are the churches of St Gervais, St Romain, St Laurent, St Vivien, and the tower of St André, a relic of an old church of the 13th and 16th centuries.

The most important secular building in Rouen is the Palais de Justice, once the seat of the exchequer and, later, of the parlement of Normandy. It is in the late Gothic style and consists of a main building flanked by two wings. The left wing, known as the Salle des Procureurs, was erected in 1493 and is remarkable for its lofty barrel-roof of timber. South of the Palais de Justice is the Porte de la Grosse Horloge, an arcade spanning the street and surmounted by a large clock of the 15th century with two dials. The Tour de la Grosse Horloge, which rises beside the arcade, was built in 1389. The tower known as the Tour de Jeanne d’Arc was the scene of her trial, and is that remains of the castle built by Philip Augustus early in the 13th century. The Porte Guillaume-Lion, opening on to the Quai de Paris, is a handsome gateway built in 1749.

There are numerous old houses in Rouen in the Gothic and Renaissance styles. The Hôtel de Bourgtheroulde, the most famous of them, is a stone mansion of the 15th century added to in the reign of Francis I, the façades of which are decorated with bas-reliefs representing scenes from the meeting of the Field of the Cloth of Gold and allegories from the Triumphs of Petrarch. Among more modern buildings are the hôtel de ville of the 18th century, adjoining the north side of the church of St Ouen, the Bourse dating from the same period, and the Musée-Bibliothèque constructed in 1880 and containing rich collections of pictures and ceramics and a library with upwards of 133,000 volumes and many valuable MSS. An important museum of antiquities and a museum of natural history are contained in the old convent of the Visitation. A statue of the composer F. A. Boieldieu overlooks the Quai de la Bourse, and one of Pierre Cornelle stands at the extreme extremity of the Ill river; both were natives of the town. At Bourgtheroulde, on a hill on the Seine 2½ miles above Rouen, are the modern church, which is a resort of pilgrims, and the monument to Joan of Arc consisting of three small Renaissance buildings with a statue of the heroine in the principal one.

Rouen is the seat of an archbishop, a prefect, a court of appeal and a court of assizes, and headquarters of the IIth army corps. Its public institutions also include a tribunal of first instance, tribunals of commerce and of maritime commerce, a council of trade-arbitration, a chamber of commerce and a branch of the Bank of France. Among its educational establishments are preparatory schools of medicine and pharmacy, and of higher instruction in science and literature, lycées and training-colleges for both sexes, ecclesiastical seminaries and institutions of higher education in architecture, music and fine arts. All the more important nations have consulates in the city. Rouen is an important centre for trade in wines, spirits, grain and cattle. Grain, wine, coal, timber and petroleum are landed direct from the French coast. There is a large port and in and around it are cotton, brick, sugar, and a distillery.

Renaissance of Justice

There are the Rouen; the organ-case of Godard (late 15th century) comprises the marines docks below the Boieldieu bridge, and the river dock, the timber dock and the petroleum dock above it. There is also a repairing dock. The Seine is tidal beyond Rouen. The port is accessible for ships drawing 19 ft to 22 ft. of water, and its quays have a superficial area of about 123 acres. It is served by the lines of the Orlean, the Western and the Northern railway companies, and these, in addition to the waterways connected with the Seine, make Rouen a convenient centre for the distribution of merchandise.

Ratuma or Ratumacos, the Celtic name of Rouen, was modified by the Romans into Rotomagus, and by the writers of medieval Latin into Rodomum, of which the present name is a corruption. Under Caesar and the early emperors the town was the capital of the Velocasses, a people of secondary rank, and it did not attain to any eminence till it was made the centre of Lugdunensis Secunda at the close of the 3rd century, and a little later the seat of an archbishop. Rouen owed much to its first bishops—Rouen. The reach of the Seine is tidal beyond Rouen. The port is accessible for ships drawing 19 ft to 22 ft. of water, and its quays have a superficial area of about 123 acres. attempts to recapture the town, but they were unsuccessful till 1540 when Somerset, the English commander, was obliged to surrender the principal fortified places in Normandy. During the close of the 15th century and the first half of the 16th, Rouen was the metropolis of art and taste in France and was one of the first places to reflect the influence of the Renaissance. During the wars of religion the arts declined. In 1562 the town was sacked by the Protestants. This did not prevent the League from gaining so firm a footing there that Henry IV. besieged it unsuccessfully and only obtained entrance after his abjuration. The revocation of the edict of Nantes in 1685 lost Rouen many of its richest and most industrious citizens in the Calvinistic emigration. The town suffered less from the excesses of the French Revolution than from the depredations of bandits who, under the Directory, infested the neighbourhood of the city and were not suppressed till the Consulate. During the Franco-German War the city was occupied by the invaders from December 1870 till July 1871, and had to submit to heavy requisitions.

See A. Chérel, Histoire de Rouen pendant l'époque communale (Rouen, 1843); Histoire de Rouen sous la domination anglaise au quinzième siècle (Rouen, 1840); N. Péríaux, Histoire sommaire et chronologique de la ville de Rouen (Rouen, 1874); C. Enlart, Rouen (Paris, 1904).

ROUERGUE (Rouenensis pagus), one of the old provinces of France, was originally inhabited by the Ruheni. It was bounded on the N. by Auvergne, on the S. and S.W. by Languedoc, on the E. by Gévaudan and the Cévennes and on the W. by Quercy. It included (1) the county of Rodez, (2) Haute and Basse Marche; and it was divided between the dioceses of Rodez and Vabres (province d'Alby after this province had been separated from that of Bourges in 1578). Administratively it formed first a stëîkeauste, dependent on Languedoc (capital Villefranche, in the Basse Marche), and later it was attached to the military governments of Guienne and Gascony. It was then part of the departments of Aveyron and of Tarn-et-Garonne. The county of Rodez, after having been in the possession of Toulouse and Carlat, fell in the 14th century into that of Armagnac. Jean II. of Armagnac having served Charles V. faithfully during his wars with England, received from him, in 1374, what were called the four "châtel-levies" with the "Commun de la paix," a tax which had been established there to organize resistance against foreigners. Jean V. of Armagnac was deprived of the county for crime and treason against Louis XI., in 1466, but afterwards it was given back to the Armagnacs, who died without legitimate issue in 1496. Its possession was then disputed between King Francis I. and the duke of Alençon, who at last compromised (1510) the king ceded the county to his sister Marguerite d'Angoulême, who took it as dowry first to the duke of Alençon, and then to her second husband Henri d'Albret, king of Navarre. The county afterwards passed to Jeanne d'Albret, then to Henri IV., and was joined to the crown lands in 1590.

ROUGE ("red," from Lat. rubes), a French name applied to various colouring substances of a brilliant carmine tint, especially when used as cosmetics. The best of these preparations are such as have for their basis earthamine, obtained from the safflower (Carthamus tinctorius). The Chinese prepare a rouge, said to be from safflower, which, spread on the cards on which it is sold, has a brilliant metallic green lustre, but when moistened and applied to the skin assumes a delicate carmine tint. Jeweller's rouge for polishing plate is a fine red iron oxide prepared by calcination from ferrous sulphate (green vitriol).

ROUGET DE LISLE, CLAUDE JOSEPH (1760–1836), French author, was born on the 10th of May 1760, at Lons-le-Saunier (Jura). He entered the army as an engineer, and attained the rank of captain. He was one of those authors whom a single work has made famous. The song which has immortalized him, the Marseillaise, was composed at Strassburg, where Rouget de Lisle was quartered in April 1792. He wrote both words and music in a fit of patriotic excitement after a public dinner. The piece was at first called Chant de guerre de l'armée du Rhin, and only received its name of Marseillaise from its adoption by the Provengal volunteers whom Barbaouroux introduced into Paris, and who were prominent in the storming of the Tuileries. The author was a moderate republican, and was cashiered and thrown into prison; but the counter-revolution set him at liberty. He died at Choisy-le-Roi (Seine et Oise) on the 26th of June 1836. The stirring melody of the Marseillaise and its ingenious adaptation to the words serve to disguise the alternate poverty and bombast of the words themselves. Rouget de Lisle wrote a few other songs of the same kind, and in 1825 he published Chants français, in which he set to music fifty songs by various authors. His Essais en vers et en prose (1797) contains the Marseillaise, a prose tale of the sentimental kind called Adélaïde et Monville, and some occasional poems.

ROUGH CAST (the French equivalent is crépi), in architecture, the exterior coating originally given to the walls of common dwellings and outbuildings, but now frequently employed for decorative effect on country houses, especially those built in half timber. It is a composition of small gravel and sand, mixed with strong lime mortar, and is thrown on the walls already covered with two ordinary coats of plaster. Variety can be obtained on the surface of the wall by small pebbles of different colours, and in the Tudor period fragments of glass were sometimes embedded. The central tower of St. Alban's cathedral, built with Roman tiles from Verulam, was covered with rough cast believed to be coeval with the building. The rough cast was removed about 1870.

ROUHER, ÉUGÈNE (1814–1884), French statesman, was born at Riom (Puy de Dôme) on the 30th of November 1814. He practised law in his native place after taking his degree in Paris in 1835, and in 1846 sought election by his fellow-citizens to the Chamber of Deputies as an official candidate of the Guizot ministry. It was only after the revolution of 1848, however, that he became deputy for the department of Puy de Dôme. Re-elected to the Legislative Chamber in 1849 he succeeded Odilon Barrot as minister of justice, with the additional office of keeper of the seals, which he retained with short intervals until January 1852. From the tribune of the Chamber he described the revolution of February as a "catastrophe," and he supported reactionary legislation, notably the bill (May 31, 1850) for the limitation of the suffrage. After the coup d'état of December 2, 1851, he was entrusted with the redaction of the new constitution, and on his resignation of the office of Minister without a legitimate issue. After the formal establishment of the Empire, Napoleon III. rewarded him by a grant of £40,000 and the estate of Cirey. In 1855 he became minister of agriculture, commerce and public works, and in 1856 senator. He secured for France an excellent system of railways without making them a state monopoly, and he conducted the complicated negotiations for the treaty of commerce with England which was concluded in January 1860, and subsequently arranged similar treaties with Belgium and Italy. In 1863 he became minister president of the Council of State, and on the death of A. A. M. Billault minister of state and chief spokesman of the emperor before the Corps Législatif. Although the government had a great majority in the Chamber, the opposition counted the redoubtable names of Thiers, Berryer and Jules Favre, and government measures were only passed by frequent resort to the closure. Rouher had to defend Napoleon's foreign adventures as well as the free-trade treaties and the extravagances of Baron Haussmann for which he was directly responsible. After an attempted defence of the foreign policy which had aided the aggravidment of Prussia at the expense of Austria, Thiers told him in the Chamber that there were "no more blunders left for him to make." He opposed the abortive Liberal concessions of January 1867, announced in a personal letter from Napoleon III. to himself, and resigned with the rest of the cabinet, only to resume office after a short interval as minister of finance. When concessions became inevitable Rouher, the "vice-emperor," resigned
to make way after six months' interval for Emile Ollivier. He
still fought for reaction in his new office of president of the
Senate. After the fall of the Empire he fled to England, but
returned to France a year later to work for the fortunes of the
prince imperial. After serious disturbances he was elected
member for Ajaccio on the 11th of February 1872, his election
been characterized by the prefect of Corsica as a regular con-
spiracy in favour of the Empire. In the Chamber, where he
subsequently represented Riom, he formed the group of the
Appel au Peuple. His first speech in the House was the occa-
sion (May 21, 1872) of violent attacks by Audiffret-Pasquier
and Gambetta. The death of the prince imperial in 1879 put
an end to the serious chances of the Bonapartist, although
Rouher sought to secure the recognition of Prince Napoleon,
son of the ex-king Jerome, as heir to the imperial honours.
Rouher lost his reason after a stroke of paralysis in 1883, and
died on the 3rd of February 1884.

For an estimate of Rouher, see marquis de Castelane, Les Hommes
etres français du xixe siècle, (1888), and generally the literature
dealing with the Second Empire.

ROULERS (Flemish Roesselare), a town of Belgium, in the
province of West Flanders, 13 m. N.W. of Courtrai. Pop.
(1897) 24,548. It is one of the oldest communes in Belgium,
and was famous for its weavers in the 11th and 12th centuries.
Its prosperity depends on the cultivation of flax and the manu-
facture of linen. The church of St Michael is remarkable for
its lofty tower. Baldwin VIII., count of Flanders, died here in
1120, and in 1794 the French under Pichegu defeated the
Austrians under Clerfayt.

ROULETTE, in mathematics, the locus of a point carried on a
curve which rolls on another (fixed) curve. The name appears
to have been used by Pascal to denote the cycloid (q.v.), which
is the simplest roulette, being traced by a point on the circum-
fERENCE of a circle rolling on a straight line. The trochoids
and epicycloids (q.v.) are also simple roulettes, the latter being
traced points on the circle which rolls on another circle.

See W. H. Besant, Roulettes and Glissettes.

ROULETTE, a gambling game, of French origin. It is one of
the two games played in the gambling-rooms at Monte Carlo,
and the description here given, and the maximum and minimum
stakes are fixed, are to be understood as alternately black and
red, numbered from one to thirty-six, the thirty-seventh
being zero. Pair indicates even numbers, impair odd numbers,
moung includes the numbers from 1 to 18, passe, from 19 to 36. The methods of
staking are innumerable.

The minimum stake is five
francs, which must be placed on the table in the form of a
five-franc piece, and not in smaller change. Rouge, noir,
pair, impair, manque and passe are even chances; i.e. a
stake put upon any of them is paid in corresponding coin
should the player win, the exception being when the little ball
which is spun round the wheel falls into zero, in which case
the even money chances are put "in prison"—that is to say,
laid aside until another spin, when if the bank wins they
are lost, if the player wins he is allowed to retrieve his money.
The maximum in the case of these chances is 6000 francs.
Any one who desires to play en plein puts his stake on one of
the thirty-seven numbers. If the ball falls into the corresponding
number on the wheel, the stake is paid thirty-five times; and
as there are thirty-seven numbers on the board, with the advan-
tage already described of imprisoning the even-money chances
when zero comes up, it will be seen that there is a steady per-
centage in favour of the tables and consequently against the
player. This percentage is of course greatly increased when,
as is often the case, a second zero, called double-zero, is used.
In some gambling-houses there is even a third one, called
Eagle Bird. The maximum stake allowed en plein is 180
francs. The next most daring selection is à cheval, when the
stake is placed on the line separating any two numbers, and if
either of them wins the player is paid seven times his stake,
the even-money chances, except the zero, being lost. Transverse pleins
covers any three numbers in a line, the coin or note being placed
on the line dividing any one of the numbers from the neighbour-
ing even-money chance as, for instance, between 4 and passe, or
6 and manque. A transversal simple covers six numbers, as,
for example, where the line between 4 and 7 joins passe, or
between 6 and 9 joins manque; and if any one of these numbers
wins, five times the value of the stake is paid, the maximum
here being 1200 francs. En carré includes four numbers, the
coin being placed, for instance, on the cross between 1, 2, 4, 5,
or 28, 29, 31, 32; eight times the value of the stake is paid, and
the maximum is 760 francs. The dozens and the columns
are also indicated on the board, the first dozen of course
including 1 to 12. In each of the columns are twelve num-
bers in different order. A stake placed on either a dozen
or a column is paid twice its value, the maximum here being
3000 francs. A stake constantly played is called the quatre
premiers, which includes zero, 1, 2 and 3, the stake being
placed on the line where zero and 2 join passe, or where zero
and 3 join manque. If any one of these four numbers, including zero, wins,
the stake is paid eight times; and four times eight being thirty-
two, there is a greater advantage to the table than when it loses
en plein or on certain other chances. Zero can also be played in combination with any one or two of its neighbours; if with
one of them the stake is paid seventeen times, if with two of
them eleven times. A croupier sits on either side of the wheel;
there is also one at each end of the table, their business being
to assist the players in staking and recovering their winnings.

Behind each of the former pair an official on a high chair super-
vises the table. The croupier whose duty it is to spin the wheel
waits for a time till stakes have been made, and then, exclaiming,
"Messieurs, faites votre jetu!" sets the cylinder in motion,
throwing the ball in the direction contrary to that in which the
wheel revolves. When it is seen that the ball will soon fall at
rest in one of the compartments of the cylinder the croupier
gives the notice, "Rien ne va plus," after which no stakes can
be placed. When the ball finally rests in the compartment,
the croupier announces the number and the even-money chances
that win for him and for his fellows. The player, without any
waiting, then gather in with a rake all the money that has
been lost, after which the winnings are paid and the game
proceeds. At the beginning of play each table is supplied with
a certain large sum. When the bank loses this and is forced to
send for another supply it is said to be "broken."

ROUND (O. Fr. rond, Lat. rotundus, the Fr. is the source also of
Du. rond; Ger., Swed., Dan. and Nor. rund), circular, spherical,
globular. As a substantive, the word has several specific applica-
tions; thus it is used of the rung of a ladder, of a rounded
cross-bar connecting the legs of a chair, of the circuit of the
### ROUNDERS—ROUND TABLE

watch under an officer who patrols the sentries in a fortress, fortified town, camp or other military station, and hence of the beaten or customary course of the pelican, postman, or a tradesman, and of the full course at such a game as golf. Similarly there were old dances called "rounds," in which the dancers stood in a circle or ring. They were popular in the 16th and 17th centuries. Later the name was also applied to country dances where the dancers stood in two lines. For the "round" in music see CANON. A complaint or remonstrance signed by a number of persons is commonly known as a "round robin"; properly such a document should have the signatures arranged in a circle, the idea being that thus the order in which the complainants signed should be unknown. In the 16th century "round robin" was a name of mockery given to the Eucharist.

**ROUNDERS**, an English ball game, probably dating from the 18th century, but not attaining to any popularity before 1800. It was the immediate ancestor of Baseball (q.v.). Up to the year 1880 no special code of rules existed, but the game was played on the green, the field being marked out in a regular pentagon, and the five points, about a yard apart, being divided into halves, the outer half being called the "round perman", the inner half the "round base". The game was wound up when the ball was intercepted by a base, or when the batter was struck out by the first ball struck at him while running between bases. Rounders in its primitive form was more of a romp than a regular game, but it experienced a revival in Scotland and the north of England about the year 1880, when two governing bodies were formed, the National Rounders Association of Liverpool and Vicinity and the Scottish Rounders Association. These, with the later Gloucester Rounders Association, drew up the rules now recognized.

A round ball similar to that used in handball TOOK place, and the rule by which a runner could be put out by hitting him with a thrown ball abandoned. The bat must not exceed 3½ in. in diameter nor 35 in. in length. The game is similar to baseball, but there are several differences. The bases, the most radical being that the batter may be hit in any direction, as in cricket. The original position has been discarded in favour of an elongated diamond, the home-base being at one end and 1st, 2nd and 3rd bases at the other points, where the silent base is situated on the line of 3rd base towards home base. The batter is faced by 6-12 yards. From the former position of 1st base was a 22 yds. That the bowler stands in a space marked off in the centre of the diamond and tosses the ball to the batsman, who must hit every "good" ball, i.e. one that is straight over the home-base and between head and knee. Two bad balls score one for the batsman. If the latter hits the ball he must run to 1st base and then 2nd, and so on 'round to home again, resting at any base; but he may be put out if the batter is struck out by the first ball struck at him while running between bases. Ten players constitute a side and three innings a piece are played, every player batting once in each innings. Each side has its own backstop placed directly behind the batsman, and behind the backstop is placed 1st cover (right), longstop (middle), and 3rd cover (left). The 1st, 2nd and 3rd basemen are stationed at the bases, while behind them in the field are placed the 3rd baseman, the leg man, and the field and 3rd baseman of the opposing team, designated by light wooden posts. An umpire presides over the game. A variation of rounders is Fieldball, invented in 1888, a combination of rounders and cricket, a wicket being placed in front of each base, which is struck by a bat, or tossed behind it by a wicket-keeper, four wickets being placed behind the batter, one at each base and one behind the field. Another variation is called Baseball Rounders, which was invented in 1889 and is practically the same as baseball.

**ROUNDHEAD**, a term applied to the adherents of the parliamentary party in England during the great Civil War. Some of the Puritans, but by no means all, wore the closely cropped round the head, and there was thus an obvious contrast between them and the men of fashion with their long ringlets. "Roundhead" appears to have been first used as a term of derision towards the end of 1641 when the debates in parlia-

<th>Relatives</th>
<th>English poor law, a plan by which the parish paid the occupiers of property to employ the applicants for relief at a rate of wages fixed by the parish. It depended not on the services, but on the wants of the applicants, the employer being repaid out of the poor rate all that he advanced in wages beyond a certain sum. According to this plan the parish in general made some agreement with a farmer to sell to him the labour of one or more paupers at a certain price, paying to the pauper out of the parish funds the difference between that price and the allowance which the scale, according to the price of bread and the number of the family, awarded to him. It received the local name of billet or ticket system from the ticket signed by the overseer which the pauper in general carried to the farmer as a warrant for his being employed, and afterwards took back to the overseer, signed by the farmer, as a proof that he had fulfilled the conditions of relief. In other cases the parish contracted with a person to have some work performed for him by the paupers at a given price, the parish paying the paupers. In many places the roundsmen system was carried out by means of an auction, all the unemployed men being put up to sale periodically, sometimes monthly or weekly, at prices varying according to the time of year, the old and infirm selling for less than the able-bodied. The roundsmans system disappeared on the reform of the poor law in 1834.</th>

</table>

**ROUND TABLE, THE**, in the Arthurian Romance (q.v.), the table round which, in order to avoid quarrels as to precedence, King Arthur's knights are seated, and so applied collectively to the Knights themselves as the title of a mythical order of chivalry. The table, as seen in the round Table is obscure. Geoffrey of Monmouth makes no mention of it, and the earliest record of it is that of Wace, much expanded by his translator, Layamon, who gives a picturesque detailed description of the fight for precedence which took place at Arthur's board on a certain Yuletide day, and the slaughter which ensued. For this slaughter Arthur took summary vengeance, slaying all the kin of the man who started the fight, and cutting off the noses of his women-folk. For the future avoidance of any such scenes a cunning workman of Cornwall offered to make a table which should seat 1600 knights and more, and at which all should be equal. Arthur accepted this offer, and the result was the Round Table, peace and harmony. Wace does not even mention the number of knights. These versions of the pseudo-chronicles practically ascribe the foundation to Arthur; the romances, however, differ. In these either Merlin made the table for Uther Pendragon,
or it had belonged to Leodegrange, king of Cornwall and father of Guenevere, and was given to Arthur on his marriage with that princess. When the founding of the Round Table is ascribed to Merlin it is generally in close connexion with the Grail legend, forming the last of a series of three, founded in honour of the Trinity—the first being the table of the Last Supper, the second that of the Grail, established by Joseph of Arimathea. The number of knights whom the table will seat varies; it might seat twelve or fifty and a hundred and fifty; nowhere, save in Layamon, do we find a practically unlimited power of accommodation. It is also to be noted that whereas, in the pseudo-chronicles, it is the common table of Arthur's court, designed in the interests of peace and unity, in the romances it is a sign of superiority, only the best and most valiant knights being adjudged worthy of a seat at the Round Table. In fact, it has become the equivalent of an order of knighthood, the members of which form a brotherhood bound by oath to succour each other at need and to refrain from fighting among themselves. The membership is not restricted to the knights of Arthur's immediate court and household, knights who are, in all essentials outsiders, appearing but as passing guests at Arthur's board, such as, e.g., Perceval and Tristan, may be elected knights of the Round Table. In two romances, the prose Tristan and the Parzival, the place of the Round Table proper is taken, on a journey, by a sable cloth laid on the ground, round which the knights are seated. In the versions more closely connected with the Grail story the name of the chosen knight appears on his seat, and there is one vacant place, the Siege perilous, eventually to be filled by the Grail winner.

It is obvious that the tradition has passed through several stages, and has varied in the process. The original source is not easy to determine. Dr Lewis Mott has pointed out that "Round Tables" exist in many parts of Great Britain, the name being often associated with circular trenches, or rings of stones, which were demonstrably employed in connexion with the agricultural festivals held at Pentecost, Midsummer and Michaelmas. However this may be, and it seems probable that Dr Mott is right in his identification, the pseudo-chronicles and romance writers certainly had in their minds a genuine table, although, probably, one of magical properties. Thus Layamon's table can seat an indefinite number, and yet it can be carried by Arthur when he rides abroad. On closely examining Layamon's version it seems probable that he had in his mind not merely a circular, but a turning table; he gives it as ground for the quarrel that all the knights wished to sit within; at the table the Cornish workman will make none shall be left without, but they shall sit " without and within, man against man." It is difficult to explain this phrasing in any other hypothesis than that Layamon pictured to himself Arthur's hall as open on one side, and that, on a great feast-day, owing to the number of guests, the table extended beyond the covering afforded by the roof. As the feast took place " on mid-winter's day", the arrogance of those who were without would have made it difficult to obtain the turning workman who devised a circular table, turning on a pivot, with seats affixed, at which the guests sat the one half in turn within, the other without, the hall " man against man." This would make the Round Table analogous to the turning castles which we frequently meet with in romances; and while explaining the peculiarities of Layamon's text, would make it additionally probable that he was dealing with an earlier tradition of folkloric character, a tradition which was probably also familiar to Wace, whose version, though much more condensed than Layamon's, is yet in substantial harmony with this latter. This, too, is certain; the fight for precedence at Arthur's board may be paralleled by accounts of precisely similar quarrels in early Irish literature, e.g. the famous tale of Fleid Bricrend or Bricrend's Feast of the Ultonian cycle.

Recent grail researches have made it most probable that that mysterious sainthood was originally the vessel of the ritual feast held in honour of a deity of vegetation,—Adonis, or another; if the Round Table also, as Dr Mott suggests, derives from a similar source, we have a link between these two notable features of Arthurian tradition, and an additional piece of evidence in support of the view that behind the Arthur of romance there lie not only memories of an historic British chieftain, but distinct traces of a mythological and beneficent hero. Incidentally also it would seem that those versions which connect the table more closely with Arthur are the more correct.

See Wace, Le Roman de Brut, ed. Loroux de Lincy (1836-38), vol. ii. 74-76); Layamon, Brut, ed. Madden, vol. ii. p. 532; A. C. L. Brown, The Round Table before Wace (Boston, 1900); Lewis F. Mott, The Round Table (New York, 1889).

ROUND TOWERS. A peculiar class of round tower exists throughout Ireland; about one hundred and twenty examples once existed; most of these are ruined, but eighteen or twenty are almost perfect. These towers were built either near or adjoining a church; they are of various dates, from perhaps the 8th to the 13th century; though varying in size and detail, they have many characteristics common to all. They are built with walls slightly battering inwards, so that the tower tapers towards the top. The lower part is formed of solid masonry, the one doorway being raised from 6 to 20 ft. above the ground, and so only accessible by means of a ladder. The towers within are divided into several storeys by two or more floors, usually of wood, but in some cases, as at Keneith, of stone slightly arched. The access from floor to floor was by ladders. The windows, which are always high up, are single lights, mostly arched or with a flat stone lintel. In some of the oldest towers they have triangular tops, formed by two stones leaning together. One peculiarity of the door and window openings in the Irish round towers is that the jambs are set slightly in at the base or lower part, so as to taper towards the top, as in the temples of ancient Egypt. The later examples of these towers, dating from the 12th and 13th centuries, are often decorated with chevron, billet and other Norman enrichments round the jambs and arches. The roof is of stone, usually conical in shape, and some of the later towers are crowned by a circle of battlements. The height of the round towers varies from about 60 to 132 ft.; that at Kilkullen was the highest. The masonry differs according to its date,—the oldest examples being built of almost uncut rubble work, and the later ones of neatly jointed ashlar.

Much has been written as to the use of these towers, and the most conflicting theories as to their origin have been propounded. It is fairly certain, however, that they were constructed by Christian monks from the 9th to the 12th century near a small church or chapel, and also because crosses and other Christian emblems frequently occur among the sculptured decorations of their doors and windows. Their original purpose was probably for places of refuge, for which the solid base and the door high above the ground seem specially adapted. They may also have been watch-towers, and in later times often contained bells. Their circular form was probably for the sake of strength, angles which could be attacked by a battering ram being thus avoided, and also because no quoins or dressed stones were needed, except for the openings—an important point at a time when tools for working stone were scarce and imperfect. Both these reasons may also account for the Norman round towers which are so common at the west end of churches in Norfolk, Suffolk and Essex, though these have little resemblance to those of Ireland except in the use of a circular plan. One example exactly like those of Ireland exists in the Isle of Man, within the precincts of Peel Castle. Professor C. F. Smyth, however, held that it was probably the work of Irish builders. There are also three in Scotland, viz. at Egilsay in Orkney, and at Abernethy and Brechin.

Round towers wider and lower in proportion than those of Ireland appear to have been built by many prehistoric races in different parts of Europe. The towers of this class in Scotland are called "brochs"; they average about 50 ft. high and 30 ft. in internal diameter. Their walls, which are usually about 15 ft. thick at the bottom, are built hollow, of rubble masonry, with series of passages one over the other running all round the tower. As in the Irish towers, the entrance is placed at some distance from the ground; and the whole structure is designed as a stronghold. The brochs
appear to have been the work of a pre-Christian Celtic race. Many objects in bronze and iron and fragments of hand-made pottery have been found in and near these towers, all bearing witness of a very early date. (See Anderson, *Scotland in Pagan Times*, 1883, and *Scotland in Early Christian Times*, 1883.) The nuraghi of Sardinia are described in the article on that island. During the 6th century church towers at and near Ravenna were usually built round in plan, and not unlike those of Ireland in their proportions. The finest existing example is that which stands by the church of S. Apollinare in Classe, the old port of the city of Ravenna (see Basilica, fig. 8). It is of brick, divided into nine storeys, with single-light windows below, three-light windows in the upper storeys, and two-light windows in the intermediate ones. The most magnificent example of a round tower is the well-known leaning tower of Pisa, begun in the year 1174. It is richly decorated with tiers of open marble arches, supported on free columns. The circular plan was much used by Moslem races for their minarets. The finest of these is the 13th century minar of Kutb at Old Delhi, built of limestone with bands of marble. It is richly fluted on plan, and when completed was at least 250 ft.

The best account of the Irish round towers is that given by Petrie in his *Ecclesiastical Architecture of Ireland* (Dublin, 1845). See also Keane, *Towers and Temples of Ancient Ireland* (Dublin, 1850); Brach, *Ecclesiastical Architecture of Ireland* (Dublin, 1875); and Stokes, *Early Architecture in Ireland* (Dublin, 1878). (J. H. M.)

**ROUS, FRANCIS (1579-1659), English Puritan, was born at Dittisham in Devon in 1579, and educated at Oxford (Broadgates Hall, afterwards Pembroke College) and at Leiden, graduating at the former in January 1599-70, and at the latter thirteen months afterwards. For some years he lived in seclusion in Cornwall and occupied himself with theological studies, producing among other books *The Arts of Happiness* (1619) and *Testis Veritatis*, a reply to Richard Montagu's *Appello Cacarem*. He entered parliament in 1625 as member for Pembroke, and continued to represent that or some neighbouring west country constituency in such parliaments as were summoned till his death. He obtained many offices under the Commonwealth, among them that of provost of Eton College. At first a Presbyterian, he afterwards joined the Independents. In 1657 he was made a lord of parliament. He died at Acton in January 1658-59. The subjective cast of his piety is reflected in his *Mystical Marriage ... between a Soule and her Saviour* (1635), but he is best known by his metrical version of the Psalms (1643), which was approved by the Westminster Assembly and (in a revised form) is still used in the Scottish Presbyterian churches.

**ROUS, HENRY JOHN (1795-1877), British admiral and sportsman, was born on the 23rd of January 1795, the second son of the 1st earl of Stradbroke. He was educated at Westminster School, and entered the British navy in 1808, serving as a midshipman in the *Cipango*. He was afterwards appointed to the "Bacchante," and received a medal for bravery in various actions and expeditions. In 1823 he was made captain, and served in the Indian and New Holland stations from 1823 to 1829. In 1834 he was appointed to the command of the "Fique," a 36-gun frigate, which ran ashore on the coast of Labrador and was much damaged. Rous, however, brought her across the Atlantic with a sprung foresail and without keel, forefoot or rudder, and though the ship was making 23 ins. of water an hour, Rous, always fond of sport, retired from the navy, and became in 1838 a steward of the Jockey Club, a position which he held almost uninterrupted to his death. In 1855 he was appointed public handicapier. He managed the duke of Bedford's stables at Newmarket for many years, and wrote a work on *The Laws and Practice of Horse Racing* that procured for him the title of "the Blackstone of the Turf." In 1841 he was returned M.P. for Westminster, and in 1846 Sir Robert Peel made him a lord of the admiralty. He died on the 19th of June 1877.

For the naval career of Admiral Rous see O'Byrne, *Naval Biography Dictionary* (London, 1849). A vivid sketch of him as a turf authority will be found in Day's *Turf Celebrities* (London, 1891). **ROUSSEAU, JACQUES (1636-1693), French painter, a member of a Huguenot family, was born at Paris in 1630. He was remarkable as a painter of decorative landscapes and classic ruins, somewhat in the style of Canaletto, but without his delicacy of touch; he appears also to have been influenced by Nicolas Poussin. While young Rousseau went to Rome, where he spent some years in painting the ancient ruins, together with the surrounding landscapes. He thus formed his style, which was artificial and conventionally decorative. His landscape-painting part is pleasing, partly owing to his violent treatment of skies with crude blues and orange, and his chiaroscuro usually is much exaggerated. On his return to Paris he soon became distinguished as a painter, and was employed by Louis XIV. to decorate the walls of his palaces at St Germain and Marly. He was soon admitted a member of the French Academy of the Fine Arts, but on the revocation of the edict of Nantes he was obliged to take refuge in Holland, and his name was struck off the Academy Roll. From Holland he was invited to England by the duke of Montague, who employed him, together with other French painters, to paint the walls of his palace, Montague House (on the site of which is now the British Museum). Rousseau was also employed to paint architectural subjects and landscapes in the palace of Hampton Court, where many of his decorative panels still exist. He spent the latter part of his life in London, where he died in 1693.

Besides being a painter in oils and fresco Rousseau was an etcher of some ability; many etchings by his hand from the works of the Caracci and from his own designs still exist; they are vigorous, though coarse in execution.

**ROUSSEAU, JEAN BAPTISTE (1671-1741), French poet, was born at Paris on the 6th of April 1671; he died at Brussels on the 17th of March 1741. The son of a shoemaker, he was well educated and early gained favour with Boileau, who encouraged him to write. He began with the theatre, for which he had no aptitude. A one-act comedy, *Le Coff*, failed in 1694, and he wrote with his friend with a more ambitious play, *Le Flotateur* (1696), or with the *opéra* *Vénus et Adonis* (1670). He tried in 1700 another comedy, *Le Capricieux*, which had the same fate. He then went with Tallard as an attaché to London, and, in days when literature still led to high position, seemed likely to achieve success. His misfortunes began with a club squabble at the Café Laurent, which was much frequented by literary men, and where Rousseau indulged in lampoons on his companions. A shower of libellous and sometimes obscene verses was written by or attributed to him, and at last he was turned out of the café. At the same time his poems, as yet only singly printed or in manuscript, acquired him a great reputation, due to the dearth of genuine lyrical poetry between Racine and Chénier. He had in 1701 been made a member of the Académie des inscriptions; he had been offered, though he had not accepted, profitable places in the revenue department; he had become a favourite of the libertine but influential coterie of the Temple; and in 1710 he presented himself as a candidate for the Académie française. Then began the second chapter of an extraordinary history of the animosities of authors. A copy of verses, more offensive than ever, was handed round, and gossip maintained that Rousseau was its author. Legal proceedings of various kinds followed, and Rousseau ascribed the libel to Joseph Saurin. In 1712 Rousseau was prosecuted for defamation of character, and, on his non-appearance in court, was condemned for *contumace* to perpetual exile. He spent the rest of his life in foreign countries except for a clandestine visit to Paris in 1735, refusing to accept the permission to return which was offered him in 1716 because it was not accompanied by complete rehabilitation.

Prince Eugène and then other persons of distinction took him under their protection during his exile, and he printed at Soluèvre the first edition of his poetical works. Voltaire and he met at Brussels.
ROUND TOWERS

Irish Round Tower: Clondalkin, Co. Dublin.

East Anglian Round Church-Tower: Little Saxham.

Broch: Mousa, Shetland.

Broch: Keiss Road, Caithness (Interior, Lower Part, Excavated).
in 1722. Voltaire’s Le Pour et le contre is said to have shocked Rousseau, who expressed his sentiments freely. At any rate the latter had then—forward no fiercer enemy than Voltaire. His death elicited from Lefranc de Pomponne an ode of real excellence and one of the most beautiful things of Rousseau’s own. This work is divided, roughly speaking, into two contrasted divisions. One consists of formal and partly sacred odes and canzonets of the stiffest character, of which perhaps the Ode à la fortune is the most famous. They are written in an epic style intentioned licentious and always, or almost always, ill-natured. As an epigrammatist Rousseau is only inferior to his friend Alexis Piron. In the former he stands almost alone. The frigidity of conventional diction and the disgraceful literary mannerisms in which Rousseau had not prevented his odes and canzonets from showing at times true poetical faculty, though cramped, and inadequate to explain his extraordinary vogue. Few writers were so frequently reprinting during their lifetime. But every year, at every session, Darque Harpe had arrived at a true estimate of his real value when he said of his poetry: “Le fond n’est qu’un lieu commun chargé de déclarations et même d’idées fausses.”

Besides the Soleure edition mentioned above Rousseau published another issue of his work in London in 1723. This chief edition since is that of J. A. Amar (vols., 1820), preceded by a notice of his life. M. A. de Latour published (1869) a useful though not complete edition, with notes and a biographical introduction.

ROUSSEAU, JEAN JACQUES (1712–1778), French philosopher, was born at Geneva on the 28th June 1712. His family had established themselves in that city at the time of the religious wars, but they were of pure French origin. Rousseau’s father Isaac was a watchmaker; his mother, Suzanne Bernard, was the daughter of a minister; she died in childbirth, and Rousseau, who was the second son, was brought up in a haphazard fashion, his father being dissipated, violent—tempered and foolish. But he early taught his son to read, and seems to have laid the foundation of the financierism in morals and politics which Rousseau afterwards illustrated with his genius. When the boy was ten years old his father got entangled in a dispute with a fellow-citizen, and being condemned to a short term of imprisonment abandoned Geneva and took refuge at Lyons. The father and son henceforth rarely met. Rousseau was taken charge of by his mother’s relations and was committed to the tutorship of M. Lambertier, pastor at Boissy. In 1724 he was removed from this school and taken into the house of his uncle Bernard, by whom he was shortly afterwards apprenticed to a notary. His master, however, found or thought him incapable and sent him back. After a short time (April 25, 1725) he was apprenticed again, this time to an engraver. He did not dislike the work, but was or thought himself cruelly treated. In 1728 he ran away, the truancy being by his own account unintentional, in the first instance, and due to the fact of the city gates being shut sooner than usual. Then began an extraordinary series of wandering and adventures, for much of which there is no authority but his own Confessions. He first fell in with some proselytes of the Roman faith at Conflans in Savoy, and by them he was sent to Madame de Waren at Annecy, a young and pretty widow who was himself a convert. Her influence, however, which was to be so great, was not immediately exercised, and he was passed on to Turin, where there was an institution specially devoted to the reception of neophytes. His experiences here were unsatisfactory, but he abjured dully and was rewarded by being presented with twenty francs and sent about his business. He wandered about in Turin for some time, and at last established himself as footman to a Madame de Vercellis. Here he overheard the famous incident of the theft of a ribbon, of which he was accused, somewhat fictitiously. But, though he kept his place by this piece of cowardice, Madame de Vercellis died not long afterwards and he was turned off. He found another place with the Comte de Gouven, but lost this also through coxcombry. Then he resolved to return to Madame de Waren at Annecy. The chronology of all these events, as narrated by himself, is somewhat obscure, but they seem to have occupied about three years.

Even then Rousseau did not settle at once in the anomalous but to him charming position of domestic lover to this lady, who, nominally a converted Protestant, was in reality, as many women of her time were, a kind of delit, with a theory of noble sentiment and a practice of libertinism tempered by good nature. It used to be held that in her conjugal relations she was more sinned against than sinning. But modern investigations seem to show that M. de Vuarrens (which is said to be the correct spelling of the name) was an unfortunate husband, and was deserted and robed by his wife. However, she welcomed Rousseau kindly, thought it necessary to complete his education, and he was sent to the seminarists of St Lazare to be improved in classics, and also to a music master. In one of his incomprehensible freaks he set off for Lyons, and, after abandoning his companion in an epileptic fit, returned to Annecy to find Madame de Waren gone. Then for some months he relapsed into the life of vagabondage, varied by improbable adventures, which (according to his own statement) he so often pursued. Hardly knowing anything of music, he attempted to give lessons and a concert at Lausanne; and he actually taught at Neuchâtel. Then he became, or says he became, secretary to a Greek archimandrite who was travelling in Switzerland to collect subscriptions for the rebuilding of the Holy Sepulchre; then he went to Paris, and, with recommendations from the French ambassador at Soleure, saw something of good society; then he returned on foot through Lyons to Savoy, hearing that Madame de Waren was at Chambré. This was in 1732, and Rousseau, who for a time bad unimportant employments in the service of the Sardinian crown, was shortly installed by Madame de Waren, whom he still called Maman, as amant en titre in her singular household, wherein she diverted herself with him, with music and with chemistry. In 1736 Madame de Waren, partly for Rousseau’s health, took a country house, Les Charmettes, a short distance from Chambré. Here in summer, and in the town during winter, Rousseau led a delightful life, which he has delightfully described. In a desultory way he did a good deal of reading, but in 1738 his health again became bad, and he was recommended to go to Montpellier. By his own account this journey to Montpellier was in reality a voyage à Cythère in company with a certain Madame de Larnage. This being so, he could hardly complain when on returning he found that his official position in Madame de Waren’s household had been taken by a person named Vintzenzer. He was, however, less likely than most men to endure the position of second in command, and in 1740 he became tutor at Lyons to the children of M. de Mably, not the well-known writer of that name, but his and Condillac’s elder brother. But Rousseau did not like teaching and was a bad teacher, and after a visit to Les Charmettes, finding that his place there was finally hopeless, he once more went to Paris in 1741. He was not without recommendation. But a new system of musical notation which he thought he had discovered was unfavourably received by the Académie des sciences, where it was read in August 1742, and he was unable to obtain pupils. Madame Dupin, however, to whose house he had obtained the entry, procured him the honourable if not very lucrative post of secretary to M. de Montaigu, ambassador at Venice. With him he stayed for about eighteen months, and has as usual infinite complaints to make of his employer and some strange stories to tell. At length he threw up his situation and returned to Paris (1745).

Up to this time—that is to say, till his thirty-third year—Rousseau’s life, though continuously described by himself, was of the kind called subterranean, and the account of it must be taken with considerable allowances. From this time, however, he is more or less in view; and, though at least two events of his life, his quarrel with Diderot on the subjects of dispute, its general history can be checked and followed with reasonable confidence. On his return to Paris he renewed his relations with the Dupin family and with the literary group of Diderot, to which he had already been introduced by M. de Mably’s letters. He had an opera, Les Muses galantes, privately represented; he copied music for money, and received from Madame Dupin and her son-in-law M. de Franqueul a small but regular salary as secretary. He lived at the Hotel St Quentin for a time, and once more arranged for himself an equivocal
domestic establishments. His mistress, whom towards the close of his life he married after a fashion, was Thérèse de Vasseur, a servant at the inn where Voltaire took his last journey. Thérèse was Rousseau's friend, his confidant, his literary executor, and the mother of his three surviving children. He and his wife were disinherited by their joint son, who had married after the death of his mother, and who was the last of Rousseau's legitimate children. Despite his mistresses and his numerous affairs, Rousseau's personal life was relatively uneventful. He was a man of simple tastes, with a love for nature and a deep appreciation of beauty. His philosophy was deeply influenced by his personal experiences and his observations of society.

Rousseau received his primary education at the Dijon academy, which had founded his fame, and the subject of the essay was "The Origin of Inequality," on which he had been writing since 1750. The essay was dedicated to the former in merit. During a visit to Geneva in 1754, Rousseau saw his old friend and love Madame de Genlis (now reduced in circumstances and having lost all her charms), while after abjuring his abjuration of Protestantism he was enabled to take up his freedom as citizen of Geneva, to which his birth entitled him and of which he was proud. Shortly afterwards, returning to Paris, he spent a little more than a year there, but it was an important year. Here he wrote La Nouvelle Héloïse; here he indulged in the passion which that novel partly represents, his love for Madame d'Hudetot, sister-in-law of Madame d'Épinay, a lady young and amiable, but plain, who had a husband and a lover (St. Lambert), and whom Rousseau's devotion seems to have partly pleased and partly annoyed. Here too arose the obscure triangular quarrel between Diderot, Rousseau and Frederick Melchior Grimm, which ended Rousseau's sojourn at the Hermitage. The supposition least favourable to Rousseau is that it may have been due to pure love of clearness, the habit of blijing tolerance and indignation at the obligations which he was nevertheless always ready to incur. That most favourable to him is that he was expected to lend himself in a more or less complaisant manner to assist and cover Madame d'Épinay's adulterous affection for Grimm. At any rate, Rousseau quitted the Hermitage in the winter of 1757-58, and established himself at Montlouis in the neighbourhood.

Hitherto Rousseau's behaviour had frequently made him enemies, but his writings had for the most part made him friends. The quarrel with Madame d'Épinay, with Diderot, and through them with the philosophes party reversed this. In 1758 appeared his Lettre à d'Allemont contre les spectacles, written in the winter of the previous year at Montlouis. This was at once an attack on Voltaire, who was giving theatrical representations at Les Délices, on D'Alembert, who had condemned the prejudice against the stage in the Encyclopédie, and on one of the favourite amusements of the society of the day. Voltaire's strong point was not forgiveness, and, though Rousseau no doubt exaggerated the influence of his enemies, the spectacle is not without an obtrusive and obnoxious to the philosophes coterie as to the orthodox party. He still, however, had no lack of patrons—he never had though his perversity made him quarrel with all in turn. The amiable duke and duchess of Luxembourg, who were his neighbours at Montlouis, made his acquaintance, or rather forced theirs upon him, and he was industrious in his literary work—indeed, most of his best books were produced during his stay in the neighbourhood of its author in effigy. Rousseau resented himself by printing his clever satire entitled Lettre d'un symphoniste à l'Académie Royale de Musique à ses camarades de l'orchestre. His Lettre à M. Burney is of a similar character. His articles on music in the Encyclopédie deal very superficially with the subject; and his Dictionnaire de musique (Geneva, 1757), though admirably written, is not trustworthy, either as a record of facts or as an expression of opinion. His articles on music are less certain than his musical education is painfully apparent, and his compositions betray an equal lack of knowledge. But to his refined taste is as clearly displayed there as is his literary power in the Lettres et dictionnaire. His first opera, Les Muses galantes, privately prepared at the house of La Poppinière, attracted very little attention; but Le Désir du village, given at Fontainebleau in 1752, and at the Académie in 1753, achieved a great and well-deserved success. Though very unequal, and exceedingly simple both in character and execution, the score is written throughout in the most refined taste. His Pygmalion (1775) is a melodrama without singing. Some posthumous fragments of another opera, Daphnis et Chloe, were printed in 1790; and in 1781 appeared Les Considérations sur les termes de la musique, or the Art of Music, which is written in a very solid and other fugitive pieces of very unequal merit. The popular air known as "Rousseau's Dream" is not contained in this collection, and cannot be traced back farther than J. B. Cramer's celebrated Variations. M. Castil-Blaze has accused Rousseau of extensive plagiarisms (or worse) in Le Désir du village and Pygmalion, but apparently without sufficient cause.

(W. S. R.)
Montmorency. A letter to Voltaire on his poem about the Lisbon earthquake embittered the dispute between the two men, which was subsequently published. *La Nouvelle Héloïse* appeared in the same year (1760), and it was immensely popular. In 1762 it appeared in London and Paris, as well as in the Low Countries and at Dusseldorf. For the latter the author received 6000 livres, for the *Contrat Social*.

Julie, ou, *La Nouvelle Héloïse*, is a novel written in letters describing the lives of a man of low position and a girl of rank, her subsequent marriage to a respectable freethinker of her own station, the mental agonies of her lover, and the partial appeasement of the distresses of the lovers by the influence of noble sentiment and the good offices of a philanthropic Englishman. It is too long, the sentiment is overstrained, and several moralists have accused it of a certain complaisance in dealing with amatory errors; but it is full of pathos and knowledge of the human heart. The *Contrat social*, as its title implies, endeavours to base all government on the consent, direct or implied, of the governed, and indulges in much ingenious argument to get rid of the practical inconveniences of such a suggestion. *Émile*, the second title of which is *De l'Éducation*, is much more of a treatise than of a novel, though a certain amount of narrative interest is kept up throughout. Rousseau's title implies, that the term of the comparative prosperity which he had enjoyed for nearly ten years was at hand. The *Contrat social* was obviously anti-monarchic; the *Nouvelle Héloïse* was said to be immoral; and the sentimental deism of the "Philosophie du vicaire Savoyard" in *Émile* irritated equally the philosophes and the church. On June 11, 1762, *Émile* was condemned by the parlement of Paris, and two days previous Madame de Luxembourg and the prince de Conti gave the author information that he would be arrested if he did not fly. They also furnished him with means of flight, and he made for Vervan in the territory of Bern, whence he transferred himself to Motiers in Neuchâtel, which then belonged to Prussia. Frederick II. was not indisposed to protect the persecuted when it cost him nothing and might bring him fame, and in Marshal Keith, the governor of Neuchâtel, Rousseau found a true and firm friend. He was, however, unable to be quiet or to practise any of those more or less pious frauds which were customary at the time with the unscrupulous in the station of a low beggar who has a past. He fled from the council of the city of Geneva, which thereupon expelled him. He then went through France and Switzerland to England, where he was received with complaisance. The council of Geneva attacked the council and the Geneva constitution unswarngly. All this excited public opinion against him, and gradually he grew unpopular in his own neighbourhood. This unpopularity is said on uncertain authority to have culminated in a nocturnal attack on his house. At any rate he thought he was menaced if he was not, and migrated to the Île St Pierre in the Lake of Bienna, where he once more for a short, and the last, time enjoyed that idyllic existence which he loved. But the Bernese government ordered him to quit its territory. He was for some time uncertain where to go, and thought of Corsica (to join Paoli) and Berlin. But finally David Hume offered him, late in 1763, an asylum in England, and he accepted. He passed through Paris, where his presence was tolerated for a time, and landed in England on January 13, 1766. Thérèse travelled separately, and was en-rolled to the station of a low beggar who has a past. She made Rousseau's acquaintance. Here he had once more the chance of settling peaceably. Severe English moralists like Johnson thought but ill of him, but the public generally was not unwilling to testify against French intolerance, and regarded his sentimentalism with favour. He was lionized in London to his heart's content and discontent, for it may truly be said of Rousseau that he was equally indignant at neglect and intolerant of attention. When, after not a few displays of his strange humour, he professed himself tired of the capital, Hume procured him a country abode in the house of Mr Davenport at Wotton in Derbyshire. Hence, though the place was bleak and lonely, he might have been happy enough, and he actually employed himself in writing the greater part of his *Confessions*. But his habit of self-tormenting and tormenting others never left him. His own caprices interposed some delay in the conferring of a pension which George III. was induced to grant him, and he took this as a crime of Hume's. The publication of a spiteful letter (really by Horace Walpole, one of whose worst deeds it was) in the name of the king of Prussia made Rousseau believe that plots of the most terrible kind were on foot against him. Finally he quarrelled with Hume because the latter would not acknowledge all his own friends and Rousseau's supposed enemies of the philosophic circle to be rascals. He remained, however, at Wotton during the year and through the winter. In May 1767 he fled to France, addressing letters to the lord chancellor and to General Conway, which can only be described as the letters of a lunatic. He was received in France by the marquis de Mirabeau (father of the great Mirabeau), of whom he had often had, enough, then by the prince de Conti at Try. From this place he again fled and wandered about for some time in a wretched fashion, still writing the *Confessions*. He constantly quarrelled with the English, never suspecting, the helpers. In the summer of 1770 he returned to Paris, resumed music-copying, and was on the whole happier than he had been since he had to leave Montlouis. He had by this time married Thérèse de Vasseur, or had at least gone through some form of marriage with her.

Many of the best-known stories of Rousseau's life date from this last time, when he was tolerably accessible to visitors, though clearly half-insane. He finished his *Confessions*, wrote his *Dialogues* (the interest of which is not quite equal to the promise of their curious sub-title, *Rousseau juge de Jean Jacques*), and began his *Rêveries du promeneur solitaire*, intended as a sequel and complement to the *Confessions*, and one of the best of all his books. It should be said that besides these, which complete the list of his principal works, he has left a very large number of minor works and a considerable correspondence. During this time he lived in the Rue Platière, which is now named after him. But his suspicions of secret enemies grew stronger rather than weaker, and at the beginning of 1778 he was glad to accept the invitation of de Girardin, the rich financier, and went to reside at Ermontville. The country was beautiful; but his old terrors revived, and his woes were complicated by the alleged inclination of Thérèse for one of M. de Girardin's stable-boys. On July 2nd he died in a manner which has been much discussed, suspicions of suicide being circulated at the time by Grimm and others.¹

There is little doubt that for the last ten or fifteen years of his life, if not from the time of his quarrel with Diderot and Madame d'Épinay, Rousseau was not wholly sane—the combined influence of late and unexpected literary fame, and of constant solitude and discomfort acting upon his excitable temperament so as to overthrow the balance, never very stable, of his fine and acute but unrobust intellect. He was by no means the only man of letters of his time who had to submit to something like persecution. Fréron on the orthodox side had his share of it, as well as Voltaire, Helvétius, Diderot and Montesquieu on that of the innovators. But Rousseau had not, like Montesquieu, a position which guaranteed him from serious danger; he was not wealthy like Helvétius; he had not the wonderful superciliousness with which even his came to be admired; he had no fortune, and would probably have defended Voltaire himself; and he lacked entirely the "bottom" of Fréron and Diderot. When he was molested he could only shriek at his

¹ The local inquiry into the death, on the following day, resulted in a certificate that he died of apoplexy; but the story that he shot himself persisted. In December 1807 Rousseau's coffin in the Pantheon was opened, and M. Berthelot, who examined the skull, found no trace of injury by a bullet; and on the whole there is no reason to doubt the verdict of the original inquiry at Ermontville.

(H. Ca.)
enemies and suspend his friends. His moral character was undoubtedly weak in other ways than this, but it is fair to remember that but for his astounding Confessions the more disgusting parts of it would not have been known, and that these Confessions were written, if not under hallucination, at any rate in circumstances entitling the self-condemned criminal to the benefit of considerable doubt. If Rousseau had held his tongue, he might have stood lower as a man of letters; he would pretty certainly have stood higher as a man. He was, moreover, really sinned against, if still more sinning. The conduct of Grimm to him was certainly bad; and, though Walpole was not his personal friend, a worse action than his famous letter, considering the well-known idiosyncrasy of the subject, would be difficult to find. It was his own fault that he saddled himself with the Le Vasseurs, but their conduct was probably, if not certainly, ungrateful in the extreme. Only excuses can be made for him; but the excuses for a man born, as Hume after the quarrel said of him, “without a skin” are numerous and strong.

His peculiar reputation increased after his death. During his life his personal particularities and the fact that his opinions were nearly as obnoxious to the one party as to the other worked against him, but it was not so after his death. The men of the Revolution regarded him with something like idolatry, and his literary merits conciliated many who were far from idolizing him as a revolutionist. His style was taken up by Bernardin de Saint Pierre and by Chateaubriand. It was employed for purposes quite different from those to which he had himself applied it, and the reaction triumphed by the very arms which had been most powerful in the hands of the Revolution. Byron’s fervid panegyric enlisted on his side all who admired Byron—that is to say, the majority of the younger men and women of Europe between 1820 and 1850—and thus different sides of his tradition were continued for a full century after the publication of his chief books. His religious unorthodoxy was condoned because he never scoffed; his political heresies, after their first effect was over, seemed harmless from the very want of logic and practical spirit in them, while part at least of his literary secret was the common property of almost every one who attempted literature.

In religion Rousseau was undoubtedly what he has been called above—a sentimental deist; but no one who reads him with the smallest attention can fail to see that sentimentalism was the essence, desim the accident of his creed. In his time orthodoxy at once generous and intelligent hardly existed in France. There were ignorant persons who were sincerely orthodox; there were intelligent persons who pretended to be so. But between the time of Massillon and D’Agasseau and the time of Lamennais and Joseph de Maistre the class of men of whom in England Berkeley, Butler and Johnson were representatives did not exist in France. Little inclined by nature to any but the emotional side of religion, and utterly undis- ciplined in any other by education, course of life, or the general tendency of his time opinion, Rousseau naturally took refuge in the nebulous kind of natural religion which was fashionable and convenient. If his practice fell far short even of his own arbitrary standard of morality, as much be said of persons far more dogmatically orthodox.

In politics, on the other hand, Rousseau was a sincere and, as far as in him lay, a convinced republican. He had no great tincture of learning, he was by no means a profound logician, and he was impulsive and emotional in the extreme—characteristics which in political matters predispose the subject to the preference of equality above all political requisites. He saw that under the French monarchy the actual result was the greatest misery of the greatest number, and, he did not look much further. The Contrat social is for the political student one of the most curious and interesting books existing. Historically it is null; logically it is full of gaping flaws, practically its manipulations of the volonté de tous and the volonté générale are clearly insufficient to obviate anarchy. But its mixture of real eloquence and apparent cogency is exactly such as always carries a multitude with it, if only for a time. Moreover, in some minor branches of politics and economics Rousseau was a real reformer. Visionary as his educational schemes (chiefly promulgated in Émile) are in parts, they are admirable in others, and his protest against mothers refusing to nurse their children hit a blot in French life which is not removed yet, and has always been a source of weakness to the nation.

But it is as a literary man pure and simple—that is to say, as an exponent rather than as an originator of ideas—that Rousseau is most noteworthy, and that he has exercised most influence. The first thing noticeable about him is that he defies all customary and mechanical classification. He is not a dramatist—his work as such is insignificant—nor a novelist, for, though his two chief works except the Confessions are called novels, Émile is one only in name, and La Nouvelle Héloïse is as a story diffuse, proy and awkward to a degree. He was without command of poetic form, and he could only be called a philosopher in an age when the term was used with such meaningless laxity as was customary in the 18th century. If he must be classed, he was before all things a describer—a describer of the passions of the human heart and of the beauties of nature. In the first part of his vocation the novelists of his own youth, such as Marivaux, Richardson and Prévost, may be said to have shown him the way, though he improved greatly upon them; in the second he was almost a creator. In combining the two and expressing the effect of nature on the feelings and of the feelings on the aspect of nature he was absolutely without a forerunner or a model. And, as literature since his time has been chiefly differentiated from literature before it by the colour and tone resulting from this combination, Rousseau may be said to hold, as an influence, a place almost unrivaled in literary history. The defects of all sentimental writing are noticeable in him, but they are palliated by his wonderful feeling, and by the passionate sincerity even of his insincere passages. Some cavils have been made against his French, but none of much weight. And in his critical passions there have been many since the famous "Volea de lacampagne" of the Confessions, as the description of the isle of St. Pierre in the Revues, as some of the letters in the Nouvelle Héloïse and others, he had achieved absolute perfection in doing what he intended to do. The reader, as it has been said, may think he might have done something else with advantage, but he can hardly think that he could have done this thing better.

(B. C. A.)

BIBLIOGRAPHY.—The dates of most of Rousseau’s works published during his lifetime have been given above. The Confessions and Émile are, what they claim to be, the first works attempted by persons concerned, and which the author did not intend to be published until the end of the century, appeared in Geneva in 1782. In the same year and the following appeared a complete edition in forty-seven small volumes. There have been many since, the most important of them being that of Musset-Pathay (Paris, 1823). Some unpublished works, chiefly letters, were added by Bosscha (Paris, 1858) and Streckeisen Mouton (Paris, 1861). See also the latter’s Rousseau’s life and art (Geneve, 1865). Works of Rousseau are available in English:

The chief biographies are: in French that of Saint Marc Girardin (1874), in English the Life by Viscount Morley. But the materials for his biography are so controversial and so personal—his own Confessions and his memoirs of associates—worse than open to the malevolent attitude of Grimm and Diderot; and her studies of the documents undoubtedly qualifies a good many of the assumptions that have been made on the strength of evidence which is at best indirect, by the late Madame Lamennais. Of late, by Mr. Macdonald, and others, and while Mrs Macdonald’s researches have done much to suggest a rehabilitation of Rousseau’s veracity they have not definitely been accepted to an extent which would justify the rewriting of these other lives in her sense. Rousseau de Genève à l’Hermilage, 1712-57 (1908).
ROUSSEAU, PIERRE ÉTIENNE THÉODÈRE (1812-1867), French painter of the Barbizon school, was born in Paris on the 15th of April 1812, of a bourgeois family which included one or two artists. At first he received a business training, but soon displayed aptitude for painting. Although his father regretted the decision at first, he became reconciled to his son leaving business, and throughout the artist's career, struggled to support his son in every way. The outcome of all his conflicts with the Salon authorities. Théodore Rousseau shared the difficulties of the romantic painters of 1836 in securing for their pictures a place in the annual Paris exhibition. The whole influence of the classically trained artists was against them, and not until 1848 was Rousseau adequately presented to the public. He had exhibited one or two unimportant works in the Salon of 1831 and 1834, but in 1836 his great work "La Descente des vaches" was rejected by the vote of the classic painters; and from then until the revolution of 1848 he was persistently refused. He was not without champions in the press, and under the title of "le grand refusé" he became known through the writings of Théophile Gautier, the critic who afterwards resided in England and wrote under the name of Bürger. During these years of artistic exile Rousseau produced some of his finest pictures. They include: "Chestnut Gatherers" (now in the Louvre), "Hour-Frost" (now in America); and in 1851, after the reorganization of the Salon in 1848, he exhibited his masterpiece, "The Edge of the Forest" (also in the Louvre), a picture similar in treatment to, but slightly varied in subject, from the composition called "A Glade in the Forest of Fontainebleau," in the Wallace collection at Hertford House.

Up to this period Rousseau had lived only occasionally at Barbizon, but in 1848 he took up his residence in the forest village, and spent most of his remaining years in the vicinity. He was now at the height of his artistic power, and was able to obtain fair sums for his pictures (but only about one-tenth of their value thirty years after his death), and his circle of admirers increased. He was still ignored by the authorities, for while Diaz was made Chevalier of the Legion of Honour in 1851, Rousseau was left undecorated at this time, but was nominated shortly afterwards. At the Exposition Universelle of 1855, where all Rousseau's rejected pictures of the previous twenty years were gathered together, his works were acknowledged to form one of the finest of the many splendid groups there exhibited. But during his lifetime Rousseau never really conquered French taste, and after an unsuccessful sale of his works by auction in 1861, he contemplated leaving Paris for Amsterdam or London, or even New York. Misfortune then overtook him: his wife, who had been a source of constant anxiety for years, became almost hopelessly insane; his aged father looked constantly to him for pecuniary assistance; his patrons were few. Moreover, while he was temporarily absent with his invalid wife, a youth living in his home (a friend of his family) committed suicide in his Barbizon cottage; when he visited the Alps in 1863, making sketches of Mont Blanc, he fell dangerously ill with inflammation of the lungs; and when he returned to Barbizon he suffered from insomnia and became gradually weakened. He was elected president of the fine art jury for the 1867 Exposition. His disappointment at being passed over in the distribution of the higher awards told seriously on his health, and in August he was seized with paralysis. He slightly recovered, but was again attacked several times during the autumn. Finally, in November, he began to sink, and he died, in the presence of his lifelong friend, J. F. Millet, on the 22nd of December 1867.

Rousseau's other friend and neighbour, Jules Dupré, himself an eminent landscape painter of Barbizon, relates the difficulty Rousseau experienced in knowing when his picture was finished, and how he, Dupré, would sometimes take away from the studio a finished canvas on which Rousseau was labouring too long. Millet, the peasant painter, for whom Rousseau had the highest regard, was much with him during the last years of his life, and at his death Millet took charge of the insane wife. Rousseau was a good friend to Diaz, teaching him how to paint trees, for up to a certain point in his career Diaz considered he could only paint figures.

Rousseau's pictures are always grave in character, with an air of exquisite melancholy which is powerfully attractive to the lover of landscapes. They are well finished when they are finished. No other pictures of Rousseau spent so long a time in working up his subjects that his absolutely completed works are comparatively few. He left many canvases with parts of the picture realized in detail and with the remainder somewhat vague; and also a good number of sketches and water-colour drawings. His pen work in monochrome on paper is rare; it is particularly searching in quality. There are a number of fine pictures by him in the Louvre, and the Wallace collection contains one of his most important Barbizon pictures. There is also an example in the Ioniades collection at the Victoria and Albert Museum.

ROUSSEAU DE LA ROTTIERE, JEAN SIMÉON (b. 1747), French decorative painter, was the youngest son of Jules Antoine Rousseau, 'sculpteur du Roi.' The territorial addition to his patronymic has never been explained, but it is known to have been in use when he was little more than a boy. He studied at the Académie Royale, where we find him in September 1768 winning the medal given to the best painter of the quarter. He appears with his brother Jules Hugues to have been employed from an early date by his father for the decorative work executed by the family at Versailles. There has been some controversy among the authorities as to the respective shares of father and son in these works, but many of the attributions are fairly determined by dates, Jules Antoine Rousseau having been at work at Versailles for years before the birth of his famous son. The "Bains du Roi," the "Salon de la Méridienne," part of the bedchamber of Madame Adélaïde, and the "Garde-robe of Louis XVI." were among the achievements which there can be little doubt were shared in by Rousseau de la Rottière. His most individual and most famous undertaking was, however, the decoration of the lovely "Boudoir de Madame de Sévigny," now at the Victoria and Albert Museum. This little room, 14 ft. long, 10 ft. wide and 16 ft. high, was removed from the house in the Rue de Saint Louis, in the Marais. The Seigneur de Sévigny, who was hereditary "Trésorier-général de l'Extraordinaire des guerres," under Louis XVI., married his cousin Anne Marie Louise de Pange, a favourite maid-of-honour of Marie Antoinette, and the story runs that his wife and the queen, desiring to give him a surprise, had the room decorated during his absence from Paris. It was purchased for the museum for 6,000 francs. The wall paintings of this sumptuous room came from the hand of Rousseau de la Rottière; the overdoor and part of the ceiling were executed by Lagrenée le jeune; the architect was Ledoux; the grey marble figures of aged men on either side of the fireplace were sculptured by Cledion; the mounts of the chimney-piece are apparently from the chisel of Gouthière. The date of the room is assigned to 1781-82, and Jean Siméon's authorship of much of its decoration is rendered certain by his own still existing sketch. The decoration is Pompeian in feeling, and in the main its taste is admirable; the execution is of the highest excellence. The tall narrow panels are painted in medallions with amorini; festoons and bouquets of flowers fill every available space; the shutters are painted with doves and shepherdesses. Lagrenée's pictures in the upper lunettes represent the elements; upon the ceiling is Jupiter enthroned within a deep blue border. The perfection of detail, the unity of the whole composition, the dexterity with which so small a chamber, lofty out of proportion to its length and width,
ROUSSILLON—ROUTLEDGE

has been picked out with recessed arches, the tenderness of its scheme of colour, combine to produce an exquisite effect. It is a melancholy reflection that M. de Sévilly, whom his wife and Marie Antoinette combined to surprise with this chef-
d'œuvre, was guillotined, and that his wife, whose sitting-room it was, was condemned to die with him and with Madame Élisabeth de France, whom they had befriended, but was saved, against her will, by the princess, who made a false declaration as to her condition. She had two subsequent husbands, and lost them both in little more than two years. She herself lived less than five years after her delivery by the fall of Robespierre. There is no information as to Rousseau's later life. The last known mention of him is in 1792.

ROUSSILLON, one of the old provinces of France. It now forms the greater part of the department of Pyrénées Orientales (q.v.). It was bounded S. by the Pyrenees, W. by the county of Foix, N. by Languedoc and E. by the Mediterranean. The province derived its name from a small place near Perpignan, the capital, called Ruscino (Rosceliona, Castel Rossello), for a conference of the district formed part of the Roman province of Gallia Narbonensis from 121 B.C. to A.D. 402, when it was ceded with the rest of Septimania to Theodosic II., king of the Visigoths. His successor, Amalaric, on his defeat by Clovis in 531 retired to Spain, leaving a governor in Septimania. In 719 the Saracens crossed the Pyrenees, and Septimania was held by them until their defeat by Pippin in 756. On the invasion of Spain by Charlemagne in 778 he found the borderlands wasted by the Saracenic wars, and the inhabitants hiding among the mountains. He accordingly made grants of land to Visigothic refugees from Spain, and founded several monasteries, round which the people gathered for protection. In 792 the Saracens again invaded France, but were repulsed by Louis, king of Aquitaine, whose rule extended over all Catalonia as far as Barcelona. The different portions of his kingdom in time grew into alodial fiefs, and in 843 Sunaire II. became the first hereditary count of Roussillon. But his rule only extended over the eastern part of what became the later province. The western part, or Cerdagne, was ruled in 900 by Miron as first count, and one of his grandsons, Bernard, was the first hereditary count of the middle portion, or Béasu. In 1111 Raymond-Bérenger III., count of Barcelona, inherited the fief of Béasu, to which was added in 1117 that of Cerdagne; and in 1172 his grandson, Alfonso II., king of Aragon, united Roussillon to his other states on the death of the last count, Gerard II. The counts of Roussillon, Cerdagne and Béasu were not sufficiently powerful to resist the influence of the Saracens, who, during the early years, had been devoted to furthering the welfare of their people. Under the Aragonese monarchs the progress of the united province still continued, and Collioure, the port of Perpignan, became a centre of Mediterranean trade. But the country was destined to pay the penalty of its position on the frontiers of France and Spain in the long struggle for ascendancy between these two powers. By the treaty of Corbeil (1258) Louis IX. surrendered the sovereignty of Roussillon and the ancient countship of Barcelona to Aragon, and from that time until the 17th century the province ceased to belong to France. James I. of Aragon had wrested the Balearic Isles from the Moors and left them with Roussillon to his son James (1276), with the title of king of Majorca. The consequent disputes of this monarch with his brother Pedro III. of Aragon were not lost sight of by Philip III. of France in his quarrel with the latter about the crown of the Two Sicilies. On Philip's death his son, Charles, invaded Aragon, and his army into Spain, but retreating died at Perpignan in 1285. James then became reconciled to his brother, and in 1311 was succeeded by his son Sancho, who founded the cathedral of Perpignan shortly before his death in 1324. His successor James II. refused to do homage to Philip VI. of France for the seigniory of Montpellier, and applied to Pedro IV. of Aragon for aid. Pedro not only refused it, but on various pretences declared war against him, and seized Majorca and Roussillon in 1344. The province was now again united to Aragon, and enjoyed peace until 1462. In this year the disputes between John II. and his son about the crown of Navarre gave Louis XI. of France an excuse to support John against his subjects, who had risen in revolt. Louis took the province, and the province having been paid to him for 300,000 crowns, was occupied by the French troops until 1493, when Charles VIII. restored it to Ferdinand and Isabella. During the war between France and Spain (1496-98) the people suffered equally from the Spanish garrisons and the French invaders. But dislike of the Spaniards was soon effaced in the pride of sharing in the glory of Charles V., and in 1542, when Perpignan was besieged by the dauphin, the Roussillonnais remained true to their allegiance. Afterwards the decay of Spain was France's opportunity, and on the revolt of the Catalans against the Castilians in 1641, Louis XIII. espoused the cause of the former, and the treaty of the Pyrenees in 1659 secured Roussillon to the French crown.

form some of the writings of Washington Irving, Fenimore Cooper, Bulwer Lytton and Benjamin Disraeli. He also brought out a number of shilling books in "Routledge's Universal Library." Routledge died in London on the 13th of December 1888. After being styled Routledge, Warne & Routledge, his firm changed its name to that of George Routledge & Sons. A branch of the business was established in New York in 1854.

ROUVIER, MAURICE (1842— ), French statesman, was born at Aix on the 17th of April 1842, and spent the early years of his manhood in business at Marseilles. He supported Gambetta's candidature there in 1867, and in 1870 he founded an anti-Imperial journal, L'Égalité. Becoming secretary general of the prefecture of Bouches-du-Rhône in 1870–71, he refused the office of prefect. In July 1871 he was returned to the National Assembly for Marseilles at a by-election, and voted steadily with the Republican party. He became a recognised authority on finance, and repeatedly served on the Budget Commission as reporter or president. At the general elections of 1882 after the fall of the Ferry cabinet he was returned to the chamber on a programme which included the separation of Church and State, a policy of decentralization, and the imposition of an income-tax. He then joined Gambetta's cabinet as minister of commerce and the colonies, and in the 1883–85 cabinet of Jules Ferry he held the same office. He became premier and minister of finance on the 31st of May 1887, with the support of the moderate republican groups, the Radicals holding aloof in support of General Boulanger, who began a violent agitation against the government. Then came the scandal of the decorations in which President Grévy's son-in-law Daniel Wilson figured, and the Rouvier cabinet fell in the attempt to screen the president. Rouvier's opposition in his capacity of president of the Budget Commission was one of the causes of the defeat of the Floquet cabinet in February 1889. In the new Tirard ministry formed to combat the Boulangist agitation he was minister of finance. Then, when he renounced his cabinet and left the Chamber, he formed the cabinet of the Douanier, the Louvet and the Ribot cabinets, 1890–91. His relations with Cornélius Herz and the baron de Reinach compelled his retirement, however, from the Ribot cabinet at the time of the Panama scandals in December 1892. Again, in 1902, he became minister of finance, after nearly ten years in exclusion from office, in the Radical cabinet of M. Combes; and on the fall of the Combes ministry in January 1905 he was invited by the president to form a new ministry. In this cabinet he at first held the ministry of finance. In his initial declaration to the chamber the new premier had declared his intention of continuing the policy of the late cabinet, pledging the new ministry to a policy of conciliation, to the consideration of old age pensions, an income-tax, separation of Church and State. Public attention, however, was chiefly concentrated on foreign policy. During the Combes ministry M. Delcassé had proved the extent of understanding with Spain on the Moroccan question, and had established an understanding with England. His policy had aroused German jealousy, which became evident in the asperity with which the question of Morocco was handled in Berlin. At a cabinet meeting on June 5th it is said that M. Rouvier reproached the Foreign Minister with impudence in the matter of Morocco, and after a heated discussion M. Delcassé gave in his resignation. M. Rouvier himself took the portfolio of foreign affairs at this anxious juncture. He, after critical negotiations, secured on July 8th an agreement with Germany accepting the international conference proposed by the sultan of Morocco on the assurance that Germany would recognize the special nature of the interest of France in maintaining order on the frontier of her Algerian empire. Lengthy discussions resulted in a new convention in September, which contained the programme of the proposed conference, and in December M. Rouvier was able to make a statement of the whole proceedings in the chamber, which received the assent of all parties. M. Rouvier's government did not long survive the presidential election of 1906. The disturbances arising in connexion with the Separation Law were skilfully handled by M. Clemenceau to discredit the ministry, which gave place to a cabinet under the direction of M. Sarrien.

ROVERETO, the most important industrial town in the southern or Italian-speaking portion of the Austrian province of Tirol, though its population (which in 1900 was 16,180, Italian-speaking and Romanist) is less than that of Trent. It is also the principal town of the administrative district of Rovereto. Built on the left bank of the Adige, in the widest portion of the Val Lagarina (the name given to the Adige valley from Acquaviva, above Rovereto, to the Italian frontier), it is divided into two parts by the Leno torrent. It is on the Brenner railway, by which it is 135 m. S.W. of Trent and 42½ m. N. of Verona. Save in the newer quarter of the town, the streets are narrow and crooked, several being named after the most distinguished native of the place, Antonio Rosmini-Serbati (q.e.). The finest church is that of Santa Maria del Carmine, the old 14th century church now serving as a sacristy to that built from 1678 to 1750. The church of San Marco dates from the 13th century. The town is dominated by the castle (now used as barracks), which was reconstructed in 1492 by the Venetians, after it had been burnt in 1487 by the count of Tirol. The staple silk industry (which dates from the 16th century) has declined, the number both of filande (establishments wherein the cocoons are unwound) and of filatoie (those wherein the silk is spun) having diminished.

In 1332 the emperor Lothair found the passage of the gorge above the site of the town barred by a castle, which he took and gave to one of his Teutonic followers, the ancestor of the Castelbarco family. Towards the middle of the 13th century that family obtained by marriage the lands of the Lizzana family (whose castle rises S. of the town), and in 1300 practically founded the town and surrounded it with walls. In 1415 it was taken by the Venetians, who in 1487 successfully resisted, at Calliano, an attempt to take it made by the count of Tirol and the bishop of Trent. In 1509, at the outbreak of the war between the League of Cambrai, the town gave itself voluntarily to the emperor Maximilian, to whom it was ceded formally by Venice in 1517, and next year incorporated with Tirol. South of Rovereto is the village of Marco, near which are certain natural remains (either those of a landslip that occurred in 883, or of a glacier moraine) believed to have been described by Dante (Inf. xii. 4–9), who is said to have spent part of the year 1304, during his exile from Florence, in the castle of Lizzana, between Marco and Rovereto.

(R. A. B. C.)

ROVIGNO, a seaport of Austria, in Istria, 75 m. S. of Trieste by rail. Pop. (1900) 10,205, mostly Italian. It is situated on the west coast of Istria, and possesses an interesting cathedral, built on the summit of the promontory Monte di Sant' Eufemia. Its campanile, built after the model of the famous campanile in Venice, is crowned with a bronze statue of St Eufemia, the patron saint of the town, whose remains are preserved in the church. It contains a station of the Berlin Aquuduct, with a small reservoir, and on the southern side of the old town are three small lakes. In the neighbourhood are vineyards, which produce the best wine in Istria, and olive gardens, while its hazel-nuts are reputed the finest in the world. Rovigno is the principal centre of the Austrian tunny and sardine fishery. The industries, in addition to shipbuilding and the preservation of fish, include the manufacture of tobacco, cement, macaroni and similar preparations, and flour. There is an active export trade. Its inhabitants are renowned seamen. Rovigno is the ancient Atrapsnum or Rubium, and according to tradition it was originally built on an island, Cissa by name, which disappeared during the earthquakes about 737. Rovigno passed definitively into the hands of the Venetians in 1330, and it remained true to the republic till the treaty of Campo Formio (1797).

ROVIGO, a town of Venetia, Italy, capital of the province of Rovigo. It stands on the low ground between the lower Adige and the lower Po, 50 m. by rail S.W. of Venice and 27 m. S.S.W. of Padua, and on the Adigetto Canal, 17 ft. above sea-level. Pop. (1901) 6038 (town); 16,735 (commune). It is a station
ROVUMA—ROWE

on the line between Bologna and Padua, with branches to Legnago and Chioggia. The architecture of the town bears the stamp both of Venetian and of Ferrarese influence. The cathedral church of Santo Stefano (1696) is of less interest than La Madonna del Soccorso, an octagon with a fine campanile, begun in 1594 by Francesco Zambelarino of Bassano, a pupil of Palladio. The town hall contains a library including some rare early editions, belonging to the Accademia de' Concordi, founded in 1580, and a fair picture gallery enriched with the spoils of the monasteries. The Palazzo Roncalli is a fine Renaissance building by Sanmicheli (1555). Two towers of its medieval castle remain. Wool, silk, linen and leather are among the local manufactures.

Rovigo (Neo-Latin Rhodigium) appears to be mentioned as Rodigo in 836. It was selected as his residence by the bishop of Adria on the destruction of his city by the Huns. From the 11th to the 14th century the Este family was usually in authority; but the Venetians took the place by siege in 1452 and retained possession of it by the peace of 1494, and though the Este more than once recovered it, the Venetians, returning in 1514, retained possession till the French Revolution. In 1866 the city was made a duchy in favour of General Savary. The Austrians in 1815 created it a royal city. (T. As.)

ROVUMA, a river in East Africa, forming during the greater part of its course the boundary between German and Portuguese territory. The lower Rovuma is formed by the junction in 11° 25' S., 38° 31' E. of two branches of nearly equal importance, the longer of which, the Lujenda, comes from the south-west, the other, which still bears the name Rovuma, from the west. Its source lies on an undulating plateau, 3000 ft. high, immediately to the east of Lake Nyasa, in 10° 45' S., 35° 40' E., the head-stream flowing first due west before turning south and east. In its eastward course the Rovuma flows near the base of the escarpment of an arid sandstone plateau to the north, from which direction the streams, which have cut themselves deep channels in the plateau edge, have almost all short courses. On the opposite bank the Rovuma receives, besides the Lujenda, the Mzimje and Luchulingo, flowing in broad valleys running from south to north. The Lujenda rises in close proximity to Lake Chilia, in the small Lake Chiuta (1700 ft.), the swamps to the south of this being separated from Chilia only by a narrow wooded ridge. The stream which issues from Chiuta passes by a swampy valley into the narrow Lake Amaramba, from which the Lujenda finally issues as a stream 80 yds. wide. Lower down it varies greatly in width, containing in many places long wooded islands which rise above the flood level, and are often inhabited. The river is fordable in many places in the dry season. At its mouth it is about a mile wide. The lower Rovuma, which is often half a mile wide but generally shallow, flows through a swampy valley flanked by plateau escarpments containing several small backwaters of the river. The mouth, which lies in 10° 28' S., 40° 30' E., is entirely in German territory, the boundary near the coast being formed by the parallel of 10° 40'. The length of the Rovuma river is about 500 m.

FRANCIS JOHNSON (c. 1527-1580), Scottish reformer, was born near Stirling and educated in that town and at St Andrews, where he began to practise as an advocate in the consistorial court. In 1559 he was sent to Rome in the interests of John Hamilton, archbishop of St Andrews, and attracted the notice of the highest authorities, who, when his failing health drove him back to Scotland in 1558, nominated him papal nuncio to inquire into the spread of heresy in that country. That inquiry ultimately led him to change his faith. Much influenced by Knox's preaching, he joined the reformers and in April 1560 was admitted minister of Kennoway in Fife, and in July of the same year minister of the Old or Middle Church at Perth. He was one of the commission of six who drew up the "Confession of Faith" and the "First Book of Discipline," and during the struggle with Queen Mary was often employed on important engagements. He was moderator of the Church Assembly at Edinburgh in July 1567 and at Perth in the follow-

December, and again in Edinburgh 1576 and Stirling 1578. Meanwhile he helped to compile the "Second Book of Discipline," and became more than ever opposed to the Episcopal system of church government. He was a considerable scholar and is said to have been the first to teach Hebrew in Scotland. He died at Perth on the 16th of October 1580.

His son JOHN ROW (1568–1646), minister of Carnock, wrote a Historie of the Kirk of Scotland 1558 to 1637, which was continued to 1639 by his son, the third John Row (c. 1598-c. 1672), rector of the Perth grammar school and then (appointed by Cromwell) principal of King's College, Aberdeen, who, with his father and grandfather was a famous Hebraist, but left the Church of Scotland to become an Independent minister. This Historie was published by the Wodrow Society and by the Maitland Club in 1842.

ROWE, NICHOLAS (1674–1718), English dramatist and miscellaneous writer, son of John Rowe (d. 1692), barrister and serjeant-at-law, was baptized at Little Barford in Bedfordshire on the 30th of June 1674. Nicholas Rowe was educated at Westminster School under Dr Busby. He became in 1688 a King's Scholar, and entered the Middle Temple in 1691. On his father's death he became the master of an independent fortune. His first play, The Ambitious Stepmother, the scene of which is laid in Persepolis, was produced in 1700, and was followed in 1702 by Tamerlane. In this play the conqueror represented William III., and Louis XIV. is denounced as Bajazet. It was for many years regularly acted on the anniversary of William's landing at Torbay. The Fair Penitent (1703), an adaptation of Massinger and Field's Fatal Dowry, was pronounced by Dr Johnson to be one of the most pleasing tragedies in the language. It occurs the famous character of Lothario, whose name passed into current use as the equivalent of a rake. Calista is said to have suggested to Samuel Richardson the character of Clarissa Harlowe, as Lothario suggested Lovelace. In 1704 Rowe tried his hand at comedy, producing The Biter at Lincoln's Inn Fields. The play is said to have amused no one except the author, and Rowe returned to tragedy in Ulysses (1706). The Royal Convert (1707) dealt with the persecutions endured by Aribert, son of Hengist and the Christian maiden Ethelinda. The Tragedy of Jane Shore, which was played at Drury Lane with Mrs Oldfield in the title-role in 1714, ran for nineteen nights, and kept the stage longer than any of his other works. The Tragedy of Lady Jane Grey followed in 1715. Rowe's friendship with Pope, who speaks affectionately of his vivacity and gaiety of disposition, led to attacks inspired by the publisher Edmund Curll, the best known of these being The New Rehearsal, or Bays the Younger, containing an Examen of Seven of Rowe's Plays, by Charles Gildon. Rowe acted as under-secretary (1709–11) to the duke of Queensberry when he was principal secretary of state for Scotland. On the accession of George I. he was made a surveyor of customs, and in 1715 he succeeded Nahum Tate as poet laureate. He was also appointed clerk of the council to the prince of Wales, and in 1718 was nominated by Lord Chancellor Parker as clerk of the presentations in Chancery. He died on the 8th of December 1718, and was buried in Westminster Abbey. He was twice married, and his widow received a pension from George I. in 1739 in recognition of her husband's translation of Lucre. This verse translation, or rather paraphrase of the Pharsalia, was called by Samuel Johnson "one of the greatest productions in English poetry," and was widely read, running through eight editions between 1718 and 1807.

Rowe was the first modern editor of Shakespeare. It is unfortunate that he based his text (6 vols., 1709) on the corrupt Fourth Folio, a course in which he was followed by later editors. We owe to him the preservation of a number of Shakespearean traditions, collected for him at Stratford by Thomas Betterton. These materials he used with considerable judgment in the memoir prefixed to the Works. Moreover, his practical knowledge of the stage suggested technical improvements. He divided the play into acts and scenes on a reasonable method,
noted the entrances and exits of the players, and prefixed a list of the dramatis personae to each play. Rowe wrote occasional verses addressed to Godolphin and Halifax, adapted some of the odes of Horace to fit contemporary events, and translated the Caractères de La Bruyère and the Callipatrida of C. Quillet. He also wrote a memoir of Boyle prefixed to a translation of the Lutrin.

Rowe's Works were printed in 1727, and in 1736, 1747, 1756, 1766 and 1792; his occasional poems are included in Anderson's and other collections of the British poets.

ROWEL (from O. Fr. rouel or roel, dim. of roue, Lat. rota, wheel), the name of the small revolving wheel or disk with radiating points forming the termination of a rider's spur. The earliest rowels probably did not revolve but were fixed. They appear on monuments of the 13th century, as in the great seal of Henry III. of England, but the older "prick" spurs remained the standard form till the 14th century (see Spur). In veterinary science, the word is used of a small disk of leather or other material used as a seton.

ROWING (O. Eng. rivan, to row, cf. Lat. remus, Gr. ῥηπιός, oar), the act of driving forward or propelling a boat (q.v.) along the surface of the water by means of oars.

History.—The earliest historical records describe battles and naval engagements in which the ships were propelled by oars. There must, of course, have been from time to time friendly trials of speed between these ancient craft, such as that described by Virgil in the fifth book of the Aeneid, but there is no record in classical or even in medieval times of rowing having been indulged in solely as a recreation, or as a means of promoting athletic contest. The absence of any element of competition is sufficient to account for the fact that the boats, the oars, and the method of rowing of the 17th century differed but little from those of the earliest times.

The history of Great Britain abounds in instances of the use of the oar. The ancient Britons propelled themselves in coracles of wickerwork covered with skins, by means of paddles rather than oars, but the Saxons were expert oarsmen, as also were the Danish and Norwegian invaders. It is recorded by William of Malmesbury that Edgar the Peaceable was rowed in state on the river Dee by eight tributary kings, himself acting as coxswain.

During the 11th and 12th centuries, when roads were often impassable, a considerable use was made of the various rivers of England for the transmission of both passengers and merchandise; and, until the introduction of coaches, the nobility and gentry who had mansions and watergates on the banks of the Thames relied almost entirely upon their boats and elaborately fitted barges as a means of conveyance from place to place.

This use of boats and barges as a means of conveyance for merchandise and passengers provided a means of livelihood for a class of professional oarsmen known as bargemen or watermen. They were professionals, not in the sense of professional athletes, but because they made their living by rowing and navigating passenger and other craft along on the waters and across the Thames. Watermen as a class are mentioned in history as early as the 13th century. The distress occasioned to them by the long frosts is referred to in the chronicles of that period. They are mentioned as having been employed to row the barons and their retinues to Runnymede for the signing of the Magna Carta by King John, and about the same time several of the city companies established barges for the purposes of processions and for rowing on the Thames. It is stated by Fabian that in 1454 "Sir John Norman, then lord mayor of London, built a noble barge at his own expense and was rowed by watermen with silver oars, attended by such of the city companies as possessed barges, in a splendid manner." The lord mayor's procession by water to Westminster was annual until 1856, the state barge of the lord mayor being a magnificent species of shallow rowed by watermen, while those of the city companies were propelled by a double bank of oars in the fore half, the after part consisting of a cabin which somewhat resembled that of a gondola. In 1547 and in 1592 acts of parliament were passed for the regulation of watermen and their boats and fares upon the Thames (2 Henry VIII. cap. vii. and 2 and 3 Ph. & Mar. cap. xvi.), and from the terms of these statutes there can be no doubt that there were in the 15th century a considerable body of men who lived by the "trade of Rowing" as it is there called. During the 16th and 17th centuries there were no doubt competitions from time to time between these watermen, but the first actual mention of boat-racing is the record of the establishment in 1715 of Doggett's Coat and Badge, Mr Thomas Doggett, who may fairly be described as the founder of modern boat-racing, was a celebrated comedian. He established a fund to provide an annual prize of a waterman's coat with a large silver badge on the arm. The race was founded in honour of the house of Hanover and to commemorate the anniversary of "King George L's happy accession to the throne of Great Britain." The contest was to take place at the beginning of August and on the Thames between six young watermen who were not to have exceeded the time of their apprenticeship by more than twelve months. Although the first race took place in 1715 the names of the winners have not been preserved since 1752. Doggett's Coat and Badge is still awarded to the victor of the boat race and other details having been slightly modified. It is entirely controlled and managed by the Fishmongers' Company.

The first English regatta (Ital. regata)—an entertainment introduced, as the Annual Register, from Venice—of which we have evidence, took place on the Thames off Ranelagh Gardens in 1775. Great public interest seems to have been taken in the spectacular aspect of this pageant, the barges of the lord mayor and the city companies being present, but there is no record of the competing wager boats or of the names of the watermen who took part in the races.

About the years 1800 to 1810 there are instances of matches between watermen for stakes presented by gentlemen who no doubt made wagers upon the result, and from these professional wager matches it was but a short step to sporting matches between the gentlemen themselves. When once the "gentleman amateur," as he was called, appeared, his evolution, from the sportsman who occasionally rowed a match against a friend, or against time, for a wager, to the amateur oarsman of the present day, was not slow. The amateur regatta got its beginning about the year 1800 on the Thames at Westminster and it has flourished as a branch of athletic sport, and has spread to every quarter of the globe.

Rowing in the United Kingdom.—The earliest rowing clubs in England were small groups of oarsmen who combined to purchase a six-oared or eight-oared boat for the purpose of racing. The club was called by the same name as the ship it possessed, and at the commencement of the 19th century the principal clubs in existence upon the Thames were the "Star," the "Arrow," the "Shark" and the "Siren." The two latter have long since disappeared, but the "Star" and the "Arrow" combined about the year 1818 and founded the Leander Club, an institution which after varying fortunes has for many years been recognized as the premier rowing club of the world.

The earliest contemporary record of boat-racing is the Water Ledger of Westminster School, which commences in the year 1813 with a list of the crew of the six-oared boat "Fly." In 1811 Eton had a ten-oared boat and three boats with eight oars, but there is no existing record of a race until 1817. In 1818 Eton challenged Westminster School to row a boat from Kew Bridge against the tide; but the race was stopped by the authorities, and it was not until 1829 that the first contest between the two schools took place. Between 1829 and 1847 there were eight matches between Eton and Westminster. The race was revived for a few years in the sixties, and in the year 1868 the state of the lower towpath was such that the Westminster boys moved their boathouse first to Wandsworth and then to Putney. This arrangement was found to be inconvenient, and shortly afterwards Westminster rowing came to an
end. Eton rowing, on the other hand, has continued to prosper, and for many years it has been the greatest “nursery” of first-class oarsmen. Since 1861 the Eton College Boat Club has never failed to enter a crew at Henley Regatta.

At Oxford the records of periodical races between college boats begin as early as 1815, and those of Cambridge a few years later. The first contest between eight-oared crews representing the two universities took place at Henley-on-Thames in June 1829. The second contest was not until 1836, and was rowed from Westminster to Putney. In 1837 and 1838 the universities were unable to make a match, and in each of those years a race was rowed between Cambridge and the Leander Club, which had thus early become the premier club of the tideway. It was not always easy in the early days of boat-racing for the university boat clubs to agree as to the conditions and time of the match, but on several occasions when the universities had been unable to meet on the tideway they fought their battle whilst competing for the Grand Challenge Cup at Henley Regatta. Since 1836 the Oxford and Cambridge boat race has been an annual event. It is rowed about a week or ten days before Easter from Putney to Mortlake over what is known as the championship course, a distance of 4½ miles. The race is rowed with the flood-tide, and occupies as a rule a time varying between 19 and 22 minutes. The time occupied by a crew in covering this course depends a great deal more upon the conditions of wind and tide than upon the excellence, or the reverse, of the crew. The crew of each university is selected by a president, usually one of the senior members of the last crew, who is elected at the first meeting in the summer term and holds office for a year. Thus the university race comes at the end of his term of office, and he has every opportunity during the summer and autumn of studying the material which will be at his disposal for the formation of a crew in the ensuing spring. The aquatic arrangements at the two universities are very much alike. The university year begins in October. During the winter term the freshmen are instructed in the elements of rowing, while the senior men are engaged in practising for the University (inter-collegiate) Fours, a race which takes place early in November. During the latter portion of the term the president of the University Boat Club is engaged in selecting and coaching the trial eights, two picked crews comprising the bulk of the material available for the formation of the university crew. The trial eight races are rowed in the beginning of December, that of Cambridge on the O. and C. Club’s Boathouse on the common at Moulseford, neither the Cam nor the Isis being wide enough for two crews to race abreast. During the whole of the Easter term the university crews are engaged in practice and training for the University Boat Race. The attention of the remainder of the rowing men at the universities is devoted to training for the bumping races known at Oxford and Cambridge respectively as the Torpids and Lent Races. Each college is represented in these races, and no oarsman who has rowed in the first boat of his college during the previous summer is qualified to compete. The boats start at fixed distances apart, and each boat endeavours to bump the boat in front of it, and to avoid being bumped by the boat behind. When a bump is effected, the two boats involved draw to the side, and the next night the successful boat starts in front of its victim. Each spring the boats start in the order in which they finished the previous year. The races last for six nights at Oxford and four at Cambridge. In the summer term the important bumping races between the best crews of each college take place. They are known as “The Eights” at Oxford and “The May Races” at Cambridge. To attain the position of “Head of the River” in these races is the summit of a college boat club’s ambition.

The great arena of rowing contests is Henley Royal Regatta. It was founded in 1839 at a public meeting held in the town hall at Henley-on-Thames, at which it was decided to raise a subscription and purchase two challenge cups, the Grand Challenge Cup to be rowed for annually in eight-oared boats open to all amateur crews, and the Town Challenge Cup for four-oared crews residing within 5 miles of Henley. The first regatta was held on the 14th of June 1839, and was a most successful affair, the Grand Challenge Cup being won by the Trinity Boat Club, Cambridge. In 1840 another district race was added, and in 1841 the Stewards Challenge Cup for four oars was added to the programme, open to competition upon the same conditions as the Grand Challenge Cup. There have now for many years been eight events at the regatta, four of which are open to all amateurs, viz. the Grand Challenge Cup for eight oars, the Stewards Challenge Cup for fours, the Silver Goblets for pair oars founded in 1845, and the Diamond Sculls for single scullers founded in 1844. The races for which the entry is restricted are the Ladies Challenge Plate for eight oars (founded 1845) and the Visitors Challenge Cup for four oars (founded 1847), which are open to crews from schools and colleges in the United Kingdom; also the Thames Challenge Cup for eight oars (founded 1868) and Wyfold Challenge Cup for four oars (founded 1855). The rule as to entry for the Thames Cup is that no one who has won the Grand Challenge or Stewards Cup may compete, nor may any one enter for this race and for the Grand or Stewards Cups in the same year. The rule for the Wyfold Cup is the same, except that a competitor may also enter for the Grand Challenge Cup.

The original regatta course was from the upper end of the Temple Island to Henley Bridge, but a change was made in 1866 so as to avoid the corner at the finish. The races now start at the lower end of the island and finish at the upper end of the grounds of Phyllis Court. The course is 1 mile 550 yards in length and about 110 ft. in width. The races are rowed against the stream, and the time usually occupied by the winning crew of the Grand Challenge Cup is within a few seconds of 7 minutes. In 1843 took place the famous “seven-oar” victory of Oxford. At the eleventh hour one of the Oxford crew was incapacitated by illness. Their opponents, the Cambridge Subscription Rooms Club, refused to allow them to introduce a substitute, and the Oxford men gained undying fame by winning the Grand Challenge Cup with seven oars.

Ten years later (1853) there was a magnificent race between Oxford and Cambridge in the Grand Challenge Cup, the former winning by 18 inches. In 1862 there was a dead heat in the final heat of the Diamond Sculls between Mr E. D. Brickwood and Mr W. B. Woodgate. In 1878 occurred the memorable contest between Mr T. C. Edwards-Moss and Mr G. W. Lee (U.S.A.) in a heat for the Diamond Sculls which was won by the former, who rowed a famous stroke. In 1892 there was a second dead heat with the Thames R.C., began a series of victories in the Grand Challenge Cup, winning the cup on seven occasions in the next ten years. In 1892 the Diamond Sculls left England for the first time, having been won by Mr J. J. K. Ooms of Holland. In 1895 a crew representing Cornell University, U.S.A., entered for the Grand Challenge Cup and were drawn in their heat against the Leander Club. Owing to a misunderstanding between the starter and the Leander crew, the latter failed to start, and the Cornell crew rowed on to the finish without offering to return to the start, a proceeding which caused no little comment at the time. On the following day they were defeated by Trinity Hall, Cambridge, the ultimate winners. In 1897 the Grand Challenge Cup was won by 2 ft. by New College, Oxford, in the record time of 6 min. 51 secs., after a desperate race with Leander. The feature of the next ten years was the persistency with which colonial and foreign crews endeavoured to carry off the principal prizes of the regatta, and the invasion culminated in 1905 by the capture of the Grand Challenge Cup by a crew from the Club Nautique de Gand, Belgium. On this occasion the Leander Club was not represented, but in 1907 the Belgians repeated their victory after defeating a strong Leander crew in one of the heats. In 1903 Mr Herbert Steward, the chairman of the regatta committee, published a detailed record of the regatta from its commencement, which gives a complete history of the meeting and an account of every race.

Henley regatta is rowed “in accordance with” the rules of
ROWING

the Amateur Rowing Association, a body which has control of all other amateur rowing in England. The Henley Stewards and the Amateur Rowing Association (or A.R.A.) are in complete harmony. Their rules are identical in all particulars, but the Stewards being the older body are not subject to the A.R.A., and in the improbable event of a difference occurring they would be entitled to act independently. The A.R.A. was formed in 1882 for the purpose of drawing up a definition of an "amateur," and for the purpose of having a body who could if necessary select a national representative crew to meet any foreign or colonial invaders. It has long since dropped the latter portion of its original programme, and the A.R.A. as at present constituted is an association to which all the principal amateur boat clubs are affiliated. Its objects are to maintain the standard of amateur oarsmanship and to promote the interests of boat racing. It is governed by a committee which occupies in the British rowing world a position not unlike that of the stewards of the Jockey Club in racing matters. The constitution and objects of the A.R.A. are clearly defined in the rules, and their definition of an amateur is so much stricter than that of some other countries that it is advisable to set it out in extenso. It is as follows:

No person shall be considered an amateur oarsman, sculler or coxswain—
1. Who has ever rowed or steered in any race for a stake, money or entrance fee;
2. Who has ever knowingly rowed or steered with or against a professional for any prize;
3. Who has ever taught, pursued or assisted in the practice of athletic exercises of any kind for profit;
4. Who has ever been employed in or about boats or in manual labour for money or wages;
5. Who is or has been by trade or employment for wages a mechanic, artisan or labourer, or engaged in any menial duty;
6. Who is disqualified as an amateur in any other branch of sport.

The rules of the A.R.A. also comprise the "Laws of Boat Racing," which govern the race from start to finish; and the "Rules for Regattas," which deal with a large number of matters such as the definition of the different classes of oarsmen, seniors, juniors and maidens, the making of entries, the powers of regatta committees, &c.

A large number of regattas are held under these rules in all parts of the country during the summer months. There are also several matches and other competitions rowed under special rules, the most important of these being the Wingfield Sculls (founded 1830), or amateur championship of the Thames, rowed in the month of July over the championship course from Putney to Mortlake (4 1/2 m.).

If the number of entries at Henley Regatta, the extension of the sphere of influence of the A.R.A. and the public interest in the Oxford and Cambridge Boat Race, may be taken as tests, rowing has more than held its own among the various competing forms of recreation in the world of British amateur athletic sport.

Rowing in the United States.—The earliest record of a boat race in the United States is that of a contest in light barges in the year 1811 between the "Knicker-bocker" of New York and the "Invincible" of Long Island, in which the former was successful. The evolution from racing in heavy pleasure boats to racing in specially constructed craft proceeded with great rapidity, and by the year 1834 a large number of small clubs in New York had combined, under the title of the Castle Garden Boat Club Association. In 1837 the first regatta took place at Poughkeepsie, the race being between "six-oars" for a prize of $200. In those days there was no real distinction in America between amateur and professional, and in spite of rules and definitions the distinction between one who is qualified as an amateur and one who is not has remained in America much less certain and precise than in the United Kingdom.
